# Music Encoding Initiative Guidelines

## The Music Encoding Initiative Guidelines

Version 5.0.0-dev (#17f1091), generated on 20 June 2023

Editors-in-chief: Johannes Kepper, Perry D. Roland

Editors: Benjamin W. Bohl (Chapter 2), Margrethe Bue (Chapter 3), Johannes Kepper (Chapters 1, 11, 12, 14), David Lewis (Chapter 7), Fabian Moss (Chapter 10), Stefan Münnich (Chapter 13), Klaus Rettinghaus (Chapter 4), Kristina Richts-Matthaei (Chapter 3), Agnes Seipelt (Chapter 10), Martha E. Thomae (Chapter 5), Reinier de Valk (Chapter 7), Gabriel Vigliensoni (Chapter 6), David M. Weigl (Chapter 13)

# 1 Introduction to MEI

Welcome to the MEI Guidelines. They provide documentation for the Music Encoding Initiative's framework for describing music notation documents. This includes both a technical specification of the XML-based implementation of MEI and an explanatory description of its concepts.

The MEI Guidelines are intended to serve as a reference tool for music encoders. Through the use of natural-language definitions and examples, this documentation assists users of MEI in achieving effective and consistent markup. Despite translating XML and RNG terminology and concepts into more accessible language, it is still a technical one that presupposes a minimal understanding of XML and music notation. Novice encoders may want to start their MEI experience by doing an [introductory tutorial](#) first. These Guidelines will provide recommendations and arguments for encoding different types of music notation for a variety of purposes. While the specification of the framework is complete, the description is not necessarily complete. MEI is used in various contexts, and not every use-case may be fully reflected in these Guidelines. However, MEI is a community effort, so feedback and suggestions for improvement are highly welcome. Several starting points to get in touch with the MEI community can be found on the [MEI website](#).

These Guidelines make use of real-world examples to illustrate appropriate encoding concepts. We consider the use of such images as fair use. Contributors to these Guidelines are requested to give proper reference to the libraries holding the material used here. They're also asked to be aware of potential copyright infringements and avoid respective material, or replace it with hand-drawn, made-up examples. If you find material that possibly offends copyright, please [get in touch](#) with us, and we will take it down.

## 1.1 About these Guidelines

### 1.1.1 MEI Design Principles

This section of the Guidelines defines principles and criteria for designing, developing, and maintaining an XML-based encoding scheme for music notation documents.

#### 1.1.1.1 Definitions and Parameters

A music notation document is one that contains music notation; that is, any one of a number of "visual analogues of musical sound, either as a record of sound heard or imagined, or as a set of visual instructions for performers." (Ian D. Bent, et al. "Notation." Grove Music Online. Oxford Music Online. 25 May 2010. <http://www.oxfordmusiconline.com/subscriber/article/grove/music/20114>.) However, MEI's understanding is more inclusive than this restrictive definition, i.e., Braille certainly qualifies as music notation documents.

The encoding scheme permits both the creation of new music notation documents and the conversion of existing ones from print and other electronic formats. However, conversion of existing documents may require revisions in content or rearrangement of information.

#### 1.1.1.2 General Principles

MEI may be used to encode both primary sources of music notation, such as an autograph or published score, and secondary sources, such as a scholarly edition based on one or more primary sources. The format encompasses both use cases, and the encoder must choose the elements and attributes most appropriate in each case. These Guidelines aim to provide guidance on that task.

As an encoded representation of one or more music notation documents, an MEI file may be employed as a surrogate for the original materials.

Although the encoding scheme does not define or prescribe intellectual content for music notation documents, it does define content designation and is intended to be used with available data content standards. MEI identifies the essential data elements within music notation documents and establishes codes and conventions necessary for capturing and distinguishing information within those elements for future action or manipulation. While there are a few elements that ought to appear in any MEI document, various intellectual, technical, and economic factors influence the level of detail of analysis and encoding actually undertaken. Taking this into consideration, the encoding scheme is designed with a minimum of required elements and allows for progressively more detailed levels of description as desired.

The encoding scheme preserves and enhances the current functionality of existing music notation documents. It permits identification of document structures and content that support description, navigation, analysis, and online and print presentation.

The encoding scheme is intended to facilitate interchange between notational tools. It aims to assist in the creation of more effective and consistent encoding, encourage the creation of cooperatively-created and widely available databases of music notation documents, and permit the reuse of encoded data for multiple output purposes. It will also ensure that machine-readable music notation documents will outlive changing hardware and software environments because they are based on a platform-independent standard.

### 1.1.1.3 Structural Features

The encoding scheme is based on eXtensible Markup Language (XML), a text-based format for representing structured information. It is expressed as a One Document Does-it-all (ODD) document. For more information on ODD, please refer to [1.2.5 Customizing MEI](#), existing notation encoding schemes, etc. have been consulted and employed as appropriate. For example, the data model includes a header that is comparable to the TEI header, and TEI and EAD naming conventions and tag structures have been used whenever feasible. However, while some feature names are similar, or even the same, it is important to recognize that MEI and TEI have different semantic scope. Obviously, a note element in MEI does not carry the same meaning as the element of the same name in TEI. Perhaps less obviously, a phrase in music notation is unrelated to a textual phrase.

With respect to metadata, MEI recognizes the close relationship between the metadata content found in the MEI header and that of catalog records, authority records, and finding aids. Therefore MEI provides ways of indicating in the encoding the corresponding fields of other metadata standards.

To ensure broad international and multi-repertoire application of MEI, existing musical terminology was used in building the data model where practical. When appropriate, a more neutral terminology was used to facilitate sharing of concepts and thus stressing the commonalities between different repertoires. Finally, extensive use of attributes and clearly-defined classification mechanisms in the schema permits the refinement of element meanings within specific musical, geographic, or temporal contexts.

### 1.1.1.4 Control and Maintenance

The Music Encoding Initiative Community has given itself [By-laws](#), which regulate all essential properties and procedures. The community elects a [Board](#), which in turn governs and represents the community. The Board consists of nine elected members, with three seats standing for election for three year terms each year. Everyone registered to the [MEI-L](#) mailing list is eligible to vote for the Board.

In addition to the Board, there is a [Technical Team](#), which is open for anyone interested to work on the maintenance and improvement of MEI itself. The Technical team will assist Interest Groups and other interested community members in an advisory capacity on how to further develop MEI for both existing and new fields of application.

## 1.1.2 Acknowledgments

Many institutions and individuals assisted in the preparation of these Guidelines and in the overall development of the Music Encoding Initiative framework and community.

Grateful acknowledgment is given to the following institutions for their generous contributions: the Akademie der Wissenschaften und der Literatur (AdW) in Mainz for serving as hosting institution for the MEI Community, and the National Endowment for the Humanities (NEH) and the Deutsche Forschungsgemeinschaft (DFG) for their joint financial support of the MEI project in its early stages. We thank several institutions that hosted Music Encoding Conferences or other MEI-related meetings in the past: The AdW Mainz, the University of Virginia Library, the Biblioteca Umanistica of the Università degli Studi Firenze, McGill University Montréal, the Centre d'études supérieures de la Renaissance Tours, the Maryland Institute for Technology in the Humanities (MITH) in College Park, the Oxford e-Research Centre, the Universität Paderborn and the Österreichische Akademie der Wissenschaften Wien in conjunction with the Universität Wien and the Mozarteum Salzburg. We also thank all other institutions that allow their researchers to invest time into both the community and the encoding framework. It is their interest that makes MEI an incredible platform for interchange and scholarly progress.

The Text Encoding Initiative is also owed a special debt of gratitude. In addition to providing much of the inspiration for MEI, the TEI organization supplied funding for the MEI Technical Group in its efforts to adopt ODD. The editors of these Guidelines are grateful for those of the TEI, which provided a stellar exemplar and from which we have borrowed shamelessly.

MEI has been a community-driven effort for more than a decade, and many individuals have provided significant and much-appreciated commitments of time and energy to the development of MEI: Nikolaos Beer; Vincent Besson; Benjamin W. Bohl; Margrethe Bue; Donald Byrd; Irmlind Capelle; Tim Crawford; David A. Day; Giuliano Di Bacco; Norbert Dubowy; Richard Freedman; Ichiro Fujinaga; Andrew Hankinson; Maja Hartwig; Kristin Herold; Franz Kelnreiter; Johannes Kepper; Robert Klugseder; Zoltán Kőmíves; David Lewis; Urs Liska; Elsa De Luca; Erin Mayhood; Stefan Morent; Stefan Münnich; Markus Neuwirth; Kevin Page; Daniel Pitti; Laurent Pugin; Klaus Rettinghaus; Kristina Richts; Daniel Röwenstrunk; Perry Roland; Craig Sapp; Agnes Seipelt; Eleanor Selfridge-Field; Christine Siegert; Peter Stadler; Axel Teich Geertinger; Martha Thomae; Joachim Veit; Raffaele Viglianti; Thomas Weber; and Sonia Wronkowska.

Thanks to Bernhard R. Appel; Richard Chesser; Morgan Cundiff; J. Stephen Downie; Oliver Huck; Fotis Jannidis; John Rink; Federica Riva; Frans Wiering and Barbara Wiermann for providing expertise on a wide range of topics related to music notation modelling.

Also thanks to Syd Bauman, Terry Catapano, and Sebastian Rahtz for their invaluable problem-solving assistance during the development of the 2010 RNG schema. Thanks to Sebastian Rahtz and James Cummings of the Text Encoding Initiative (TEI) for their help with making ODD work with MEI, their assistance in more closely aligning MEI and TEI, and their quick responses to questions and Roma bug reports.

Finally, the members of the Music Encoding Initiative would like to thank Perry Roland for his foresight, engagement and dedication in laying the foundations of this initiative.

## 1.2 Basic Concepts of MEI

This chapter is intended to explain basic concepts of MEI, like events vs. controlevents.

### 1.2.1 Musical Domains

The term "music" has many different notions, ranging from audible sounds over written performance instructions or transcriptions of such events to conceptual rulesets that establish different theories of what music is, and what is allowed in music. In 1965, Milton Babbitt distinguished between *graphemic*, *acoustic* and *auditory* aspects of music (Babbitt, Milton: *The Use of Computers in Musicological Research*, in: *Perspectives of New Music* 3/2 (1965), p. 76).

Various music encoding formats took up this distinction, most notably SMDL, the *Standard Music Description Language* (ISO/IEC DIS 10743). While the format itself was hardly ever used for its impractical implementation details, parts of its design certainly influenced the development of other formats, including MEI. In a documentation draft (<http://xml.coverpages.org/smdl10743-pdf.gz>, p.5), SMDL identifies four different *musical domains*:

**logical domain** The logical domain is the basic musical content – the essence from which all performances and editions of the work are derived, including virtual time values, nominal pitches, etc. The logical domain is describable as “the composer’s intentions with respect to pitches, rhythms, harmonies, dynamics, tempi, articulations, accents, etc.” and it is the primary focus of SMDL. It can also be described as “the abstract information common to both the gestural and visual domains.” [...]

**gestural domain** The gestural domain is comprised of any number of performances, each of which may specify how and when components of the logical domain is rendered in a specific performance, including all the means whereby the performer actually “expresses” (acoustically instantiates) the music (intonation, agogic and dynamic stress, etc.). The gestural domain is perhaps most succinctly described as “the information added by performers,” or “how the music actually sounds during particular performances.” [...]

**visual domain** The visual domain is comprised of any number of scores, each of which somehow specifies exactly how components of the logical domain is rendered visually in some particular printable (and/or displayable) edition, including such graphical details as symbology, symbol sets, fonts, page layout, beaming conventions and exceptions, etc. The visual domain is perhaps most succinctly described as “the information added by human editors, engravers, and typesetters,” or “how the music actually looks in some particular edition.” [...]

**analytical domain** The analytical domain is comprised of any number of theoretical analyses and/or commentaries, each of which somehow specifies opinions, exegeses, etc. about any or all of the information in the other three domains. [...]

On a generic level, MEI follows the same definition, and it definitely shares the same terminology. However, not all four domains are available throughout the MEI schema, and quite frequently, two domains fall together in MEI. Very often, *MEI prioritizes the visual domain over the gestural domain* by (partly) conflating the logical and the visual domains. For example, MEI utilizes the `pname` (pitch name) attribute on notes to capture the *written* pitch of a note, whereas the sounding pitch may be described with the `pname.ges` attribute. Here, the logical and visual domains go without a special indication, whereas the gestural domain is identified by a special suffix. However, in case of transposing instruments, additional markup (namely the attributes `trans.diat` and `trans.semi` from MEI's attribute class `att.staffDef.log`) will create a distinction between the logical and visual domain (see chapter [4.2.2 Defining Score Parameters for CMN](#)). In that case, `pname` will be restricted to the visual domain, while the logical aforementioned attributes provide additional information for the logical domain.

Even though the technical implementation of MEI prioritizes the visual domain to some degree, this does not mean that any given encoding has to provide visual information. MEI takes no assumption on what data is required: While an OMR project (*optical music recognition*) may generate strictly visually oriented data only, another project focussed on audio transcriptions may generate gestural data only. A third project could integrate both approaches.

In order to avoid ambiguous encodings, MEI is very strict and specific on the scope of its individual markup elements. For an encoder, the suffixes mentioned above provide clear hints on which domain is addressed by specific markup: Many attributes carry a suffixed `.log` (logical), `.ges` (gestural), `.vis` (visual), or `.anl` (analytical) in their name. In addition, the internal structure of MEI heavily relies on those different domains. When customizing MEI (see chapter [1.2.5 Customizing MEI](#)), it is possible to turn off either visual or gestural domain encoding completely. That way, MEI allows to address the four most eminent musical domains specifically and independent of each other.

## 1.2.2 Events and Controlevents

MEI differentiates between two essential aspects of music notation: *Events* and *ControlEvents*. There are other examples for such a separation of concerns with regard to music. In Greg's Copy-Text Theory (W.W. Greg: *The Rationale of Copy-Text*, 1950), a distinction between primary and secondary text is made; similar attempts have been made for music specifically.

In MEI, elements describing the basic musical text are referred to as *Events*. They are the building blocks for the stream of music – mostly those are `<note>`s, `<rest>`s, and `<chord>`s. In contrast, *ControlEvents* make no independent contribution to that flow of music. Instead, they provide additional information about the encoded *Events*, they *control* their performance. Examples for such *ControlEvents* are `<dynam>`ic markings, `<tempo>`s indications, or performance `<dir>`ectives. Depending on the encoding strategy used, `<slur>`s and `<tie>`s often also fall into this category (they may be encoded as attributes instead, in which case they become a property of the basic events). Simply put, *Events* describe **what** needs to be performed, and *ControlEvents* indicate **how** it needs to be performed. In ([4 Repertoire: Common Music Notation-based](#)) MEI, *Events* are nested inside a `<layer>` element, while *ControlEvents* are direct children of the first `<measure>` they apply to, following all `<staff>` elements there. These structural differences result in different markup concepts. As *Events* are encoded inside `<layer>`s, their *semantic position* inside the encoded work can be derived from their *structural position* – the measure, staff and layer they're nested in, and within that layer by their position inside the sequence of all layer children. As mentioned above, it is highly *recommended* to encode *ControlEvents* inside the first measure they apply to, but they still require references to the actual events they apply to. There are two common concepts to provide such

a connection, both of which offering specific benefits and drawbacks. A technically very stable connection between *ControlEvents* and *Events* can be established by using *pointers*. In this case, all events that need to be referenced need an `xml:id` attribute, which holds a globally unique identifier for this very element. The referencing controlevent then uses a `startid` and, if necessary, `endid` attribute to create a link to where in the stream of music it is supposed to start or end.

```
<measure n="10">
  <staff n="1">
    <layer>
      <note pname="f" oct="4" dur="4"/>
      <note pname="g" oct="4" dur="4" xml:id="c4ded06ff"/>
      <note pname="a" oct="4" dur="4"/>
      <note pname="c" oct="5" dur="4"/>
    </layer>
  </staff>
  <dynam startid="#c4ded06ff">f</dynam>
</measure>
```

Listing 1.

In the example above, the `<dynam>` element references the second quarter in the given measure. Additional attributes like `place` may be used to describe the position of the *forte* indication within the score. A `<hairpin>` element may use the `endid` attribute to indicate the duration of the hairpin using the same mechanism as above.

`startid (att.startId)` Holds a reference to the first element in a sequence of events to which the feature applies.

`endid (att.startEndId)` Indicates the final element in a sequence of events to which the feature applies.

A *ControlEvent* encoded like above will be strictly tied to the referenced *Events* – if their position inside the XML document changes for whatever reason, they will keep that connection. This means that the *semantic position* to which they are bound may change without affecting the binding. An example could be an inserted additional note in front – the dynamic marking would not start on the second quarter, but perhaps on the third instead.

As this behavior may not be desired in all cases, an alternative binding between *ControlEvents* and *Events* is possible, relying on *timestamps* instead. This mechanism is illustrated in the following example:

```
<measure n="10">
  <staff n="1">
    <layer n="1">
      <note pname="f" oct="4" dur="4"/>
      <note pname="g" oct="4" dur="4"/>
      <note pname="a" oct="4" dur="4"/>
      <note pname="c" oct="5" dur="4"/>
    </layer>
```

```
</staff>
<dynam staff="1" layer="1" tstamp="2">f</dynam>
</measure>
```

---

## Listing 2.

---

Here, no `xml:id` is required on notes. Instead, the `<dynam>` element uses the `staff` and `layer` attributes to indicate to which set of events the following `tstamp` attribute refers to.

`tstamp`                    Encodes the onset time in terms of musical time, i.e., `beats[.fractional beat part]`, as  
(`att.timestamp.log`)        expressed in the written time signature.

This mechanism actually depends on what has been only recommended above: placing the `controlevent` inside the measure where it starts. The `startid` reference mechanism would work equally well if all `controlevents` were positioned in the very first or last measure, or actually even inside a separate file. The `tstamp` references however would not, they depend on correct placement of the `controlevents` inside the XML tree. For consistency, it is therefore *recommended* to always use this placement.

The benefit of this concept is that `controlevents` are tied to a *semantic position*, but not necessarily to a given XML element. The `forte` may still be placed on the second quarter, even though the composer may have replaced that quarter G4 with a different pitch and / or duration. Actually, it is not required that an `Event` can be found at the position indicated by a timestamp. This may be useful to encode a slur ending at an arbitrary position between two events, or dynam markings spread across otherwise empty measures.

If the ending of a `Control/Event` shall be given by timestamp, the `tstamp2` attribute is used.

`tstamp2`                    Encodes the ending point of an event, i.e., a count of measures plus a beat location in  
(`att.timestamp2.log`)        the ending measure.

Because of potential inconsistencies, an encoding should not offer both `startid` and `tstamp` or `endid` and `tstamp2`. Though not being recommendable, it is possible to mix `startid` with `tstamp2` and `tstamp` with `endid`. In general, it is easier for software to process `startid` and `endid`. When no other arguments apply, using `xml:id`-based pointers is therefore the most common way to connect `ControlEvents` with `Events`.

The details on how timestamps are calculated and used in MEI are given in [1.2.3 Timestamps in MEI](#).

### 1.2.3 Timestamps in MEI

In MEI, timestamps are treated in a slightly simplified way: they have no notion of `beat`. Instead, timestamps rely solely on the numbers given in the meter signature. In a measure of 4/4, timestamps will range from 1 to 4. The second eighth note will be 1.5 in this case. If the same measure would be given in 2/2, it would be 1.25 instead.

`tstamp`                    Encodes the onset time in terms of musical time, i.e., `beats[.fractional beat part]`, as  
(`att.timestamp.log`)        expressed in the written time signature.

At this point, MEI uses real numbers only to express timestamps. In case of (nested or complex) tuples, this solution is inferior to fractions because of rounding errors. It is envisioned to introduce a fraction-based value for timestamps in a future revision of MEI. For now, it is recommended to round the fractional part of the number to no more than five digits to avoid such problems.

Durations may also be expressed based on timestamps. In this case, the values are a combination of the *count of measures* that need to be moved forward to reach the measure in which an encoded feature ends, and the *timestamp* within that measure.

**tstamp2**  
**(att.timestamp2.log)** Encodes the ending point of an event, i.e., a count of measures plus a beat location in the ending measure.

The following example contains a number of <slur> examples illustrating durations expressed by timestamps.

```
<!-- slur starting on timestamp 1, ending on timestamp 4 of the same measure -->
<slur tstamp="1" tstamp2="0m+4"/>
<!-- slur ending on timestamp 1 of the following measure -->
<slur tstamp="1" tstamp2="1m+1"/>
<!-- slur ending on timestamp 2.5 in the second next measure -->
<slur tstamp="1" tstamp2="2m+2.5"/>
```

### Listing 3.

Sometimes, timestamps are used to indicate positions where no music *Events* are located (see [1.2.2 Events and Controlevents](#)). Therefore, the allowed range of timestamps stretches from 0 to the current meter count + 1. By definition, a timestamp of 1 indicates the position of the left bar line, while a timestamp of 5 (in case of a 4/4 meter) indicates the right bar line. This makes it possible to encode open-ended slurs in a graphical way. However, it should be kept in mind that such timestamps may not be converted to startid and endid, and not every application may be able to render them correctly, even though they are perfectly valid MEI, and sometimes are necessary to faithfully transcribe a source.

## 1.2.4 MEI Profiles

MEI is an encoding framework, not a data format. This means that MEI provides recommendations for encoding music documents, but it depends on the encoder's needs and requirements to which features and solutions are appropriate to the task and should be used. MEI offers specific models for different notation types and music repertoires, but it is rarely advisable to use them all side by side in one encoding.

In order to use MEI, it is advised to use a restricted version of the schema, which will make it easier both for an encoder and a reader of the encoded files. MEI provides a number of pre-defined *profiles*, which focus on specific uses of MEI while still maintaining a great level of flexibility. For projects that need even better control over their data, it is highly recommended to create a more specific customized version of MEI (see chapter [1.2.5 Customizing MEI](#)). The following customizations are provided with every release of MEI:

- mei-CMN** For most users, this will be the best starting point into music encoding with MEI. The *mei-CMN* customization targets at documents that use *Common Western Music Notation*. The specific rules for that notation are specified in chapter 4 [Repertoire: Common Music Notation](#), even though other chapters of these Guidelines apply as well.
- mei-Mensural** For documents written in *Mensural Notation* (both black and white), MEI offers the *mei-Mensural* customization. The specific rules for that notation are specified in chapter 5 [Repertoire: Mensural Notation](#), even though other chapters of these Guidelines apply as well.
- mei-Neumes** This profile allows to encode medieval *Neume Notation* with MEI. The specific rules for that notation are specified in chapter 6 [Repertoire: Neume Notation](#), even though other chapters of these Guidelines apply as well. Please note that the *mei-Neumes* profile has undergone significant changes from MEI version 3 to version 4.
- mei-Basic** As an encoding framework, MEI offers multiple approaches to encode certain features at various levels of detail. While this flexibility is at the core of MEI and often required for research projects, it is an obstacle when developing software and converters for MEI. The *mei-Basic* profile is a subset of MEI which restricts it to one way of encoding for every feature of music notation. It covers *Common Western Music Notation* only, and excludes all editorial markup. In essence, it has the same functionality as most other music encoding formats like MusicXML or MNX. The purpose of *mei-Basic* is to serve as common ground for data interchange, both between projects using different profiles of MEI, and other encoding schemes.
- mei-all** This is the full definition of MEI. It includes all different repertoires, which has certain side effects and enables encoding options that are neither intended nor advocable. For example, in mensural notation music is organized by staves. In contrast, Common Music Notation utilizes measures, which in turn contain staves. These staves have a different meaning here, and are modeled differently in MEI. *mei-all* mixes those models and thus invites encoding errors. In general, you should almost never use *mei-all* except for testing purposes.
- mei-all\_anyStart** This profile includes all of *mei-all*, but extends it even further so that it allows any MEI element as root of conforming MEI instances. In regular MEI, the only allowed starting elements are *mei*, *meiHead*, *music* and *meiCorpus*. The sole purpose of this customization is to simplify validation at tutorial sessions and other educational purposes. It should not be used in production.

The first three profiles provide good starting points to encode music from the respective repertoires. They may also serve as template for further, project-specific customizations. The latter two profiles target very specific use cases and should not be used by default.

## 1.2.5 Customizing MEI

In production, it is best to use a customized version of MEI, restricted to the very needs of a project. Such a custom schema will guide the encoders and will help to ensure consistency and data quality throughout a project's files. A customization typically provides a subset of MEI's encoding models (typically starting from one of the official *profiles* mentioned in chapter [1.2.4 MEI Profiles](#)), with only one solution for any given situation being allowed. The customization will help to reflect the scope of a project into its data: Only those aspects of music notation a project is interested in will be allowed, so that the absence of a specific information can not be misunderstood as an oversight of the encoders. Larger editorial projects like *Complete Works* editions typically use *Editorial Guidelines* (german: *Editionsrichtlinien*) for the same purposes: (internal) quality control and (external) documentation. In that sense, MEI customizations may serve as Editorial Guidelines in digital form.

MEI is implemented in ODD. ODD, or *One Document Does-it-all*, is another XML-based markup language developed and maintained by the TEI. TEI's documentation for ODD can be found in the TEI Guidelines chapter 22: [Documentation Elements](#), chapter 23: [Using the TEI](#), and the "Getting Started with P5 ODDs" document.

At this point, there is no specific documentation on how to customize MEI with ODD beyond the generic TEI documentation. However, the provided [1.2.4 MEI Profiles](#) are based on ODD customizations, and may serve as starting point for further project-specific restrictions. They can be found at <https://github.com/music-encoding/music-encoding/tree/develop/customizations>. In addition, several projects have shared their customizations on GitHub, such as [Freischütz Digital](#) or [Beethovens Werkstatt](#).

MEI provides a web service at <http://custom.music-encoding.org> which allows to compile such customizations against the MEI sources in order to generate RelaxNG schemata, which can be used for validation. More documentation on customizing MEI will be provided as time permits; until then, it is recommended to [reach out to the MEI Community](#) for additional assistance.

## 1.3 Sample Encodings and Tools for MEI

The Music Encoding Initiative provides a collection of sample encodings, which demonstrate a wide-range of uses of MEI in real-world contexts. They are available from <https://github.com/music-encoding/sample-encodings>.

For MEI, there is also a number of tools, which facilitate encoding of and working with MEI instances in various contexts. These tools are available from the <https://music-encoding.org/resources/tools.html> website.

## 2 Shared Concepts in MEI

This chapter describes basic principles and shared concepts of MEI. Besides giving a general understanding of the basic structures of an MEI file it tries to introduce elements, models, and attributes that are part of the MEI.shared module, describe their use or at least point to chapters of these guidelines or tutorials that describe their use and application.

### 2.1 Structural Elements

Besides elements used by multiple other modules the MEI.shared module defines the main structural elements of an MEI file. Please be aware that there is also a [A short tutorial about the basics of XML & MEI](#) that helps understanding and learning the contents of this chapter.

#### 2.1.1 Document Root Elements

MEI defines four elements qualifying as root elements (i.e., the element containing everything else) of an MEI document; the most common of these are defined in the MEI.shared module:

**<mei>** Contains a single MEI-conformant document, consisting of an MEI header and a musical text, either in isolation or as part of an meiCorpus element.

The most straightforward – and probably the most common choice fitting most of the use cases when encoding music – is the **<mei>** element. It contains an **<meiHead>** element for capturing metadata and a **<music>** element for describing the musical text. A more detailed description of the application of **<music>** can be found in the course of this section (see [2.1.2 General Music Structure Elements](#)). If you want to learn more about the use of the **<meiHead>** element – formally declared in the MEI.header module – please visit the chapter [3.2 Structure of the MEI Header](#) in the [3 Metadata in MEI](#) section.

The below example shows the basic structure of an MEI file with **<mei>** as root element. Please be aware that this example still does not represent a valid MEI file:

```
<mei>
  <meiHead>
    <!-- metadata goes here -->
  </meiHead>
  <music>
    <!-- description of musical text goes here -->
  </music>
</mei>
```

Listing 4.

The other potential root elements serve different use cases or purposes.

**<music>** Contains a single musical text of any kind, whether unitary or composite, for example, an etude, opera, song cycle, symphony, or anthology of piano solos.

A document with `<music>` as root element provides music notation markup without metadata, and could serve embedding MEI within other kinds of markup, e.g., TEI (see [14.1 TEI](#)).

The below example shows the basic structure of an MEI file with `<music>` as root element. Basically this already represents a valid MEI file, although without any contents:

---

```
<music>
  <!-- description of musical text goes here -->
</music>
```

Listing 5.

---

**<meiCorpus>** A group of related MEI documents, consisting of a header for the group, and one or more `<mei>` elements, each with its own complete header.

`<meiCorpus>` contains an `<meiHead>` element describing a collection of related MEI-encoded texts – known as a corpus – and an `<mei>` element for each text. Further information regarding the organization and encoding of music corpora is given in chapter [3.8.5 Musical Corpora](#).

The below example shows the basic structure of an MEI file with `<meiCorpus>` as root element. Please be aware that this example still does not represent a valid MEI file:

---

```
<meiCorpus>
  <meiHead>
    <!-- metadata on the corpus goes here -->
  </meiHead>
  <mei>
    <meiHead>
      <!-- metadata on first text goes here -->
    </meiHead>
    <music>
      <!-- description of first musical text goes here -->
    </music>
  </mei>
  <mei>
    <meiHead>
      <!-- metadata on second text goes here -->
    </meiHead>
    <music>
      <!-- description of second musical text goes here -->
    </music>
  </mei>
  <mei>
    <meiHead>
      <!-- metadata on ... text goes here -->
    </meiHead>
```

```
</meiHead>
<music>
    <!-- description of ... musical text goes here -->
</music>
</mei>
</meiCorpus>
```

Listing 6.

**<meiHead>** Supplies the descriptive and declarative metadata prefixed to every MEI-conformant text.

The **<meiHead>** element, formally declared in the MEI.header module, is described in chapter [3.2 Structure of the MEI Header](#). A document with **<meiHead>** as root element only contains metadata and is also known as an independent or stand-alone header. Stand-alone headers are more fully described in chapter [3.8.1 Independent Headers](#).

The below example shows the basic structure of an MEI file with **<meiHead>** as root element. Please be aware that this example still does not represent a valid MEI file:

```
<meiHead>
    <!-- metadata goes here -->
</meiHead>
```

Listing 7.

The above examples all carry two attributes on their root elements. While the @xmlns is a general feature of XML and not defined in MEI it is crucial for stating the fact that it is an MEI file you are dealing with. The second attribute is [att.meiVersion](#).

meiversion ([att.meiVersion](#)) Specifies a generic MEI version label.

Although not required the [att.meiVersion](#) attribute is important for defining a stable reference to a specific MEI-version used in the enclosed encoding, and thus is highly recommended on your root element.

## 2.1.2 General Music Structure Elements

**<music>** Contains a single musical text of any kind, whether unitary or composite, for example, an etude, opera, song cycle, symphony, or anthology of piano solos.

As indicated above, the general place for encoding the musical text is the **<music>** element. MEI.shared offers two possible child elements:

**<body>** Contains the whole of a single musical text, excluding any front or back matter.

**<group>** Contains a composite musical text, grouping together a sequence of distinct musical texts (or groups of such musical texts) which are regarded as a unit for some purpose, for example, the collected works of a composer.

While **<body>** holds the contents of a single musical text, **<group>** allows the textual body to consist of a series of (subordinate) musical texts or other e.g., to represent a collection of independent musical texts which is to be regarded as a single unit for processing or other purposes. It is provided to simplify the encoding of collections, anthologies, and cyclic works. It can also be used to record the potentially complex internal structure of corpora, covered more fully in chapter [3.8.5 Musical Corpora](#). Whether the musical text being encoded should be structured one way or the other is not to be decided here. For example, a collection of songs might be regarded as a single item in some circumstances, or as a number of distinct items in others. In such borderline cases, the encoder must choose whether to treat the text as unitary or composite; each option may have advantages and disadvantages.

There are several more possible child elements of the **<music>** element defined in other modules of MEI, such as **<front>** and **<back>** elements (defined in MEI.text module, cf. [9.2 Text in MEI](#)), **<performance>** (defined in MEI.performance module, cf. [12.2 Performances](#)), **<genDesc>** (defined in MEI.genetic module, cf. [11.3 Genetic Markup](#)), **<facsimile>** (defined in MEI.facsimile module, cf. [12.1 Facsimiles](#)).

Please be aware that the following examples still do not reflect valid MEI files as they are missing some required elements not defined in the MEI.shared module.

The basic structure of a unitary musical text:

---

```
<mei>
  <meiHead>
    <!-- metadata goes here -->
  </meiHead>
  <music>
    <front>
      <!-- front matter of text, if any, goes here -->
    </front>
    <body>
      <!-- body of text goes here -->
    </body>
    <back>
      <!-- back matter of text, if any, goes here -->
    </back>
  </music>
</mei>
```

Listing 8.

---

Examples of composite texts which may be represented using the `<group>` element include anthologies and other collections. The presence of common front matter referring to the whole collection, possibly in addition to front matter relating to each individual musical text, is a good indication that a given musical text might usefully be encoded in this way.

For example, the overall structure of a collection of songs might be encoded as follows:

```
<music>
<group>
  <music>
    <!-- song 1 -->
  </music>
  <music>
    <!-- song 2 -->
  </music>
  <!-- additional songs here -->
</group>
</music>
```

Listing 9.

A group of musical texts may contain other unitary and grouped texts:

```
<music>
<group>
  <music>
    <!-- song 1 -->
  </music>
  <group>
    <!-- songs sharing one or more characteristics, treated as a group -->
    <music>
      <!-- song 2 -->
    </music>
    <music>
      <!-- song 3 -->
    </music>
  </group>
</group>
</music>
```

Listing 10.

The `<group>` element may be used to encode any kind of collection in which the constituents are regarded by the encoder as works in their own right, such as *ad hoc* single- or multiple-composer collections or anthologies of works not originally conceived of as a single composition.

### 2.1.2.1 Divisions of the Body

This section describes sub-division of the `<body>` of a musical text. Front and back matter are described in chapter [9.2 Text in MEI](#).

**<mdiv>** Contains a subdivision of the body of a musical text.

**type** Designation which characterizes the element in some sense, using any convenient classification  
**(att.typed)** scheme or typology that employs single-token labels.

**class** Contains one or more URIs which denote classification terms that apply to the entity bearing this  
**(att.classed)** attribute.

The body of a unitary musical text may contain one or more discrete, linear segments. The names commonly used for these structural subdivisions vary with the genre, style, and time period of the music, or even at the whim of the author, editor, or publisher. For example, a major subdivision of a symphony is generally referred to as a 'movement'. An opera, on the other hand, is usually organized into 'acts' and then further by 'scenes'. All such divisions are treated as occurrences of the same neutrally-named `<mdiv>` element. The attributes type or class may be used to categorize them independently of their hierachic level.

To accommodate "divisions within divisions", an `<mdiv>` element may contain additional `<mdiv>` sub-elements nested to any level required. For example, the encoding of a multi-movement work, such as a symphony, might have the following structure:

---

```
<body>
  <mdiv type="symphony">
    <mdiv n="1" type="movement">
      <!-- contents of mvt 1 -->
    </mdiv>
    <mdiv n="2" type="movement">
      <!-- contents of mvt 2 -->
    </mdiv>
    <mdiv n="3" type="movement">
      <!-- contents of mvt 3 -->
    </mdiv>
    <mdiv n="4" type="movement">
      <!-- contents of mvt 4 -->
    </mdiv>
  </mdiv>
</body>
```

---

Listing 11.

While dramatic works, such as Verdi's opera, *Il Trovatore*, often exhibit a more deeply-nested structure:

```
<body>
  <mdiv type="opera">
    <mdiv n="I" type="act">
      <mdiv n="1" type="scene">
        <!-- contents of act I, sc. 1 -->
      </mdiv>
      <mdiv n="2" type="scene">
        <!-- contents of act I, sc. 2-->
      </mdiv>
      <mdiv n="3" type="scene">

    </mdiv>
  </mdiv>
</body>
```

```
</mdiv>
</mdiv>
</mdiv>
</body>
```

Listing 12.

Conventionally, in performance the musical structures represented by `<mdiv>` elements are separated by pauses; however, *attacca*, *attacca subito*, *seque*, or similar terms are sometimes used at the end of an `<mdiv>` to indicate that the next `<mdiv>` should begin immediately after the conclusion of the current one. These terms have no effect, however, on the logical segmentation of musical content using `<mdiv>` elements.

### 2.1.2.2 Content of Musical Divisions

The contents of `<mdiv>` can be organized according to the two encoding paradigms provided by the `<score>` and `<parts>` elements.

**<score>** Full score view of the musical content.

**<parts>** Provides a container for performers' parts.

The `<score>` element represents notation in which all the parts of an ensemble are arranged on vertically aligned staves, while the `<parts>` element collects the individually notated parts for each performer or group of performers. The explicit encoding of these two 'views' is necessary because it is not always possible or desirable to automatically derive one view from the other. In addition, separating scores and parts can eliminate a great deal of markup complexity.

```
<body>
<mdiv n="1" type="movement">
  <score>
    <!-- markup of score goes here -->
  </score>
  <parts>
    <!-- markup of performers' parts goes here -->
  </parts>
</mdiv>
<!-- additional movements go here -->
</body>
```

Listing 13.

The `<score>` and `<parts>` elements may also be employed to accommodate different methods of organizing the markup – with no particular presentation implied. In this case, software may render a collection of parts as a score or a score as a collection of parts.

Within the collective `<parts>` element, notation for a single performer is represented by the `<part>` element:

**<part>** An alternative visual rendition of the score from the point of view of a particular performer (or group of performers).

A `<part>` is effectively a small-scale score, allowing all the encoding features of a full score, such as multiple staves, performance directives, and so on. A group of `<part>` elements is useful for encoding performing parts when there is no score, such as in early music part books; when the parts have non-aligning bar lines; when different layout features, such as page turns, are needed for the score and parts; or for accommodating software that requires part-by-part encoding.

Please note that `<part>` elements in MEI are not an indication of voice leading or staff grouping. Voice leading can be encoded using the `next` attribute, available on all the members of the `model.eventLike` class. The `<staffGrp>` element handles grouping of staves in the score context.

```
<parts>
  <part label="Violin 1">
    <!-- first performer's part -->
  </part>
  <part label="Violin 2">
    <!-- second performer's part -->
  </part>
  <!-- additional performers' parts -->
</parts>
```

Listing 14.

In both score and part views, the `<scoreDef>` element is used to describe logical characteristics of the encoded music, such as key signature, the sounding key (as opposed to the notated key signature), meter, etc., and visual features, such as page size, staff groupings and display labels, etc. The `<staffGrp>` elements within `<scoreDef>` and the order of `<staffDef>` elements inside `<staffGrp>` should follow the score order of the source for the encoding.

A `<part>` or `<score>` may be further divided into linear segments called "sections".

**<section>** Segment of music data.

`<section>` elements are often used as a scoping mechanism for clef signs, key and meter signatures, as well as metronome, tempo, and expression markings. Using `<section>` elements can help to minimize the need for backward scanning to establish context when the starting point for access is not at the beginning of the score. `<section>` elements may also be used for other user-defined, i.e., analytical or editorial, purposes and may therefore be arbitrarily nested to any desired level.

The `<ending>` element shares the same model as the `<section>` element. Unlike `<section>`, however, it may not be recursively nested.

**<ending>** Alternative ending for a repeated passage of music; i.e., prima volta, seconda volta, etc.

The most common (non-analytical, non-editorial) use of **<section>** and **<ending>** elements is illustrated below:

```
<music>
  <body>
    <mdiv>
      <score>
        <section>
          <!-- section one to be repeated -->
        </section>
        <ending n="1">
          <!-- 1st ending -->
        </ending>
        <ending n="2">
          <!-- 2nd ending -->
        </ending>
        <section>
          <!-- next section -->
        </section>
      </score>
    </mdiv>
  </body>
</music>
```

Listing 15.

---

Within **<section>** elements, several methods of organization are possible, depending upon the notational style of the source material and the encoder's needs. For example, when the MEI.cmn module is used, the default organization is measure-by-measure, with **<staff>** and **<layer>** sub-elements within each **<measure>**. Further discussion of CMN notation is continued in chapter [4 Repertoire: Common Music Notation](#).

However, staff-by-staff organization is more appropriate for music without measures and is provided when either the MEI.mensural or MEI.neumes module is employed. Coverage of mensural notation is provided in chapter [5 Repertoire: Mensural Notation](#), while [6 Repertoire: Neume Notation](#) describes neumatic notation.

It must be noted that, when both the MEI.cmn and MEI.mensural modules are available, it is possible to encode CMN notation without using **<measure>** elements; that is, staff-by-staff organization may be used and the ends of measures marked using **<barLine>** elements.

In certain circumstances, this approach may be preferable for reproduction of the visual layout of the music. However, the simultaneous use of the **<measure>** and **<barLine>** elements may lead to confusion and should be avoided.

Typically, MEI follows the order of sections as they appear in the document being encoded. When performance requires a different order, for instance in the case of D.C. and D.S. directives, the following element may be used to define the performance order.

**<expansion>** Indicates how a section may be programmatically expanded into its 'through-composed' form.

In the following example, **<expansion>** is used to indicate how the notated sections should be ordered in a "through-composed" rendition, for example for machine performance or analysis. The plist attribute contains an ordered list of identifiers of descendant **<section>**, **<ending>**, **<clem>**, or **<rdg>** elements. The sequence of values in the plist attribute indicates that the section labelled 'A' comes first, then the section labelled 'B', followed by the 'A' section again. This mechanism must be specified independently of any textual directives, such as "Da capo" or "D.S. al Fine", that may be present in the document.

```

<music>
  <body>
    <mdiv>
      <score>
        <section>
          <expansion plist="#shared.A #shared.B #shared.A"/>
          <section xml:id="shared.A">
            <!-- "A" section -->
          </section>
          <section xml:id="shared.B">
            <!-- "B" section -->
          </section>
        </section>
      </score>
    </mdiv>
  </body>
</music>

```

Listing 16.

### 2.1.3 Document Layout Elements

This section introduces the elements that can be used to represent document layout features in MEI, be it for the sake of capturing an original source's layout when transcribing or setting up layout features in so called 'born digital' documents.

**<pb>** An empty formatting element that forces text to begin on a new page.

n Provides a number-like designation that indicates an element's position in a sequence of (att.nNumberLike) similar elements. May not contain space characters.

The **<pb>** element can be used to mark page beginnings. When transcribing an existing document the n attribute should be used to record the page number displayed in the source. It need not be an integer, e.g., 'iv', or 'p17-3'. The logical page number can be calculated by counting previous **<pb>** ancestor elements. When used in a score context, a page beginning implies an accompanying system beginning. This element is modelled on an element in the Text Encoding Initiative (TEI) standard.

**<pgDesc>** Contains a brief prose description of the appearance or description of the content of a physical page.

Additional information can be provided on page beginnings. Ranging from a prose description of the page layout in **<pgDesc>** to defined headers and footers.

**<pgHead>** A running header.

**<pgFoot>** A running footer.

Columned layout can be captured with the following elements:

**<cb>** An empty formatting element that forces text to begin in a new column.

n (**<cb>**) Records the column number.

**<colLayout>** An empty formatting element that signals the start of columnar layout.

In order to force a system break in the musical text **<sb>** can be used.

**<sb>** An empty formatting element that forces musical notation to begin on a new line.

Critical editions and collections of works often contain extensive text, such as a title page, table of contents, an introductory essay, commentary, biographical sketch, index, etc. These textual items may appear in either the **<front>** or **<back>** elements. The front and back elements, available only when the MEI.text module is activated, are described more fully in chapter 9.2 Text in MEI.

**<front>** Bundles prefatory text found before the start of the musical text.

**<back>** Contains any appendixes, advertisements, indexes, etc. following the main body of a musical text.

## 2.1.4 General Text Structure Elements

The MEI.shared module provides basic text structure elements.

**<div>** Major structural division of text, such as a preface, chapter or section.

**<head>** Contains any heading, for example, the title of a section of text, or the heading of a list.

**<lg>** May be used for any section of text that is organized as a group of lines; however, it is most often used for a group of verse lines functioning as a formal unit, e.g., a stanza, refrain, verse paragraph, etc.

**<lb>** An empty formatting element that forces text to begin on a new line.

**<p>** One or more text phrases that form a logical prose passage.

A detailed description of their use and of other elements from the MEI.text module can be found in the corresponding chapter 9.2 Text in MEI.

## 2.2 General Music Elements

This section lists the elements defined in the shared module that are available within the music element.

### 2.2.1 Score and Parts

The following elements are provided for the capture of scores and parts:

**<score>** Full score view of the musical content.

**<parts>** Provides a container for performers' parts.

**<part>** An alternative visual rendition of the score from the point of view of a particular performer (or group of performers).

**<scoreDef>** Container for score meta-information.

**<staffDef>** Container for staff meta-information.

**<layerDef>** Container for layer meta-information.

**<staffGrp>** A group of bracketed or braced staves.

**<grpSym>** A brace or bracket used to group two or more staves of a score or part.

**<label>** A container for document text that identifies the feature to which it is attached. For a "tool tip" or other generated label, use the label attribute.

**<clef>** Indication of the exact location of a particular note on the staff and, therefore, the other notes as well.

**<clefGrp>** A set of simultaneously-occurring clefs.

**<keySig>** Written key signature.

**<keyAccid>** Accidental in a key signature.

The character of elements specifying one or more score or staff parameters, such as meter and key signature, clefs, etc., is that of a milestone; that is, they affect all subsequent material until a following redefinition. A **<score-Def>** element, which may affect more than just one staff, is allowed only within **<score>**, **<part>** and **<section>** elements, whereas **<staffDef>** is allowed only within **<staffGrp>**, **<staff>** and **<layer>**. A **<staffDef>** nested inside a **<staff>** must bear the same value for its n attribute as its parent staff and may thus not affect other staves.

The actual use of these elements depends on the repertoire and historical context of the source material. For details on their use in Common Western Notation, please refer to chapter [4.2.2 Defining Score Parameters for CMN](#).

### 2.2.2 Staves and Layers

The elements below are used to capture the logical organization of musical notation:

**<staff>** A group of equidistant horizontal lines on which notes are placed in order to represent pitch or a grouping element for individual 'strands' of notes, rests, etc. that may or may not actually be rendered on staff lines; that is, both diastematic and non-diastematic signs.

**<layer>** An independent stream of events on a staff.

The actual use of the [<staff>](#) and [<layer>](#) elements depends on the repertoire and historical context of the source material. For details on their use in Common Western Notation, please refer to chapter [4 Repertoire: Common Music Notation](#). For mensural notation, see chapter [5 Repertoire: Mensural Notation](#), and for neumatic notation, chapter [6 Repertoire: Neume Notation](#).

## 2.2.3 Basic Music Events

The basic features of music notation are represented by the following elements:

**<note>** A single pitched event.

**<chord>** A simultaneous sounding of two or more notes in the same layer \*with the same duration\*.

**<rest>** A non-sounding event found in the source being transcribed.

The characteristics of stems on notes and chords are indicated by means of attributes found in the [att.stems](#) class.

stem.dir ( <a href="#">att.stems</a> )	Describes the direction of a stem.
stem.len ( <a href="#">att.stems</a> )	Encodes the stem length.
stem.mod ( <a href="#">att.stems</a> )	Encodes any stem "modifiers"; that is, symbols rendered on the stem, such as tremolo or Sprechstimme indicators.
stem.pos ( <a href="#">att.stems</a> )	Records the position of the stem in relation to the note head(s).
stem.x ( <a href="#">att.stems</a> )	Records the output x coordinate of the stem's attachment point.
stem.y ( <a href="#">att.stems</a> )	Records the output y coordinate of the stem's attachment point.

## 2.2.4 Other events

Because they can occur in the context of a stream of events on the staff, some elements which are used in other contexts are also treated as events. For example, in addition to being used to define the initial clef of a staff, the [<clef>](#) element can also be used to indicate a clef change.

### 2.2.4.1 Key Signatures and Clefs

Key signatures and clefs as well as intra-staff changes to these musical parameters are treated as events.

**<keySig>** Written key signature.

**<keyAccid>** Accidental in a key signature.

**<clef>** Indication of the exact location of a particular note on the staff and, therefore, the other notes as well.

**<clefGrp>** A set of simultaneously-occurring clefs.

### 2.2.4.2 Bar Lines and Custos Signs

Measure separators, i.e., bar lines, and custos signs are also considered to be events.

**<barLine>** Vertical line drawn through one or more staves that divides musical notation into metrical units.

**<custos>** Symbol placed at the end of a line of music to indicate the first note of the next line. Sometimes called a "direct".

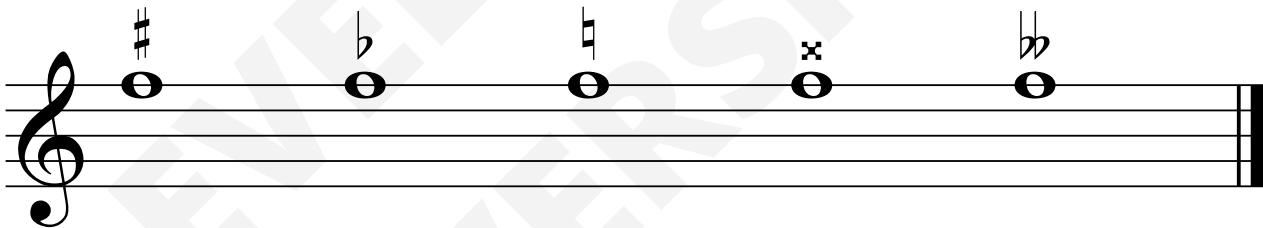

### 2.2.4.3 Accidentals, Articulation Symbols, Augmentation Dots, and Custos Signs

The following elements are regarded as events primarily because they sometimes occur independently of any associated notes, rests, or chords, especially in mensural and neume repertoires.

**<accid>** Records a temporary alteration to the pitch of a note.

**<artic>** An indication of how to play a note or chord.

**<dot>** Dot of augmentation or division.

```

<layer n="1">
  <note dur="1" oct="5" pname="f">
    <accid accid="s" func="edit"/>
  </note>
  <note dur="1" oct="5" pname="f">
    <accid accid="f" func="edit"/>
  </note>
  <note dur="1" oct="5" pname="f">
    <accid accid="n" func="edit"/>
  </note>

```

```
<note dur="1" oct="5" pname="f">
  <accid accid="x" func="edit"/>
</note>
<note dur="1" oct="5" pname="f">
  <accid accid="ff" func="edit"/>
</note>
</layer>
```

Listing 17.

#### 2.2.4.4 Lyric Syllables

The `<syl>` element is used to mark a word or portion of a word that is to be vocally performed. A fuller description of its use is provided in chapter [8.2 Lyric Syllables](#).

**<syl>** Individual lyric syllable.

#### 2.2.4.5 Event Spacing

The following elements provide control over the horizontal spacing of notational events, such as notes, chords, rests, etc.:

**<space>** A placeholder used to fill an incomplete measure, layer, etc. most often so that the combined duration of the events equals the number of beats in the measure.

In this context, the term ‘space’ is used to mean whitespace that is required to meaningfully align multiple voices in a multi-voice texture. In DARMS these were referred to as ‘push codes’. The `<space>` element is most often used when a new voice appears on a staff mid-measure.

The `<space>` element may also be used to align material that crosses staves.

‘Space’ can be thought of as another kind of event. In fact, some refer to this concept as an ‘invisible rest’.

While ‘space’ is meaningful, ‘padding’ is non-essential whitespace that is used to shift the position of the events which follow.

**<pad>** An indication of extra visual space between notational elements.

The `<pad>` element is provided in order to capture software-dependent placement information when it is desirable to do so. Unless the MEI file will be used as an intermediate file format, this is usually not necessary.

#### 2.2.5 Expression Marks

Expression marks are instructions in the form of words, abbreviations, or symbols that convey aspects of performance that cannot be expressed purely through the musical notation.

### 2.2.5.1 Text Directives

All of the following elements can be considered text directives; however, MEI uses the `<dir>` element specifically for words, abbreviations, numbers, or symbols specifying or suggesting the manner of performance that are not encoded elsewhere using the more specific elements of `<tempo>` and `<dynam>`.

**<dir>** An instruction expressed as a combination of text and symbols, typically above, below, or between staves, but not on the staff — that is not encoded elsewhere in more specific elements, like `<tempo>`, `<dynam>` or `<repeatMark>`.

Examples of directives include text strings such as 'affettuoso', fingering numbers, or music symbols such as segno and coda symbols or fermatas over a bar line. Directives can be control elements. That is, they can be linked via their attributes to other events. The starting point of the directive may be indicated by either a `tstamp`, `tstamp.ges`, `tstamp.real` or `startid` attribute, while the ending point may be recorded by either a `tstamp2`, `dur`, `dur.ges` or `endid` attribute. It is a semantic error not to specify a starting point attribute.

### 2.2.5.2 Tempo

Tempo marks are indications through words, abbreviations, or specific metronome settings of the speed at which a piece of music is to be performed. Both instantaneous and continuous tempo markings may be encoded using this element.

**<tempo>** Text and symbols descriptive of tempo, mood, or style, e.g., "allarg.", "a tempo", "cantabile", "Moderato", " $\text{J}=60$ ", "Moderato  $\text{J}=60$ ").

# Andante con moto

```

Listing 18.

### 2.2.5.3 Dynamics

Dynamics, or dynamic marks, are terms, abbreviations, and symbols that indicate the specific degrees of volume of a note, phrase, or section of music, e.g., "piano", "forte". Transitions from one volume level to another, e.g., "crescendo", "diminuendo", are also specified through dynamic marks.

**<dynam>** Indication of the volume of a note, phrase, or section of music.

### 2.2.5.4 Phrase Marks

Phrase marks are curved lines placed over or under notes to delineate short sections of a work that represent a unified melodic idea, analogous to a phrase in literature.

**<phrase>** Indication of 1) a "unified melodic idea" or 2) performance technique.

**<slur>** Indication of 1) a "unified melodic idea" or 2) performance technique.

MEI maintains a distinction between phrase marks and slurs, the latter being curved lines over or under a sequence of notes indicating they are to be performed using a particular playing/singing technique, notes that should be taken in a single breath by wind instruments or played by string instruments using a single stroke of the bow. Often, a slur also indicates that the affected notes should be played in a *legato* manner.

Even so, it is common for both of these concepts to be referred to generically as "slurs". Therefore, unless one is encoding music from a repertoire in which this distinction is important, the **<slur>** element should be preferred over **<phrase>**.

### 2.2.5.5 Ornaments

Ornaments are formulae of embellishment that can be realized by adding supplementary notes to one or more notes of the melody.

**<ornam>** An element indicating an ornament that is not a mordent, turn, or trill.

MEI provides a generic element for encoding an ornament symbol that is not a mordent, turn, or trill. For those common CMN ornaments, please refer to [4.4 Common Music Notation Ornaments](#).

Ornaments can be represented as textual strings (e.g., with a Unicode symbol) or with a user defined symbol (for the latter also see [2.4 User-defined Symbols](#)).

Ornaments may also be encoded as so called control events (see also: [1.2.2 Events and Controlevents](#)). That is, they can be linked via their attributes to other events. It is a semantic error not to specify a starting point attribute with either `tstamp` or `startid`.

## 2.3 Common Attributes

The following attributes, all of which are defined in separate attribute classes but are also provided through the `att.common` attribute class, are available on nearly all elements in an MEI encoding. They provide e.g., the means to identify, label, or reference elements in MEI-encoded files.

### 2.3.1 Attributes from the XML-namespace

The most general attributes that are very frequently encountered in MEI files are not even native MEI attributes but are coming from the basic definition of XML in the XML-namespace <http://www.w3.org/XML/1998/namespace>. MEI redefines some of them in the `att.basic` class.

- `xml:id` Regularizes the naming of an element and thus facilitates building links between it and other resources.
- (`att.id`) Each id attribute within a document must have a unique value.

The value of the `xml:id` attribute serves as an identifier for an element and its content. Its value must be unique in the context of the current document and must conform to the definition of an XML Name provided by the W3C Recommendation at <http://www.w3.org/TR/xml/#NT-Name>. Suggestions for constructing an `xml:id` value can be found at <http://www.w3.org/TR/xml/#sec-suggested-names>.

The `xml:id` attribute may take values similar to the following:

```
<!-- The following are all valid IDs. -->
<note xml:id="n1"/>
<note xml:id="_n1"/>
<note xml:id="thisIsMyFavoriteNote"/>
<note xml:id="shared.thisIsMyFavoriteNote"/>
```

Listing 19.

This is an example of an incorrectly-formulated `xml:id` value:

```
<!-- xml:id not valid as IDs are not allowed to start with a number. -->
<note xml:id="1"/>
```

Listing 20.

- `xml:base` Provides a base URI reference with which applications can resolve relative URI references into absolute URI references.
- (`att.basic`)

At many locations in an MEI file one can reference internal or external references. E.g. the following example defines a graphic and references an external image (entity) by means of the `target` attribute:

```
<graphic target="myImage.jpg"/>
```

---

#### Listing 21.

When a reference to an external entity is not a complete URI it is resolved against the current base URI; if not defined by other means this would be the location of the current document. The above example consequently would mean, that the file `myImage.jpg` referenced from `<graphic>` resides at the same location (in the same folder) as the MEI-file.

The `xml:base` attribute may be used "to specify a base URI other than the base URI of the document or external entity." (Marsch, Jonathan; Tobin, Richard: XML Base (Second Edition). W3C Recommendation 28 January 2009. online at: <http://www.w3.org/TR/2009/REC-xmlbase-20090128/>).

---

```
<graphic target="myImage.jpg" xml:base="http://www.mySite.org/images/" />
```

---

#### Listing 22.

The value of `xml:base` can be inherited from an ancestor. This is relevant for resolving relative links or URIs within the document. A comprehensible use case can be illustrated by the following example: the values of the `graphic` elements' `target` attribute can be completed by the `xml:base` value specified for the ancestor `<facsimile>` element:

```
<facsimile xml:base="http://www.mySite.org/images/">
  <surface>
    <graphic target="myImage.jpg"/>
    <graphic target="myImage.tif"/>
  </surface>
</facsimile>
```

---

#### Listing 23.

In order to determine an absolute URI, the base URIs of the element and all its ancestors (including the document node) have to be taken into account. In the above case the relative URIs of `graphic/@target` would consequently resolve to:

``` http://www.mySite.org/images/myImage.jpg http://www.mySite.org/images/myImage.tif ```

For more information on `xml:base` see: <https://www.w3.org/TR/xmlbase/>

The `xml:id` and `xml:base` attributes are especially important when it comes to linking document fragments to each other or to external entities. Many of the linking attributes are globally available in MEI through the [att.common](#) attribute class.

Yet there are other attributes from the XML-Namespace encountered in MEI files.

`xml:lang` Identifies the language of the element's content. The values for this attribute are language 'tags' as defined in BCP 47. All language tags that make use of private use sub-tags must be documented in a corresponding language element in the MEI header whose `id` attribute is the same as the language tag's value.

`xml:space` Allows one to signal to an application whether an element's white space is "significant". The behavior of `xml:space` cascades to all descendant elements, but it can be turned off locally by setting the `xml:space` attribute to the value "default".  
`(att.whitespace)`

While `xml:lang` attribute may be used to encode the language of an element's contents, the `xml:space` attribute lets you define the handling of whitespace, i.e., whitespace being important content (`preserve`) or negligible (`default`). With the latter also being the default value if no `xml:space` attribute is present.

### 2.3.2 Label Attributes

`label` Captures text to be used to generate a label for the element to which it's attached, a "tool tip" or prefatory text, for example. Should not be used to record document content.  
`(att.labelled)`

`n` Provides a number-like designation that indicates an element's position in a sequence of similar elements. May not contain space characters.  
`(att.nNumberLike)`

`n` Provides a numeric designation that indicates an element's position in a sequence of similar elements. Its value must be a non-negative integer.  
`(att.nInteger)`

The `label` and `n` attributes both serve a labeling function; however, they differ in the values they allow. The `n` attribute must be a single token, while `label` may contain a string value that includes spaces. This makes `label` useful for the capture of free-text labels, but a name or number specified with `n` may be easier to process.

```
<!-- Example of a @label containing whitespace: -->
<mdiv label="Allegro moderato">
  <!-- ... -->
</mdiv>
<!-- Example of a processable @n attribute: -->
<measure n="42">
  <!-- ... -->
</measure>
```

Listing 24.

### 2.3.3 Classification Attributes

class Contains one or more URIs which denote classification terms that apply to the entity bearing this attribute.  
[\(att.classed\)](#)

type Designation which characterizes the element in some sense, using any convenient classification scheme or typology that employs single-token labels.  
[\(att.typed\)](#)

### 2.3.4 Responsibility Attributes

resp Indicates the agent(s) responsible for some aspect of the text's transcription, editing, or encoding. Its value must point to one or more identifiers declared in the document header.  
[\(att.responsibility\)](#)

### 2.3.5 Linking Attributes

copyof <a href="#">(att.linked)</a>	Points to an element of which the current element is a copy.
corresp <a href="#">(att.linked)</a>	Used to point to other elements that correspond to this one in a generic fashion.
follows <a href="#">(att.linked)</a>	points to one or more events in a user-defined collection that are known to be predecessors of the current element.
next <a href="#">(att.linked)</a>	Used to point to the next event(s) in a user-defined collection.
precedes <a href="#">(att.linked)</a>	Points to one or more events in a user-defined collection that are known to be successors of the current element.
prev <a href="#">(att.linked)</a>	Points to the previous event(s) in a user-defined collection.
sameas <a href="#">(att.linked)</a>	Points to an element that is the same as the current element but is not a literal copy of the current element.
synch <a href="#">(att.linked)</a>	Points to elements that are synchronous with the current element.

For a detailed description of linking mechanisms used in MEI also see the section on [13 Linking Data](#).

## 2.4 User-defined Symbols

This chapter describes the elements, model classes, and attribute classes that are part of the MEI.usersymbols module.

### 2.4.1 Overview of the Usersymbols Module

The module described in this chapter makes available the following components:

#### 2.4.1.1 Elements

**<anchoredText>** Container for text that is fixed to a particular page location, regardless of changes made to the layout of the measures around it.

**<curve>** A curved line that cannot be represented by a more specific element, such as a slur.

**<line>** A visual line that cannot be represented by a more specific; i.e., semantic, element.

**<symbol>** A reference to a previously defined symbol.

**<symbolDef>** Declaration of an individual symbol in a symbolTable.

**<symbolTable>** Contains a set of user-defined symbols.

#### 2.4.1.2 Attribute Classes

No attribute classes are defined in this module.

#### 2.4.1.3 Model Classes

The usersymbols module defines the following model classes:

`model.graphicPrimitiveLike` `model.symbolTableLike`

### 2.4.2 Uses of the Usersymbols Module

The elements provided by the usersymbols module may be used in two ways:

- For defining lines, curves and text elements that cannot be represented by a more specific element.
- For defining reusable symbols and special graphical renditions.

For this purpose, it provides three elements as graphic primitives, **<line>**, **<curve>** and **<anchoredText>**. Anywhere these elements are allowed, the **<symbol>** element can be used as well. The **<symbol>** element facilitates the re-use of symbols that were defined by **<symbolDef>** elements.

### 2.4.2.1 Defining Reusable Symbols

The `<symbolDef>` element uses SVG markup or the aforementioned graphic primitives to describe a symbol. A symbol definition may also use symbols defined by other `<symbolDef>` elements by employing the `<symbol>` element.

The following code snippet shows a definition of a triangle percussion symbol using graphic primitives:

---

```
<symbolDef xml:id="userSymbols.triangleSymbol3">
  <line x="0" x2="2.55" y="0" y2="4.25"/>
  <line x="2.55" x2="5.1" y="4.25" y2="0"/>
  <line x="5.1" x2="0.85" y="0" y2="0"/>
</symbolDef>
```

Listing 25. Definition of a triangle percussion symbol using graphic primitives

---

Figure 1. Rendition of the triangle defined above

---

The following snippet encodes a symbol composed of the symbol defined above and additional graphics primitives:

---

```
<symbolDef xml:id="userSymbols.triangleSymbolWithStick">
  <symbol ref="#userSymbols.triangleSymbol3"/>
  <line x="2.55" x2="5.95" y="1.25" y2="3.4"/>
</symbolDef>
```

Listing 26. Symbol composed of the symbol defined above and additional graphics primitives

---

Figure 2. Rendition of the composite triangle symbol

---

### 2.4.2.2 Elements Without Semantic Implications

The graphics primitives and symbols can be used directly in the music to describe text and lines on a purely graphical level, without implying a specific logical meaning. If possible, however, more meaningful elements should be used. This means for example, "a tempo" or "da capo" should in general not be put inside `<anchored-Text>`. Instead, `<tempo>` and `<dir>` should be used. Likewise, slurs and ties should be encoded using their respective elements, not using `<curve>`, and for glissandi, `<gliss>` should be used instead of `<line>`.

An example usage for `<line>` is the visualization of voice leading, which is not covered by a specific MEI element.

Figure 3. Voice leading visualization as found in an Edition Peters print of Album für die Jugend by Schumann, No. 35 (Mignon), measure 6. (Unknown date, plate number is 10478.)

The following code snippet shows the encoding of the above example:

```

<measure n="6">
  <staff n="1">
    <layer n="1">
      <rest dur="4" xml:id="userSymbols.r1"/>
      <beam>
        <note dur="8" oct="4" pname="c" xml:id="userSymbols.n1"/>
        <note dur="8" oct="4" pname="e" xml:id="userSymbols.n2"/>
      </beam>
      <beam>
        <note dur="8" oct="4" pname="g" xml:id="userSymbols.n3"/>
        <note dur="8" oct="4" pname="e" xml:id="userSymbols.n4"/>
        <note dur="8" oct="4" pname="b" xml:id="userSymbols.n5"/>
        <note dur="8" oct="4" pname="g" xml:id="userSymbols.n6"/>
      </beam>
      <slur curvedir="above" endid="#userSymbols.n6" startid="#userSymbols.n1"/>
    </layer>
  </staff>
</measure>

```

```

<layer n="2">
  <rest dur="4"/>
  <note dur="2" next="#userSymbols.n9" oct="4" pname="c" stem.dir="down"
    xml:id="userSymbols.n7"/>
</layer>
</staff>
<staff n="2">
  <layer n="1">
    <note dots="1" dur="2" oct="2" pname="g" xml:id="userSymbols.n8"/>
    <note dur="4" oct="3" pname="b" prev="#userSymbols.n7" #userSymbols.n8"
      xml:id="userSymbols.n9"/>
    <slur curvedir="above" endid="#userSymbols.n9" startid="#userSymbols.n8"/>
  </layer>
</staff>
<line endid="#userSymbols.n9" rend="dotted" startid="#userSymbols.n7"/>
</measure>

```

Listing 27. Encoding of the Schumann example

#### 2.4.2.3 Defining a Specific Graphical Rendition for a Semantic Element

Usersymbols can define the rendition of different elements in two ways. Some elements, for example `<dir>` and `<tempo>`, can have user symbol elements as content. In the following example, the content of `<dir>` is used to provide pictograms of percussion instruments.

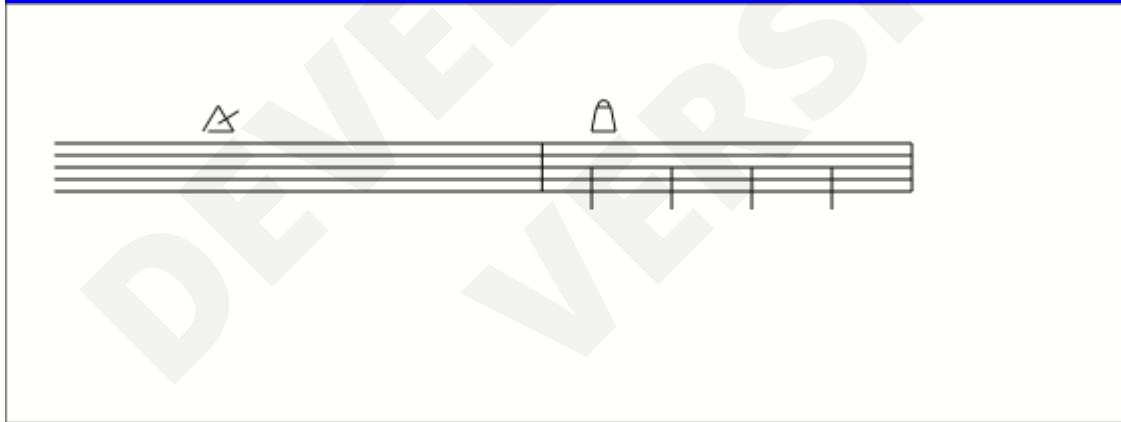

Figure 4. Indicating percussion instruments using pictograms

The corresponding encoding would be as follows:

```

<section>
  <scoreDef meter.count="4" meter.unit="4">

```

```

<symbolTable>
  <symbolDef xml:id="userSymbols.triangleSymbol1">
    <line x="0" x2="2.55" y="0" y2="4.25"/>
    <line x="2.55" x2="5.1" y="4.25" y2="0"/>
    <line x="5.1" x2="0.85" y="0" y2="0"/>
    <line x="2.55" x2="5.95" y="1.25" y2="3.4"/>
  </symbolDef>
  <symbolDef xml:id="userSymbols.cowbellSymbol1">
    <line x="1" x2="1.8" y="0" y2="4"/>
    <line x="1.8" x2="4.2" y="4" y2="4"/>
    <line x="4.2" x2="5" y="4" y2="0"/>
    <line x="5" x2="1" y="0" y2="0"/>
    <curve bezier="0 1.5 0 1.5" endho="3" endvo="4" startho="1" startvo="4"/>
  </symbolDef>
</symbolTable>
<staffGrp>
  <staffDef clef.line="2" clef.shape="G" n="1"/>
</staffGrp>
</scoreDef>
<measure n="1">
  <staffDef n="1">
    <instrDef midi.instrname="Open_Triangle"/>
  </staffDef>
  <staff n="1">
    <layer>
      <dir tstamp="1">
        <symbol ref="#userSymbols.triangleSymbol2"/>
      </dir>
      <note dur="1"/>
    </layer>
  </staff>
</measure>
<measure n="2">
  <staffDef n="1">
    <instrDef midi.instrname="Cowbell"/>
  </staffDef>
  <staff n="1">
    <layer>
      <dir tstamp="1">
        <symbol ref="#userSymbols.cowbellSymbol"/>
      </dir>
      <note dur="4"/>
      <note dur="4"/>
      <note dur="4"/>
      <note dur="4"/>
    </layer>
  </staff>
</measure>
</section>

```

Listing 28. Encoding of above example

A number of elements can point to an internally-defined symbol for rendering using the altsym attribute.

Figure 5. Different treble clef renditions as written by Charpentier (source: Journal of Seventeenth-Century Music, Volume 12, No. 1 (2006), figure 3) <http://www.sscm-jscm.org/v12/no1/gosine.html>

```

<scoreDef>
  <symbolTable>
    <symbolDef xml:id="userSymbols.clefA">
      <curve bezier="-1.2 0.1 -0.9 -0.8" endho="1.1" endvo="6.6" startho="1.2" startvo="4"/>
      <curve bezier="1 0.9 0.1 1.6" endho="3" endvo="5.3" startho="1.1" startvo="6.6"/>
      <curve bezier="-0.1 -2.6 0 2.3" endho="0.6" endvo="-0.1" startho="3" startvo=" 5.3"/>
      <curve bezier="0.07 -1.3 -0.2 -1.63" endho="2.4" endvo="0.23" startho="0.6"

  <staffGrp>
    <staffDef n="1">
      <clef altsym="#userSymbols.clefA" line="2" shape="G"/>
    </staffDef>
    <staffDef n="2">
      <clef altsym="#userSymbols.clefB" line="2" shape="G"/>
    </staffDef>
  </staffGrp>
</scoreDef>

```

Listing 29. Defining two staves, each using its own treble clef shape

Externally-defined symbols may be referenced using a glyph.name or glyph.num attribute from the `att.extSym` attribute class. Both attributes refer to Standard Music Font Layout (SMuFL) characters, if not specified differently by the `glyph.auth` and `glyph.uri` attributes.

```
<ornam tstamp="1">
  <symbol glyph.auth="smuf1" glyph.num="#xE5C0"
    glyph.name="ornamentPrecompDoubleCadenceLowerPrefix"/>
</ornam>
```

Listing 30. Use of `glyph.auth` and `glyph.name` and `glyph.num` attributes to refer to a SMuFL symbol

```
<meterSig count="2" form="norm" glyph.name="timeSigCutCommon" glyph.num="U+E08B" sym="cut"
  unit="4"/>
```

Listing 31. Use of `glyph.name` and `glyph.num` attributes

## 2.4.3 Positioning and Coordinates

### 2.4.3.1 Axis Orientation

MEI uses the classic axis directions where the x-axis points from left to right and the y-axis points from bottom up. (This is compatible with PostScript's axis orientation, while SVG's y-axis points in the opposite direction.)

### 2.4.3.2 Units

There are two types of units used by MEI: Staff units and units of the output coordinate system. Units of the output coordinate system can be translated to physical real world distances by means of the `vu.height` and `page.scale` of a `<scoreDef>` element. Real world units are multiplied by the value of `page.scale` to get the corresponding value in output coordinate units.

If an element is scaled using the `scale` attribute, the actual size of the units changes accordingly.

### 2.4.3.3 Positioning

An element may be positioned using either absolute or relative coordinates. If absolute start point coordinates are specified using x/y coordinates (or their relatives x2/y2 for endpoints) they take precedence over relative positions specified by ho/vo/to (or startho/startvo/startto). Analogously, x2/y2 override endho/endvo/endto.

If to/startto/endto attributes are used, the start or end point is x-aligned with the indicated timestamp.

If relative start coordinates (ho/vo or startho/startvo) are used, the origin of the coordinate system to be used for the start point is the first one found by the following search schema:

- If `startid` is present, the origin of the referenced element;
- If the element is inside running text (e.g., inside `tempo`), the end of the preceding text or element;

- Otherwise, the origin of the containing element.

The start point is offset from this origin by the value of the start coordinates (ho/vo or startho/startvo), using staff units.

Analogously, the endpoint is determined using end coordinates (endho/endvo). If endid is specified, it takes precedence over startid.

Examples of origins are:

- **staff** and **layer**: The horizontal origin is the starting point of the measure, the vertical one is the bottom staff line;
- **note**: The horizontal origin is the left end of the notehead, the vertical one is the center of the notehead;
- **clef**: The horizontal origin is the left end of the clef, the vertical one the line specified by **clef/line** (or **clef.line**);
- For elements containing text: The left end of the baseline;
- **symbolDef**: As symbol definitions aren't rendered directly, their coordinate system and origin are considered virtual.

When they are referenced by **<symbol>** or **altsym**, the origin of the context, i.e., the referencing symbol, is used. If neither absolute nor relative coordinates are specified, determining visually suitable start and end points for line and curve attributes is left to the rendering application. A value of 0 is not always assumed for absent relative coordinates. A typical example where a rendering application may not choose the origins of absent relative start and end coordinates to be the start point as well is the line connecting two notes in the above Schumann example.

#### 2.4.3.4 Curve Shape

If neither a **bezier** nor **bulge** attribute is present, the renderer determines a suitable shape. However, if **curvedir** is present, the curve must respect the curvature direction specified there.

The attributes **bezier** and **bulge** define the shape of a curve in two different ways. If both are present, a rendering application may choose either one. They override **curvedir**.

**bezier** defines the inner control points of a cubic Bézier curve, i.e., a Bézier curve with two inner control points. The coordinates are given by a space separated list, first x and y offsets for the first control point, then x and y offsets for the second one. The x and y offsets are given in staff units (or inside the context of **<symbolDef>** in abstract units). The offsets for the first inner control point are relative to the start point, the ones for the second inner control point are relative to the end point.

The **bulge** attribute allows specification of the curve shape by a number of interpolation points. The interpolation points are given by their distance from the line connecting the start and end point. The distance values are stored as a space separated list.

The interpolation points are calculated as follows: If bulge provides  $n$  distance values, the connection line is divided into  $n+1$  subsegments of equal length. The interpolation points are found by drawing a perpendicular line of the respective length at each subsegment joint. Positive distance values are drawn to the left of the connection line (left when traveling from start to end), negative ones to the right.

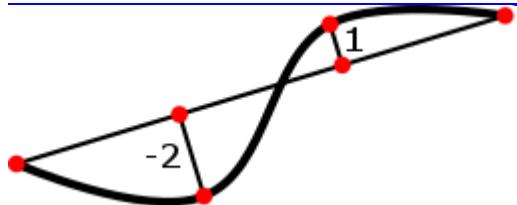

Figure 6. Rendering a bulge attribute with value "-2 1"

The interpolation algorithm used by the rendering application is implementation dependent.

#### 2.4.4 Line Rendition

The form attribute of lines may take the following values:

- dashed
- dotted
- solid
- wavy

These attribute values are only qualitative. Actual dash length and dot and dash spacing are implementation dependent.

The width attribute may take the following values:

- narrow
- medium
- wide

These values are also qualitative, however, they are also relative. That is, 'narrow' is the default value, 'medium' is twice as wide as 'narrow', and 'wide' is twice as wide as 'medium'.

In addition to these textual values, the width attribute may contain a numeric value and an optional unit value, 2mm for example. If the unit value is not provided, staff interline units are presumed.

The `Istartsym` and `lendsym` attributes name the symbol that may start and/or end a line, while `Istartsymsize` and `lendsymsize` indicate the relative size of the symbol using a numeric value in the range from 1 to 9.

## 2.4.5 Limitations

The usersymbols module does not currently support continuous composite lines or filled areas. As mentioned above, the rendition of lines is highly implementation dependent. Coordinate system transforms are restricted to scaling using scale.

DEVELOPMENT  
VERSION

### 3 Metadata in MEI

DEVELOPMENT  
VERSION

## 3.1 Introduction

Metadata means "data about data", i.e., information about various aspects of an encoding at hand. There are many different types of metadata, which MEI tries to order according to their respective scope or perspective, as described in [3.2 Structure of the MEI Header](#). MEI's approach to metadata is heavily influenced by other existing standards and models, such as TEI, MARC, and FRBR. It attempts to reflect both current library practice and common scholarly methods, for example in the field of source descriptions (see chapter [3.7 Encoding Sources in MEI](#)).

This chapter thus addresses the description of an encoded item so that the musical text, as well as its sources, encoding, and revisions are all thoroughly documented. Such documentation is necessary for scholars using the texts, for software processing them, and for catalogers in libraries and archives. Together these descriptions and declarations provide an electronic analog to the title page attached to a printed work. They also constitute an equivalent for the content of the code books or introductory manuals customarily accompanying electronic data sets.

## 3.2 Structure of the MEI Header

Every MEI-conformant text not embedded in another XML carrier that provides for capturing metadata, such as TEI or METS, must carry a set of descriptions, prefixed to it and encoded as described in this chapter. This set is known as the MEI header, tagged [`<meiHead>`](#).

The metadata encoded inside [`<meiHead>`](#) covers a number of different use cases. Some child elements like [`<titleStmt>`](#) may appear in various places (see [3.3.1 Title Statement](#)), so it is important to understand the roles of the different areas of the MEI header. These areas are described following their order of appearance within the [`<meiHead>`](#) element:

- Zero or more *alternative identifiers*, tagged with [`altId`](#), each of which provides an identifying name or number associated with the file. This is just a simple element that helps to preserve other external identifiers for a file, such as database keys.
- A *file description*, tagged [`fileDesc`](#), containing a full bibliographic description of the computer file itself. From the information contained here, a user of the encoding should be able to derive a proper bibliographic citation, and a librarian or archivist could use it for creating a catalog entry recording its presence within a library or archive. A [`titleStmt`](#) within [`fileDesc`](#) captures the *title of the file*, which may be different than the [`title`](#) of the encoded work, or the title given on any of the *sources* used to generate the file. The term *computer file* here is to be understood as referring to the whole intellectual entity or document described by the header, even when this is stored in multiple physical operating system files. The file description also includes information about the [`source`](#) or sources from which the electronic document was derived (not to be confused with sources that represent or witness the encoded work in a more general sense; these may be described within the [`manifestationList`](#) element).
- The MEI elements used to encode the file description are described in section [3.4 Information about an MEI file](#).
- An optional *encoding description*, tagged [`encodingDesc`](#), which describes the relationship between an electronic text and its source or sources. It allows for detailed description of whether (or how) the text was normalized during transcription, how the encoder resolved ambiguities in the source, what levels of encoding or analysis were applied, and similar matters.
- The MEI elements used to encode the encoding description are described in section [3.4.2 Encoding Description](#).
- An optional *work description* or list of the works encoded or described in the file, tagged [`workList`](#), containing classification and contextual information about the work(s), such as its subject matter, the situation in which it was produced, the individuals described by or participating in producing it, and so forth. Such a work profile is of particular use in highly structured composite texts such as corpora or language collections, where it is often highly desirable to enforce a controlled descriptive vocabulary or to perform retrievals from a body of text in terms of text type or origin. The work description may however be of use in any form of automatic text processing.
- The MEI elements used to encode the work description are described in section [3.6 Work Description](#).

- An optional list of manifestations of the work, tagged [manifestationList](#), containing descriptions of sources ("manifestations" in [3.5 Functional Requirements for Bibliographic Records \(FRBR\)](#) terms) that represent or witness the encoded work in some way, regardless of whether the encoding is based on these sources or not; for instance, it is useful for listing all known sources to a particular work in a cataloging project or a critical edition.
- The MEI elements used to encode the source description are described in section [3.7 Encoding Sources in MEI](#).
- Zero or more elements tagged [extMeta](#), containing *non-MEI metadata*.
- This concept is covered in section [3.8 Typical Use Cases](#).
- A *revision history*, tagged [revisionDesc](#), which allows the encoder to provide a history of changes made during the development of the electronic text. The revision history is important for version control and for resolving questions about the history of a file. The MEI elements used to encode the revision description are described in section [3.4.3 Revision Description](#).

## 3.3 Common Metadata Concepts

This chapter introduces data models and markup available in various locations of the MEI header.

### 3.3.1 Title Statement

The `<titleStmt>` element is to capture the title of an MEI file (within a `<fileDesc>` element) and the title of any of the relevant `<manifestation>`s (sources) of the encoded work.

**<titleStmt>** Container for title and responsibility meta-data.

The title statement contains the title given to the electronic work, together with one or more optional statements of responsibility which identify the encoder, editor, author, compiler, or other parties responsible for it:

**<title>** Title of a bibliographic entity.

**<arranger>** A person or organization who transcribes a musical composition, usually for a different medium from that of the original; in an arrangement the musical substance remains essentially unchanged.

**<author>** The name of the creator of the intellectual content of a non-musical, literary work.

**<composer>** The name of the creator of the intellectual content of a musical work.

**<contributor>** Names of individuals, institutions, or organizations responsible for contributions to the intellectual content of a work, where the specialized elements for authors, editors, etc. do not suffice or do not apply.

**<editor>** The name of the individual(s), institution(s) or organization(s) acting in an editorial capacity.

**<funder>** Names of individuals, institutions, or organizations responsible for funding. Funders provide financial support for a project; they are distinct from sponsors, who provide intellectual support and authority.

**<librettist>** Person or organization who is a writer of the text of an opera, oratorio, etc.

**<lyricist>** Person or organization who is a writer of the text of a song.

**<sponsor>** Names of sponsoring individuals, organizations or institutions. Sponsors give their intellectual authority to a project; they are to be distinguished from funders, who provide the funding but do not necessarily take intellectual responsibility.

**<respStmt>** Transcription of text that names one or more individuals, groups, or in rare cases, mechanical processes, responsible for creation, realization, production, funding, or distribution of the intellectual or artistic content.

The `<title>` element contains the chief name of the electronic work. Its content takes the form considered appropriate by its creator. The element may be repeated, if the work has more than one title (perhaps in different languages). Where the electronic work is derived from an existing source text, it is strongly recommended that the title for the former should be derived from the latter, but clearly distinguishable from it, for example by the addition of a phrase such as ': an electronic transcription' or 'a digital edition'. This will distinguish the electronic work from the source text in citations and in catalogs, which contain descriptions of both types of material.

```
<titleStmt>
  <title>Lieder-Album für die Jugend</title>
  <title type="subtitle">für Singstimme(n) und Klavier,
    <identifier>op. 79</identifier>
  </title>
  <title type="subtitle">an electronic transcription</title>
</titleStmt>
```

---

Listing 32.

Other alternative titles or subtitles may be encoded in additional title elements with values in the type attribute that distinguish them from the chief title. Sample values for the type attribute include: main (main title), subordinate (subtitle, title of part), abbreviated (abbreviated form of title), alternative (alternate title by which the work is also known), translated (translated form of title), uniform (collective title).

The type attribute is provided for convenience in analyzing titles and processing them according to their type; where such specialized processing is not necessary, there is no need for such analysis, and the entire title, including subtitles and any parallel titles, may be enclosed within a single `<title>` element, as in the following example:

---

```
<title>Symphony No. 5 in C Minor : an electronic transcription</title>
```

---

Listing 33.

The electronic work will also have an external name (its ‘filename’ or ‘data set name’) or reference number on the computer system where it resides at any time. This name is likely to change frequently, as new copies of the file are made on the computer system. Its form is entirely dependent on the particular computer system in use and thus cannot always easily be transferred from one system to another. Moreover, a given work may be composed of many files. For these reasons, these Guidelines strongly recommend that such names should not be used as the title for any electronic work.

Helpful guidance on the formulation of useful descriptive titles in difficult cases may be found in the Anglo-American Cataloguing Rules (Gorman and Winkler, 1978, chapter 25) or in equivalent national-level bibliographical documentation.

It is important to keep in mind that the `<titleStmt>` element provides *structured* metadata. Preserving the exact rendition of a title page is possible using the `<titlePage>` element (see [3.7.1 Title Pages](#)).

The title of a `<work>` is given by using the `<title>` element directly, as many other child elements of `<titleStmt>` are available on work directly.

### 3.3.2 Responsibility Attribution

In scholarly work, attribution of responsibility is crucial. For this purpose, MEI offers the `<respStmt>` element, which is available in the following contexts:

**<analytic>** Contains bibliographic elements describing an item (e.g., an article or poem) published within a monograph or journal and not as an independent publication.

**<bib>** Provides a loosely-structured bibliographic citation in which the sub-components may or may not be explicitly marked.

**<change>** Individual change within the revision description.

**<edition>** A word or text phrase that indicates a difference in either content or form between the item being described and a related item previously issued by the same publisher/distributor (e.g., 2nd edition, version 2.0, etc.), or simultaneously issued by either the same publisher/distributor or another publisher/distributor (e.g., large print edition, British edition, etc.).

**<editionStmt>** Container for meta-data pertaining to a particular edition of the material being described.

**<genState>** Describes a distinctive state in the textual development of a work.

**<imprint>** Information relating to the publication or distribution of a bibliographic item.

**<monogr>** Contains bibliographic elements describing an item, for example, a published book or journal, score, recording, or an unpublished manuscript.

**<pubStmt>** Container for information regarding the publication or distribution of a bibliographic item, including the publisher's name and address, the date of publication, and other relevant details.

**<series>** Contains information about the serial publication in which a bibliographic item has appeared.

**<seriesStmt>** Groups information about the series, if any, to which a publication belongs.

**<titleStmt>** Container for title and responsibility meta-data.

At a minimum, the creator of the musical text and the creator of the file should be identified. If the bibliographic description is for a corpus, identify the creator of the corpus. Optionally also include the names of others involved in the transcription or elaboration of the text, sponsors, and funding agencies. The name of the person responsible for physical data input need not normally be recorded, unless that person is also intellectually responsible for some aspect of the creation of the file.

In traditional bibliographic practice, those with primary creative responsibility are given special prominence. MEI accommodates this approach by providing responsibility-role elements. For example:

```
<titleStmt>
  <title>Auf dem Hügel sitz ich spähend : an electronic transcription</title>
  <composer>Ludwig van Beethoven</composer>
  <lyricist>Aloys Jeitteles</lyricist>
</titleStmt>
```

Listing 34.

Secondary intellectual responsibility in this case is encoded using **<respStmt>**. The **<respStmt>** element has two subcomponents: a **<name>** element identifying a responsible individual or organization, and a **<resp>** element indicating the nature of the responsibility. All names should be stated in the form in which the persons or bodies

wish to be publicly cited. This will usually be the fullest form of the name, including first names. No specific recommendations are made at this time as to appropriate content for `<resp>`. However, it should make clear the nature of the responsibility.

---

```
<titleStmt>
  <title>Auf dem Hügel sitz ich spähend : an electronic transcription</title>
  <composer>Ludwig van Beethoven</composer>
  <lyricist>Aloys Jeitteles</lyricist>
  <respStmt>
    <resp>Encoded by</resp>
    <name>Maja Hartwig</name>
    <name>Kristina Richts</name>
  </respStmt>
</titleStmt>
```

Listing 35.

---

This method of encoding facilitates exchange of bibliographic data with library catalogs and bibliographic databases as well as applications whose handling of bibliographic data is restricted to traditional responsibility roles. Additional information regarding these responsibility-role elements can be found in chapter [9.2.12 Bibliographic Citations and References](#).

When the MEI.namesdates module is enabled, two additional elements are also permitted within `<respStmt>`:

**<corpName>** Identifies an organization or group of people that acts as a single entity.

**<persName>** Designation for an individual, including any or all of that individual's forenames, surnames, honorific titles, and added names.

These elements allow for more precise identification of the entity associated with the name than is permitted by the simpler `<name>` element. The following example shows how a precise date range can be associated with a personal or corporate name.

---

```
<respStmt>
  <resp>Machine-readable transcription by:</resp>
  <persName enddate="1940-11-06" startdate="1860-01-01">John Doe</persName>
</respStmt>
```

Listing 36.

---

For additional information about corporate and personal names, see chapter [9.2.8 Names](#).

In addition to, or instead of the `<resp>` element, the role attribute on `<name>`, `<persName>`, and `<corpName>` may be used to capture the nature of responsibility. While `<resp>` accommodates capturing the wide variety of text that may occur in responsibility statements, use of the role attribute provides the possibility of recording a controlled value independently of the textual content of `<resp>`.

```
<respStmt>
  <resp>Encoded by</resp>
  <corpName role="encoder">Members of the Local Symphony Orchestra</corpName>
</respStmt>
```

Listing 37.

Values from the MARC relator code list (<http://www.loc.gov/marc/relators/relacode.html>) or term list (<http://www.loc.gov/marc/relators/relaterm.html>) are recommended for role, where applicable.

Where it is necessary to group responsibilities and names, multiple responsibility statements may be used. For example:

```
<titleStmt>
  <title>Symphony No. 5 in C Minor : an electronic transcription</title>
  <respStmt>
    <resp>Encoded by</resp>
    <persName role="encoder">Joe Encoder</persName>
    <persName role="encoder">Jane Decoder</persName>
  </respStmt>
  <respStmt>
    <resp>Images scanned by</resp>
    <persName>Ludwig van Ludwig</persName>
  </respStmt>
</titleStmt>
```

Listing 38.

It is often desirable to mix primary and secondary intellectual responsibility information. Treating all intellectual roles the same way can allow literal transcription of existing responsibility statements and simplify programmatic processing. The following example demonstrates how a responsibility statement may be transcribed using interleaved `<resp>` and `<persName>` elements:

```
<titleStmt>
  <title>Symphony No. 5 in C Minor : an electronic transcription</title>
  <respStmt>
    <resp>Composed by:</resp>
```

```
<persName role="composer">Ludwig van Beethoven</persName>
<persName role="encoder">Johannes Jones:</persName>
<resp>Machine-readable transcription</resp>
</respStmt>
</titleStmt>
```

Listing 39.

However, eliminating explanatory text and relying on standardized values for role, as in the following example, allows data creation and processing tools of the greatest simplicity.

---

```
<titleStmt>
  <title>Symphony No. 5 in C Minor : an electronic transcription</title>
  <respStmt>
    <persName role="composer">Ludwig van Beethoven</persName>
    <persName role="editor">Johannes Jones</persName>
  </respStmt>
</titleStmt>
```

Listing 40.

## 3.4 Information about an MEI file

### 3.4.1 File Description

The structure of the bibliographic description of a machine-readable or digital musical text resembles that of a book, an article, or other kinds of textual objects. The file description element of the MEI header has therefore been closely modelled on existing standards in library cataloging; it should thus provide enough information to allow users to give standard bibliographic references to the electronic text, and to allow catalogers to catalog it. Bibliographic citations occurring elsewhere in the header, and in the text itself, are derived from the same model.

The bibliographic description of an electronic musical text should be supplied by the mandatory `<fileDesc>` element:

**<fileDesc>** Contains a full bibliographic description of the MEI file.

The `<fileDesc>` element contains two mandatory and six optional elements, each of which is described in more detail below. These elements are listed below in the order in which they must occur within the `<fileDesc>` element.

**<titleStmt>** Container for title and responsibility meta-data.

**<editionStmt>** Container for meta-data pertaining to a particular edition of the material being described.

**<extent>** Used to express size in terms other than physical dimensions, such as number of pages, records, bytes, physical components, etc.

**<pubStmt>** Container for information regarding the publication or distribution of a bibliographic item, including the publisher's name and address, the date of publication, and other relevant details.

**<seriesStmt>** Groups information about the series, if any, to which a publication belongs.

**<notesStmt>** (notes statement)– Collects any notes providing information about a text additional to that recorded in other parts of the bibliographic description.

**<sourceDesc>** A container for the descriptions of the source(s) used in the creation of the electronic file.

A complete file description will resemble the following example:

```
<fileDesc>
  <titleStmt>
    <!-- title of the resource -->
  </titleStmt>
  <editionStmt>
    <!-- information about the edition of the resource -->
  </editionStmt>
  <extent>
    <!-- description of the size of the resource -->
  </extent>
```

```
<pubStmt>
  <!-- information about the publication and distribution of the resource -->
</pubStmt>
<seriesStmt>
  <!-- information about any series to which the resource belongs -->
</seriesStmt>
<notesStmt>
  <!-- notes on other aspects of the resource -->
</notesStmt>
<sourceDesc>
  <!-- information about the source(s) from which the resource was derived -->
</sourceDesc>
</fileDesc>
```

Listing 41.

### 3.4.1.1 Edition Statement

The `<editionStmt>` element is the second component of the `<fileDesc>` element, following the mandatory `<titleStmt>`. It is optional but recommended when applicable.

**<editionStmt>** Container for meta-data pertaining to a particular edition of the material being described.

It contains elements for identifying the edition and those responsible for it:

**<edition>** A word or text phrase that indicates a difference in either content or form between the item being described and a related item previously issued by the same publisher/distributor (e.g., 2nd edition, version 2.0, etc.), or simultaneously issued by either the same publisher/distributor or another publisher/distributor (e.g., large print edition, British edition, etc.).

**<respStmt>** Transcription of text that names one or more individuals, groups, or in rare cases, mechanical processes, responsible for creation, realization, production, funding, or distribution of the intellectual or artistic content.

For printed texts, the term 'edition' applies to the set of all the identical copies of an item produced from one master copy and issued by a particular publishing agency or a group of such agencies. A change in the identity of the distributing body or bodies does not normally constitute a change of edition, while a change in the master copy does.

For electronic texts, the notion of a master copy is not entirely appropriate, since they are far more easily copied and modified than printed ones; nonetheless, the term edition may be used for a particular state of a machine-readable text at which substantive changes are made and fixed. Synonymous terms used in these Guidelines are version, level, and release. The words revision and update, by contrast, are used for minor changes to a file which do not amount to a new edition.

No simple rule can specify how substantive changes have to be before they are regarded as producing a new edition, rather than a simple update. The general principle proposed here is that the production of a new edition entails a significant change in the intellectual content of the file, rather than its encoding or appearance. The addition of analytic coding to a text would thus constitute a new edition, while automatic conversion from one coded representation to another would not. Changes relating to the character code or physical storage details, corrections of misspellings, simple changes in the arrangement of the contents and changes in the output format do not normally constitute a new edition, whereas the addition of new information (e.g., annotations, sound or images, links to external data) almost always does.

Clearly, there will always be borderline cases and the matter is somewhat arbitrary. The simplest rule is: if you think that your file is a new edition, then call it such. An edition statement is optional for the first release of a computer file; it is mandatory for each later release, though this requirement cannot be enforced.

Note that all changes in a file, whether or not they are regarded as constituting a new edition or simply a revision, should be independently noted in the revision description section of the file header (see section [3.4.3 Revision Description](#)).

The edition element should contain phrases describing the edition or version, including the word 'edition', 'version', or an equivalent term, together with a number or date, or terms indicating difference from other editions such as 'new edition', 'revised edition', etc. Any dates that occur within the edition statement should be marked with the `<date>` element. The `n` attribute of the edition element may be used as elsewhere to supply any formal identification (such as a version number) for the edition.

One or more `<respStmt>` elements may also be used to supply statements of responsibility for the edition in question. These may refer to individuals or corporate bodies and can indicate functions such as that of a reviser, or can name the person or body responsible for the provision of supplementary matter, of appendices, etc., in a new edition.

Some examples follow:

```
<editionStmt>
  <edition n="Draft2">Second draft, substantially extended, revised, and corrected.</edition>
</editionStmt>
```

Listing 42.

```
<editionStmt>
  <edition>Student's edition,
    <date>June 1987</date>
  </edition>
  <respStmt>
    <resp>New annotations by</resp>
    <name>George Brown</name>
```

```
</respStmt>  
</editionStmt>
```

Listing 43.

---

### 3.4.1.2 Extent of the File

The third component of the fileDesc is a description of the physical qualities of the file. The [<extent>](#) element is provided for this purpose.

**<extent>** Used to express size in terms other than physical dimensions, such as number of pages, records, bytes, physical components, etc.

The [<extent>](#) element describes the approximate size of a text as stored on some carrier medium, whether digital or non-digital, specified in any convenient units.

For printed books, information about the carrier, such as the kind of medium used and its size, are of great importance in cataloging procedures. The print-oriented rules for bibliographic description of an item's medium and extent need some re-interpretation when applied to electronic media. An electronic file exists as a distinct entity quite independently of its carrier and remains the same intellectual object whether it is stored as file on a hard disc drive, a CD-ROM, a set of USB devices, or in the internet. Since, moreover, these Guidelines are specifically aimed at facilitating transparent document storage and interchange, any purely machine-dependent information should be irrelevant as far as the file header is concerned.

This is particularly true of information about file-type although library-oriented rules for cataloging often distinguish two types of computer file: 'data' and 'programs'. This distinction is quite difficult to draw in some cases, for example, hypermedia or texts with built-in search and retrieval software.

Although it is equally system-dependent, some measure of the size of the computer file may be of use for cataloging and other practical purposes. Because the measurement and expression of file size is fraught with difficulties, only very general recommendations are possible; the element [<extent>](#) should contain a phrase indicating the size or approximate size of the computer file in one of the following ways:

- in bytes of a specified length (e.g., '4000 bytes')
- as falling within a range of values, for example:
  - less than 1 Mb
  - between 1 Mb and 5 Mb
  - between 6 Mb and 10 Mb
  - over 10 Mb
- in terms of any convenient logical units (for example, words or sentences, citations, paragraphs)
- in terms of any convenient physical units (for example, compact discs, removable hard drives, DVDs)

The use of standard abbreviations for units of quantity is recommended where applicable, here as elsewhere (see <http://physics.nist.gov/cuu/Units/binary.html>).

```
<extent>between 1 MB and 2 MB</extent>
<!-- or -->
<extent>4.2 MiB</extent>
<!-- or -->
<extent>4532 Mbytes</extent>
<!-- or -->
<extent>3200 sentences</extent>
<!-- or -->
<extent>5 90-mm high density diskettes</extent>
```

Listing 44.

For ease of processability, the use of the unit attribute is recommended whenever possible, as in the following example:

```
<extent unit="byte">65535</extent>
```

Listing 45.

The unit attribute is restricted to certain values: byte (Byte), char (Character), cm (Centimeter), deg (Degree), in (Inch), issue (Serial issue), ft (Foot), m (Meter), mm (Millimeter), page (Page), pc (Pica), pt (Point), px (Pixel), rad (Radian), record (Record), vol (Serial volume), and vu (MEI virtual unit).

A virtual unit (vu) in MEI is a measure of distance. It is determined by half the distance between adjacent staff lines where the interline space is measured from the middle of a staff line. Unless otherwise specified, the MEI virtual unit is set as the default unit.

### 3.4.1.3 Publication, Distribution, etc.

The `<pubStmt>` element is the fourth component of the `<fileDesc>` element and is mandatory.

**<pubStmt>** Container for information regarding the publication or distribution of a bibliographic item, including the publisher's name and address, the date of publication, and other relevant details.

It may contain either a single `<unpub>` element, indicating that the file has yet to be published, or in the case of published material, one or more elements from the `model.pubStmtPart` class. The following elements may be used to provide details regarding the file's publication and distribution:

**<address>** Contains a postal address, for example of a publisher, an organization, or an individual.

**<availability>** Groups elements that describe the availability of and access to a bibliographic item, including an MEI-encoded document.

**<date>** A string identifying a point in time or the time period between two such points.

**<distributor>** Person or agency, other than a publisher, from which access (including electronic access) to a bibliographic entity may be obtained.

**<identifier>** An alpha-numeric string that establishes the identity of the described material.

**<publisher>** Name of the organization responsible for the publication of a bibliographic item.

**<pubPlace>** Name of the place where a bibliographic item was published.

**<respStmt>** Transcription of text that names one or more individuals, groups, or in rare cases, mechanical processes, responsible for creation, realization, production, funding, or distribution of the intellectual or artistic content.

The publisher is the person or institution by whose authority a given edition of the file is made public. The distributor is the person or institution from whom copies of the text may be obtained. Use **<respStmt>** to identify other responsible persons or corporate bodies.

The sub-elements of **<availability>** should be used to provide detailed information regarding access to the MEI file.

**<accessRestrict>** Describes the conditions that affect the accessibility of material.

**<distributor>** Person or agency, other than a publisher, from which access (including electronic access) to a bibliographic entity may be obtained.

**<price>** The cost of access to a bibliographic item.

**<sysReq>** System requirements for using the electronic item.

**<useRestrict>** Container for information about the conditions that affect use of a bibliographic item after access has been granted.

---

```
<pubStmt>
  <publisher>
    <corpName>Musikwissenschaftliches Seminar <Detmold></corpName>
  </publisher>
  <address>
    <addrLine>Gartenstrasse 20</addrLine>
    <addrLine>32756
      <geogName>Detmold</geogName>
    </addrLine>
    <addrLine>
      <geogName>Germany</geogName>
    </addrLine>
  </address>
  <date>2011</date>
  <availability>
```

```

<useRestrict>© 2004, MEI Consortium</useRestrict>
</availability>
</pubStmt>
```

Listing 46.

```

<pubStmt>
  <publisher>
    <corpName>Segno Press Inc.</corpName>
  </publisher>
  <distributor>
    <corpName>University of Virginia</corpName>
    <address>
      <addrLine>221 B LowWater Street,</addrLine>
      <addrLine>Charlottesville, Virginia</addrLine>
      <addrLine>22901</addrLine>
    </address>
  </distributor>
  <date>2010</date>
  <identifier>1234</identifier>
  <availability>
    <useRestrict>Available for purposes of academic research and teaching only.</useRestrict>
  </availability>
</pubStmt>
```

Listing 47.

Give any other useful information (e.g., dates of collection of data) in an annotation within the notes statement, which is described below.

Here, as in the description of intellectual responsibility described above, the `<respStmt>` element may be used to contain all statements of responsibility regarding publication and distribution when uniformity is desired regardless of the role of participants in the publication process:

```

<respStmt>
  <corpName role="publisher">MEI Project</corpName>
  <corpName auth.uri="http://d-nb.info/gnd" auth="GND" codedval="2007744-0" role="funder">German
  Research Foundation</corpName>
  <corpName auth.uri="http://d-nb.info/gnd/18183-3" auth="Deutsche Nationalbibliothek"
  codedval="18183-3" role="funder">National Endowment for the Humanities</corpName>
</respStmt>
```

Listing 48.

### 3.4.1.4 Series Statement

The `<seriesStmt>` element is the fifth component of the `<fileDesc>` element and is optional.

**<seriesStmt>** Groups information about the series, if any, to which a publication belongs.

A series may be defined in one of the following ways:

- A group of separate items related to one another by the fact that each item bears, in addition to its own title proper, a collective title applying to the group as a whole. The individual items may or may not be numbered.
- Each of two or more volumes of essays, lectures, articles, or other items, similar in character and issued in sequence.
- A separately numbered sequence of volumes within a series or serial.

The `<seriesStmt>` element may contain one or more of the following more specific elements:

**<contents>** List of the material contained within a resource.

**<editor>** The name of the individual(s), institution(s) or organization(s) acting in an editorial capacity.

**<identifier>** An alpha-numeric string that establishes the identity of the described material.

**<respStmt>** Transcription of text that names one or more individuals, groups, or in rare cases, mechanical processes, responsible for creation, realization, production, funding, or distribution of the intellectual or artistic content.

**<seriesStmt>** Groups information about the series, if any, to which a publication belongs.

**<title>** Title of a bibliographic entity.

The `<title>`, `<editor>` and `<identifier>` elements have the same function described above: identification of the item, in this case the series, and the individuals or groups responsible for its creation. The `<title>` element is required within `<seriesStmt>`.

---

```
<seriesStmt>
  <title>MEI Sample Collection</title>
</seriesStmt>
```

Listing 49.

---

The `<identifier>` element may be used to supply any identifying number associated with the series, including both standard numbers such as an ISSN and particular issue numbers. Its type attribute is used to categorize the number further, taking the value 'ISSN' for an ISSN, for example.

---

```
<seriesStmt>
  <title level="s">Studies in Ornamentation</title>
  <editor>Jacques Composeur</editor>
  <identifier type="ISSN">0-345-6789</identifier>
</seriesStmt>
```

#### Listing 50.

The contents of the series may be enumerated using the `<contents>` element. Use of this element should be determined by the complexity of the resource and whether or not the information is readily available. The `<contents>` element may consist of a single paragraph when unstructured information is sufficient.

```
<contents>
  <p>On Wenlock Edge -- From Far, From Eve and Morning -- Is My Team Ploughing? -- Oh, When I
  Was In Love With You -- Bredon Hill -- Clun </p>
</contents>
```

#### Listing 51.

Alternatively, `<contentItem>` elements may be used to provide structure for the content description.

```
<contents>
  <head>Contents</head>
  <contentItem>On Wenlock Edge</contentItem>
  <contentItem>From Far, From Eve and Morning</contentItem>
  <contentItem>Is My Team Ploughing?</contentItem>
  <contentItem>Oh, When I Was In Love With You</contentItem>
  <contentItem>Bredon Hill</contentItem>
  <contentItem>Clun</contentItem>
</contents>
```

#### Listing 52.

Finally, using the target attribute, a link to an external table of contents may be supplied in lieu of or in addition to the child elements of `<contents>`.

```
<contents target="http://www.series.content/12345"/>
```

#### Listing 53.

The `<seriesStmt>` element is allowed to nest within itself in order to accommodate a series within a series.

### 3.4.1.5 Notes Statement

The [`<notesStmt>`](#) element is the sixth component of the [`<fileDesc>`](#) element and is optional. If used, it contains one or more [`<annot>`](#) elements, each containing a single piece of descriptive information of the kind treated as 'general notes' in traditional bibliographic descriptions.

**[`<notesStmt>`](#) (notes statement)**– Collects any notes providing information about a text additional to that recorded in other parts of the bibliographic description.

Some information found in the notes area in conventional bibliography has been assigned specific elements in these Guidelines; in particular the following items should be tagged as indicated, rather than as general notes:

- the nature, scope, artistic form, or purpose of the work; also the genre or other intellectual category to which it may belong. These should be formally described within the [`workList`](#) element (section [3.6 Work Description](#)).
- bibliographic details relating to the source or sources of an electronic text: e.g., 'Transcribed from a facsimile of the 1743 publication'. These should be formally described in the [`sourceDesc`](#) element (section [3.4.1.6 Source Description](#)).
- further information relating to publication, distribution, or release of the text, including sources from which the text may be obtained, any restrictions on its use or formal terms on its availability. These should be placed in the appropriate division of the [`pubStmt`](#) element (section [3.4.1.3 Publication, Distribution, etc.](#)).
- publicly documented numbers associated *with the file* should be placed in an [`altId`](#) element within the [`meiHead`](#) element. International Standard Serial Numbers (ISSN), International Standard Book Numbers (ISBN), and other internationally agreed upon standard numbers that uniquely identify an item, should be treated in the same way, rather than as specialized bibliographic notes. As described elsewhere, identifiers *for sources of the file* should be recorded within the [`sourceDesc`](#).

Nevertheless, the [`<notesStmt>`](#) element may be used to record potentially significant details about the file and its features, for example:

- dates, when they are relevant to the content or condition of the computer file: e.g., 'manual dated 2010', 'file validated Apr 2011'
- names of persons or bodies connected with the technical production, administration, or consulting functions of the effort which produced the file, if these are not named in statements of responsibility in the title or edition statements of the file description: e.g., 'Historical commentary provided by members of the Big Symphony Orchestra'
- availability of the file in an additional medium or information not already recorded about the availability of documentation: e.g., 'User manual is loose-leaf in eleven paginated sections'
- language of work and abstract, if not encoded in the [`langUsage`](#) element, e.g., 'Text in English with stage directions in French and German'

Each such item of information may be tagged using the general-purpose `<annot>` element. Groups of annotations are contained within the `<notesStmt>` element, as in the following example:

```
<notesStmt>
  <annot>Historical commentary provided by John Smith.</annot>
  <annot>OCR scanning performed at University of Virginia.</annot>
</notesStmt>
```

Listing 54.

There are advantages, however, to encoding such information with more precise elements elsewhere in the MEI header, when such elements are available. For example, the notes above might be encoded as follows:

```
<titleStmt>
  <title>...</title>
  <respStmt>
    <persName>John Smith</persName>
    <resp>historical commentary</resp>
  </respStmt>
  <respStmt>
    <corpName>University of Virginia</corpName>
    <resp>OCR scanning</resp>
  </respStmt>
</titleStmt>
```

Listing 55.

### 3.4.1.6 Source Description

The `<sourceDesc>` element is the seventh and final component of the `<fileDesc>` element. In MEI, `<sourceDesc>` is a grouping element containing one or more `<source>` elements, each of which records details of a source from which the computer file is derived. This might be a printed text or manuscript, another computer file, an audio or video recording, or a combination of these. An electronic file may also have no source, if what is being cataloged is an original text created in electronic form.

**<sourceDesc>** A container for the descriptions of the source(s) used in the creation of the electronic file.

**<source>** A bibliographic description of a source used in the creation of the electronic file.

The `<source>` element may contain

**<head>** Contains any heading, for example, the title of a section of text, or the heading of a list.

**<locusGrp>** Groups locations which together form a distinct but discontinuous item within a manuscript or manuscript part, according to a specific foliation.

**<locus>** Defines a location within a manuscript or manuscript component, usually as a (possibly discontinuous) sequence of folio references.

**<bib>** Provides a loosely-structured bibliographic citation in which the sub-components may or may not be explicitly marked.

**<bibStruct>** Contains a bibliographic citation in which bibliographic sub-elements must appear in a specified order.

### 3.4.1.6.1 Associating Metadata and Data

In the MEI header, the data attribute may be used to associate metadata with related notational elements.

Similarly, in the body of the MEI document, the decls attribute may be used to associate parts of the encoded text with related metadata.

The most useful associations of this type are between the bibliographic description of a source and the material taken from it.

## 3.4.2 Encoding Description

The **<encodingDesc>** element is the second major subdivision of the MEI header. It specifies the methods and editorial principles which governed the transcription or encoding of the source material. Though not formally required, its use is highly recommended.

**<encodingDesc>** Documents the relationship between an electronic file and the source or sources from which it was derived as well as applications used in the encoding/editing process.

The encoding description may contain elements taken from the model.encodingPart class. By default, this class makes available the following elements:

**<appInfo>** Groups information about applications which have acted upon the MEI file.

**<editorialDecl>** Used to provide details of editorial principles and practices applied during the encoding of musical text.

**<projectDesc>** Project-level meta-data describing the aim or purpose for which the electronic file was encoded, funding agencies, etc. together with any other relevant information concerning the process by which it was assembled or collected.

**<samplingDecl>** Contains a prose description of the rationale and methods used in sampling texts in the creation of a corpus or collection.

**<domainsDecl>** Indicates which domains are included in the encoding.

**<tagsDecl>** Provides detailed information about the tagging applied to a document.

**<classDecls>** Groups information which describes the nature or topic of an entity.

Each of these elements is further described in the appropriate section below.

### 3.4.2.1 Application Information

It is sometimes convenient to store information relating to the processing of an encoded resource within its header. Typical uses for such information might be:

- to allow an application to discover that it has previously opened or edited a file, and what version of itself was used to do that;
- to show (through a date) which application last edited the file to allow for diagnosis of any problems that might have been caused by that application;
- to allow users to discover information about an application used to edit the file
- to allow the application to declare an interest in elements of the file which it has edited, so that other applications or human editors may be more wary of making changes to those sections of the file.

**<application>** Provides information about an application which has acted upon the current document.

version ( <a href="#">&lt;application&gt;</a> )	Supplies a version number for an application, independent of its identifier or display name.
----------------------------------------------------	----------------------------------------------------------------------------------------------

Each [<application>](#) element identifies the current state of one software application with regard to the current file. This element is a member of the att.datable class, which provides a variety of attributes for associating this state with a date and time, or a temporal range. The xml:id and version attributes should be used to uniquely identify the application and its major version number (for example, 'Music Markup Tool 1.5'). It is not intended that a software application should add a new [<application>](#) element each time it touches the file.

The following example shows how these elements might be used to record the fact that version 1.5 of an application called 'Music Markup Tool' has an interest in two parts of a document. The parts concerned are accessible at the URLs given as targets of the two [<ptr>](#) elements. When used on [<application>](#), the date attribute specifies when the application was employed, in this case June 6, 2011. Version information for the application should be placed in version.

```
<appInfo>
  <application isodate="2011-06-06" version="1.5" xml:id="header.MusicMarkupTool">
    <name>Music Markup Tool</name>
    <ptr target="#header.P1"/>
    <ptr target="#header.P2"/>
  </application>
</appInfo>
```

Listing 56.

### 3.4.2.2 Declaration of Editorial Principles

The [<editorialDecl>](#) element is used to provide details of the editorial practices applied during the encoding of a musical text.

It may contain a prose description only, or one or more of a set of specialized elements; that is, members of the MEI model.editorialDeclPart class.

Some of these policy elements carry attributes to support automated processing of certain well-defined editorial decisions; all of them contain a prose description of the editorial principles adopted with respect to the particular feature concerned. Examples of the kinds of questions which these descriptions are intended to answer are given in the list below.

<b>correction</b>	States how and under what circumstances corrections have been made in the text. corlevelIndicates the degree of correction applied to the text. methodIndicates the method employed to mark corrections and normalizations. Was the text corrected during or after data capture? If so, were corrections made silently or are they marked using the tags described in chapter 11 Editorial Markup? What principles have been adopted with respect to omissions, truncations, dubious corrections, alternate readings, false starts, repetitions, etc.?
<b>interpretation</b>	Describes the scope of any analytic or interpretive information added to the transcription of the music. Has any analytic or ‘interpretive’ information been provided — that is, information which is felt to be non-obvious, or potentially contentious? If so, how was it generated? How was it encoded?
<b>normalization</b>	Indicates the extent of normalization or regularization of the original source carried out in converting it to electronic form. methodIndicates the method employed to mark corrections and normalizations. Was the text normalized, for example by regularizing any non-standard enharmonic spellings, etc.? If so, were normalizations performed silently or are they marked using the tags described in chapter 11 Editorial Markup ? What authority was used for the regularization? Also, what principles were used when normalizing numbers to provide the standard values for the value attribute described in section 1.3.4 Names, Dates, Numbers, Abbreviations, and Addresses and what format is used for them?
<b>segmentation</b>	Describes the principles according to which the musical text has been segmented, for example into movements, sections, etc. How is the musical text segmented? If mdiv and/or section elements have been used to partition the music for analysis, how are they marked and how was the segmentation arrived at?
<b>stdVals (standard values)</b>	Specifies the format used when standardized date or number values are supplied. In most cases, attributes bearing standardized values should conform to a defineddatatype. In cases where this is not appropriate, this element may be used to describe the standardization methods underlying the values supplied.

Experience shows that a full record should be kept of decisions relating to editorial principles and encoding practice, both for future users of the text and for the project which produced the text in the first instance. Any information about the editorial principles applied not falling under one of the above headings may be recorded as additional prose following the special-use elements.

```

<editorialDecl>
  <segmentation>
    <p>Separate mdiv elements have been created for each movement of the work.</p>
  </segmentation>
  <interpretation>
    <p>The harmonic analysis applied throughout movement 1 was added by hand and has not been checked. </p>
  </interpretation>
  <correction>
    <p>Errors in transcription controlled by using the Finale editor.</p>
  </correction>
  <normalization>
    <p>All sung text converted to Modern American spelling following Webster's 9th Collegiate dictionary. </p>
  </normalization>
  <p>
    <!-- Other editorial practices described here. -->
  </p>
</editorialDecl>

```

Listing 57.

An editorial practices declaration which applies to more than one text or division of a text need not be repeated in the header of each text or division. Instead, the decls attribute of each text (or subdivision of the text) to which it applies may be used to supply a cross-reference to a single declaration encoded in the header.

### 3.4.2.3 Project Description

**<projectDesc>** Project-level meta-data describing the aim or purpose for which the electronic file was encoded, funding agencies, etc. together with any other relevant information concerning the process by which it was assembled or collected.

The **<projectDesc>** element may be used to describe, in prose, the purpose for which a digital resource was created, together with any other relevant information concerning the process by which it was assembled or collected. This is of particular importance for corpora or miscellaneous collections, but may be of use for any text, for example to explain why one kind of encoding practice has been followed rather than another.

For example:

```

<encodingDesc>
  <projectDesc>
    <p>Texts collected for use in the MEI Summer Workshop, Aug. 2012.</p>
  </projectDesc>
</encodingDesc>

```

---

Listing 58.

---

### 3.4.2.4 Sampling Declaration

The samplingDecl element holds a prose description of the rationale and methods used in selecting texts, or parts of text, for inclusion in the resource.

**<samplingDecl>** Contains a prose description of the rationale and methods used in sampling texts in the creation of a corpus or collection.

The **<samplingDecl>** element should include information about such matters as:

- the size of individual samples
  - the method or methods by which they were selected
  - the underlying population being sampled
  - the object of the sampling procedure used but is not restricted to these.
- 

```
<samplingDecl>
  <p>Encoding contains 40 randomly-selected measures.</p>
</samplingDecl>
```

---

Listing 59.

---

It may also include a simple description of any parts of the source text included or excluded:

---

```
<samplingDecl>
  <p>Only the songs have been transcribed. Advertisements have been silently omitted. All
  mathematical expressions have been omitted, and their place marked with a
    <gi scheme="MEI">gap</gi>
  element. </p>
</samplingDecl>
```

---

Listing 60.

---

```
<samplingDecl>
  <p>Only the first 6 measures of movement 1 are encoded.</p>
</samplingDecl>
```

---

Listing 61.

---

A sampling declaration which applies to more than one text or division of a text need not be repeated in the header of each such text. Instead, the decls attribute of each text (or subdivision of the text) to which the sampling declaration applies may be used to supply a cross-reference to it, as further described in section [3.4.1.6.1 Associating Metadata and Data](#).

### 3.4.2.5 Class Declarations

The `<classDecls>` element allows the declaration of generic taxonomies for the classification of entities according to one or both of the following two methods:

- by reference to a recognized international classification scheme such as the Dewey Decimal Classification, the Universal Decimal Classification, the Colon Classification, the Library of Congress Classification, or any other system widely used in library and documentation work
- by providing a set of keywords, as provided, for example, by British Library or Library of Congress Cataloguing in Publication data, or as defined by the encoder.

**<classDecls>** Groups information which describes the nature or topic of an entity.

Each taxonomy may have a heading and may declare any number of categories using the `<category>` element. Categories may be declared by reference to existing vocabularies or simply explained by a descriptive text.

```
<classDecls>
  <taxonomy>
    <head>Subject categories</head>
    <category xml:id="header.LoC_lcco">
      <desc>Library of Congress subject headings. Prepared by the Cataloging Policy and Support Office, Collections Services. Washington, D.C.: Library of Congress, Cataloging Distribution Service, 1993-. </desc>
    </category>
  </taxonomy>
</classDecls>
```

Listing 62.

The `<category>` element may or may not include a bibliographic citation and/or a URI at which the classification scheme or information about it may be found.

```
<taxonomy>
  <category auth.uri="http://www.loc.gov" auth="Library of Congress" xml:id="header.LCSH"/>
  <category auth.uri="http://www.loc.gov/aba/cataloging/classification/lcco/lcco_m.pdf"
  xml:id="header.LoC_lcco">
```

```
<desc>Library of Congress subject headings. Prepared by the Cataloging Policy and Support  
Office, Collections Services. Washington, D.C.: Library of Congress, Cataloging Distribution  
Service, 1993- .</desc>  
</category>  
</taxonomy>
```

---

### Listing 63.

---

The categories declared in the taxonomies may then be referenced to within [classification](#) by means of the class attribute as described in the [3.6.12 Classification](#) section.

### 3.4.3 Revision Description

The final sub-element of the MEI header, the [revisionDesc](#) element, provides a detailed change log in which each change made to a text may be recorded. Its use is optional but highly recommended. It provides essential information for the administration of large numbers of files which are being updated, corrected, or otherwise modified as well as extremely useful documentation for files being passed from researcher to researcher or system to system. Without change logs, it is easy to confuse different versions of a file, or to remain unaware of small but important changes made in the file by some earlier link in the chain of distribution. No change should be made in any MEI-conformant file without corresponding entries being made in the change log.

**<revisionDesc>** Container for information about alterations that have been made to an MEI file.

**<change>** Individual change within the revision description.

The main purpose of the revision description is to record changes in the text to which a header is prefixed. However, it is recommended practice to include entries also for significant changes in the header itself (other than the revision description itself, of course). At the very least, an entry should be supplied indicating the date of creation of the header.

The log consists of a list of [change](#) elements, each of which contains a detailed description of the changes made. If a number is to be associated with one or more changes (for example, a revision number), the n attribute may be used to indicate it. The person responsible for the change and the date of the change may be indicated by the [respStmt](#) and [date](#) elements. The description of the change itself is contained within the [changeDesc](#) element, which can hold one or more paragraphs.

It is recommended to give changes in reverse chronological order, most recent first.

For example:

---

```
<revisionDesc>  
<change n="4">  
  <respStmt>  
    <persName>KR</persName>
```

```
</respStmt>
<changeDesc>
  <p>Cleaned up MEI file automatically using Header.xsl.</p>
</changeDesc>
<date isodate="2011-12-01"/>
</change>
<change n="3">
  <respStmt>
    <persName>KR</persName>
  </respStmt>
  <changeDesc>
    <p>Cleaned up MEI file automatically using ppq.xsl.</p>
  </changeDesc>
  <date isodate="2011-10-21"/>
</change>
</revisionDesc>
```

Listing 64.

A slightly shorter form for recording changes is also available when the date of the change can be described by a single date in a standard ISO form and when the name of the agent(s) responsible for the change, encoded elsewhere in the header, can be referred to by one or more URLs given in the resp attribute. For example:

```
<change isodate="2011-10-21" n="3" resp="#KR #MH">
  <changeDesc>
    <p>Cleaned up MEI file automatically using ppq.xsl.</p>
  </changeDesc>
</change>
```

Listing 65.

## 3.5 Functional Requirements for Bibliographic Records (FRBR)

MEI header information may refer to different levels of description of the encoded work: Some information may apply the work in all its various forms and realizations, e.g., the name of its composer. Other information may describe a certain version of the work, or a source such as the printed first edition, or only a single copy of that source. Core MEI limits the header information to two such levels of description: work and source, respectively.

However, when the FRBR module is available more detailed descriptions are possible. With certain limitations, mainly due to the musical nature of the works encoded in MEI, the FRBR module adapts the [Functional Requirements for Bibliographic Records \(FRBR\)](#) as recommended by the International Federation of Library Associations and Institutions (IFLA).

The IFLA's FRBR model distinguishes four levels of abstraction, or entities:

**Work** FRBR defines a work as a "distinct intellectual or artistic creation", an abstract entity because there is no single material object one can point to as the work.

**Expression** An expression is defined as "the intellectual or artistic realization of a work in the form of [...] notation, sound, image, object, movement, etc., or any combination of such forms". Expressions are also abstract entities.

**Manifestation** A manifestation is defined as "the physical embodiment of an expression of a work", including, for instance, manuscripts, books, sound recordings, films, video recordings, CD-ROMs, multimedia kits, etc. The manifestation represents all the physical objects that bear the same characteristics, with respect to both intellectual content and physical form.

**Item** A single exemplar of a manifestation is called an item, e.g., a specific copy of a printed score. With manuscripts, item and manifestation levels are nearly identical. A manuscript may be regarded as a manifestation having only one item.

### 3.5.1 FRBR Entities in MEI

With the FRBR module, MEI offers four elements corresponding to the FRBR "Group 1" entities:

**<work>** Provides a detailed description of a work — a distinct intellectual or artistic creation — specifically its history, language use, and high-level musical attributes (e.g., key, tempo, meter, medium of performance, and intended duration).

**<expression>** Intellectual or artistic realization of a work.

**<manifestation>** A bibliographic description of a physical embodiment of an expression of a work.

**<item>** Single instance or exemplar of a source/manifestation.

The names of the MEI entities follow those of FRBR: the **<work>** element is a container for description at the FRBR "work" level, **<expression>** is for description at the FRBR "expression" level, **<manifestation>** contains "manifestation" level description, and **<item>** holds FRBR "item" level description. Please note: Until MEI 3.0.0, the **<source>** element in **<sourceDesc>** was used for manifestation-level descriptions.

The `<work>` element has an optional child element to hold the expression elements:

**<expressionList>** Gathers bibliographic expression entities.

As `<expressionList>` is a container element for descriptions of different expressions of the same work, it may contain only

`<expression>` elements.

The content model of `<expression>` is similar to that of `<work>`. It does not, however, permit `<expressionList>` and `<audience>` elements. But it adds elements that aid identification and description of specific versions of a work:

**<extent>** Used to express size in terms other than physical dimensions, such as number of pages, records, bytes, physical components, etc.

**<scoreFormat>** Describes the type of score used to represent a musical composition (e.g., short score, full score, condensed score, close score, etc.).

Since expressions, like works, are abstractions, their titles are often nebulous. Usually, however, the title of an expression is the same as the work it represents. When the relationship between a work and an expression is encoded hierarchically, the expression's title element may be omitted with the assumption that it will be inherited from the work. If no title is provided for an expression, distinguishing characteristics must be provided in other elements, such as `<perfMedium>`, as in the following example:

```

<work>
  <title>Pavane pour une infante défunte</title>
  <expressionList>
    <expression>
      <title/>
      <perfMedium>
        <perfResList>
          <perfRes>piano</perfRes>
        </perfResList>
      </perfMedium>
    </expression>
    <expression>
      <title/>
      <perfMedium>
        <perfResList>
          <perfRes>orchestra</perfRes>
        </perfResList>
      </perfMedium>
    </expression>
  </expressionList>
</work>

```

Listing 66.

Programmatic concatenation of the work title and one or more characteristics of the expression can be used to provide identification for the expression. For example, the expressions above may be identified by "Pavane pour une infante défunte (piano)" and "Pavane pour une infante défunte (orchestra)". In some cases, it may be helpful to assign a descriptive title to the expression, as illustrated below. The carrier of the manifestation is often a good source of this kind of descriptive text.

```
<work>
  <title>Pavane pour une infante défunte</title>
  <expressionList>
    <expression>
      <title>Version for piano</title>
      <perfMedium>
        <perfResList>
          <perfRes>piano</perfRes>
        </perfResList>
      </perfMedium>
    </expression>
    <expression>
      <title>Version for orchestra</title>
      <perfMedium>
        <perfResList>
          <perfRes>orchestra</perfRes>
        </perfResList>
      </perfMedium>
    </expression>
  </expressionList>
</work>
```

Listing 67.

---

```
<work>
  <title>Sonata No. 2</title>
  <expressionList>
    <expression>
      <title>Live recording at Carnegie Hall</title>
    </expression>
    <expression>
      <title>Studio recording</title>
    </expression>
  </expressionList>
</work>
```

Listing 68.

---

The [manifestationList](#) and [manifestation](#) elements are discussed in section 3.7 Encoding Sources in MEI.

The `<itemList>` element provides functionality similar to that of `<expressionList>`; that is, it can be used to group descriptions of individual items (exemplars) of the parent source. Just like `<expressionList>`, which can only hold `<expression>` sub-components, `<itemList>` may only contain `<item>` elements.

**<itemList>** Gathers bibliographic item entities.

**<item>** Single instance or exemplar of a source/manifestation.

```

<manifestation>
  <titleStmt>
    <title>Trois trios pour le piano-forte violon, et violoncelle</title>
  </titleStmt>
  <itemList>
    <item label="Copy at Stanford">
      <physLoc>
        <repository>
          <corpName>Stanford University Library</corpName>
        </repository>
      </physLoc>
    </item>
    <item label="Copy at Dresden">
      <physLoc>
        <repository>
          <corpName>Dresden, Sächsische Landesbibliothek – Staats- und
          Universitätsbibliothek</corpName>
        </repository>
      </physLoc>
    </item>
  </itemList>
</manifestation>

```

Listing 69.

### 3.5.2 Component Parts in FRBR

Each of the four MEI elements corresponding to FRBR entities may contain a list of constituent parts. All four entities utilize the same element:

**<componentList>** Container for intellectual or physical component parts of a bibliographic entity.

However, the child elements of a component group must be the same type as the group's parent. This allows for a more detailed description than is possible using the core MEI `<contents>` element. For example, a work element's `<componentList>` element can only contain `<work>` elements, etc. In this way, the `<componentList>` element may be employed to describe composite works, as in the example below:

```
<work>
  <title>Der Ring des Nibelungen</title>
  <componentList>
    <work>
      <title>Das Rheingold</title>
    </work>
    <work>
      <title>Die Walküre</title>
    </work>
    <work>
      <title>Siegfried</title>
    </work>
    <work>
      <title>Götterdämmerung</title>
    </work>
  </componentList>
</work>
```

---

Listing 70.

This technique can also be applied when a single intellectual source is comprised of multiple physical parts. In the following example, the choral parts were published in four physically separate "signatures":

---

```
<manifestation xml:id="source.printed_choral_parts">
  <titleStmt>
    <title>Printed choral parts</title>
  </titleStmt>
  <pubStmt>
    <publisher>Horneman & Erslev</publisher>
    <pubPlace>Copenhagen</pubPlace>
    <date isodate="1871">1871</date>
  </pubStmt>
  <componentList>
    <manifestation>
      <titleStmt>
        <title>Soprani</title>
      </titleStmt>
      <physDesc>
        <extent unit="pages">4</extent>
      </physDesc>
    </manifestation>
    <manifestation>
      <titleStmt>
        <title>Alti</title>
      </titleStmt>
      <physDesc>
        <extent unit="pages">4</extent>
      </physDesc>
    </manifestation>
  </componentList>
</manifestation>
```

```

</physDesc>
</manifestation>
<manifestation>
  <titleStmt>
    <title>Tenori</title>
  </titleStmt>
  <physDesc>
    <extent unit="pages">6</extent>
  </physDesc>
</manifestation>
<manifestation>
  <titleStmt>
    <title>Bassi</title>
  </titleStmt>
  <physDesc>
    <extent unit="pages">6</extent>
  </physDesc>
</manifestation>
</componentList>
</manifestation>

```

Listing 71.

### 3.5.3 FRBR Relationships

FRBR defines a number of terms that describe how the basic entities relate to each other. MEI provides the following elements for this purpose.

**<relationList>** Gathers relation elements.

**<relation>** Describes a relationship or linkage amongst entities.

rel (**<relation>**) Describes the relationship between the entities identified by the plist and target attributes.

Each of the four FRBR entity equivalents – the work, expression, source, and item elements – allows a list of such relationship descriptions as its last child element. **<relationList>** provides a container for individual **<relation>** elements. The nature of the relationship must be specified by the rel attribute and the target of the relationship must be identified by the target attribute. The values allowed by rel follow those defined for FRBR at [http://www.ifla.org/files/assets/cataloguing/frbr/frbr\\_2008.pdf](http://www.ifla.org/files/assets/cataloguing/frbr/frbr_2008.pdf).

Since relations are bidirectional, they may be defined on both entities involved, using pairs of oppositely-directed relation descriptors. The following FRBR relations are allowed in MEI as values of the relation element's rel attribute (shown in pairs for clarity):

- hasAbridgement / isAbridgementOf
- hasAdaptation / isAdaptationOf
- hasAlternate / isAlternateOf

- hasArrangement / isArrangementOf
- hasComplement / isComplementOf
- hasEmbodiment / isEmbodimentOf
- hasExemplar / isExemplarOf
- hasImitation / isImitationOf
- hasPart / isPartOf
- hasRealization / isRealizationOf
- hasReconfiguration / isReconfigurationOf
- hasReproduction / isReproductionOf
- hasRevision / isRevisionOf
- hasSuccessor / isSuccessorOf
- hasSummarization / isSummarizationOf
- hasSupplement / isSupplementOf
- hasTransformation / isTransformationOf
- hasTranslation / isTranslationOf

Some of these relationships are already implicitly expressed by the MEI structural model: FRBR defines an expression entity as a realization of a work, but as this relation is implied by the expressionList element's child relationship to its parent work element, the hasRealization/isRealizationOf relation does not need to be explicitly declared. Likewise, it is not necessary to specify by means of relation elements that an item is an exemplar of the source described by its parent source element. This resembles the FRBR model, which allows 1:n relationships both between works and expressions, and between manifestations and items.

However, as FRBR allows n:n relations between expressions and manifestations (in MEI: sources), a hierarchical model based on the structure of XML is clearly insufficient to express all possible expression / manifestation combinations. It is therefore required to declare these relations explicitly. In FRBR terms, a manifestation / source is an embodiment of an expression.

---

```
<manifestation>
  <titleStmt>
    <title>Score, first edition</title>
  </titleStmt>
  <relationList>
    <relation rel="isEmbodimentOf" target="#version_for_orchestra"/>
  </relationList>
</manifestation>
```

---

Listing 72.

---

Within the `<componentList>` element, the order of child elements implicitly describes a hasSuccessor/isSuccessorOf relationship between components, i.e., it defines a certain sequence such as the movements of a work. In other cases, `<relation>` elements may be needed to explicitly encode relationships not otherwise defined by encoding order or hierarchy. For instance, the hasReproduction/isReproductionOf relationship may be used to indicate that one source is a reprint of another.

```
<manifestation>
  <pubStmt>
    <publisher>Horneman & Erslev</publisher>
    <pubPlace>Copenhagen</pubPlace>
    <date isodate="1874">1874</date>
  </pubStmt>
  <relationList>
    <relation rel="isReproductionOf" target="#source.printed_choral_parts"/>
  </relationList>
</manifestation>
```

Listing 73.

Moreover, the use of `<componentList>` implicitly defines a hasPart/isPartOf relationship between the componentList element's parent and its child elements. Using the `<relationList>` and relation elements to define their relationship, the four component works in the "Der Ring des Nibelungen" example above could alternatively be encoded as sibling work elements to the "Ring" work element.

```
<workList>
  <work xml:id="theRing">
    <title>Der Ring des Nibelungen</title>
    <relationList>
      <relation rel="hasPart" target="#rheingold"/>
      <relation rel="hasPart" target="#walkuere"/>
      <relation rel="hasPart" target="#siegfried"/>
      <relation rel="hasPart" target="#goetterdaemmerung"/>
    </relationList>
  </work>
  <work xml:id="rheingold">
    <title>Das Rheingold</title>
    <relationList>
      <relation rel="isPartOf" target="#theRing"/>
    </relationList>
  </work>
  <work xml:id="walkuere">
    <title>Die Walküre</title>
    <relationList>
      <relation rel="isPartOf" target="#theRing"/>
    </relationList>
  </work>
```

```
<work xml:id="siegfried">
  <title>Siegfried</title>
  <relationList>
    <relation rel="isPartOf" target="#theRing"/>
  </relationList>
</work>
<work xml:id="goetterdaemmerung">
  <title>Götterdämmerung</title>
  <relationList>
    <relation rel="isPartOf" target="#theRing"/>
  </relationList>
</work>
</workList>
```

Listing 74.

Relations may also be used to point to external resources. For instance, each of the individual component works of the "Ring" could be encoded in separate files, with relations pointing to them.

In the file "ring.xml":

---

```
<workList>
  <work>
    <title>Der Ring des Nibelungen</title>
    <relationList>
      <relation rel="hasPart" target="rheingold.xml"/>
      <relation rel="hasPart" target="walkuere.xml"/>
      <relation rel="hasPart" target="siegfried.xml"/>
      <relation rel="hasPart" target="goetterdaemmerung.xml"/>
    </relationList>
  </work>
</workList>
```

Listing 75.

In the file "rheingold.xml":

---

```
<workList>
  <work>
    <title>Das Rheingold</title>
    <relationList>
      <relation rel="isPartOf" target="ring.xml"/>
    </relationList>
  </work>
```

```
</workList>
```

Listing 76.

### 3.5.4 RelatedItem vs. FRBR

MEI offers two related concepts for capturing relations between bibliographic items. The model of [`<relatedItem>`](#), as described in chapter [9.2.12.1 Related Items](#) of these Guidelines, is derived from MODS v3.4 (see documentation [here](#)). Its purpose in MEI is to encode bibliographic references between mostly "secondary" material, like reviews, articles, and so on. It may be used to provide cross-references between information encoded in different places of the header.

However, [`<relatedItem>`](#) is less ideal for describing the relations between works, differing versions of these works, the sources in which those versions are transmitted, and where applicable the individual copies of a print. For these situations, it is strongly recommended to use the [3.5 Functional Requirements for Bibliographic Records \(FRBR\)](#) instead. This module is based on the Functional Requirements for Bibliographic Records, as specified by the IFLA. It allows a much finer description of relationships between such "primary" entities. For compatibility reasons, both models should not be confused or mixed under any circumstances.

## 3.6 Work Description

The `<workList>` element is the third major subdivision of the MEI Header. It is an optional element, the purpose of which is to enable the recording of information characterizing various descriptive aspects of the abstract work.

**<workList>** Grouping mechanism for information describing non-bibliographic aspects of a text.

Within `<workList>`, the `<work>` element is used to hold information for each resource being described.

**<work>** Provides a detailed description of a work — a distinct intellectual or artistic creation — specifically its history, language use, and high-level musical attributes (e.g., key, tempo, meter, medium of performance, and intended duration).

All the components of `<work>` are optional, but they must occur in the following order:

- `identifier`
- `title`
- Responsibility-like elements including `composer`, `lyricist`, `contributor` and others
- `incip`
- `key`
- `mensuration`
- `meter`
- `tempo`
- `otherChar`
- `history`
- `langUsage`
- `perfMedium`
- `audience`
- `contents`
- `context`
- `biblList`
- `notesStmt`
- `classification`

### 3.6.1 Work Identification

The following elements provide minimal identifying information for the intellectual work:

**<identifier>** An alpha-numeric string that establishes the identity of the described material.

**<title>** Title of a bibliographic entity.

**<arranger>** A person or organization who transcribes a musical composition, usually for a different medium from that of the original; in an arrangement the musical substance remains essentially unchanged.

**<author>** The name of the creator of the intellectual content of a non-musical, literary work.

**<composer>** The name of the creator of the intellectual content of a musical work.

**<contributor>** Names of individuals, institutions, or organizations responsible for contributions to the intellectual content of a work, where the specialized elements for authors, editors, etc. do not suffice or do not apply.

**<editor>** The name of the individual(s), institution(s) or organization(s) acting in an editorial capacity.

**<funder>** Names of individuals, institutions, or organizations responsible for funding. Funders provide financial support for a project; they are distinct from sponsors, who provide intellectual support and authority.

**<librettist>** Person or organization who is a writer of the text of an opera, oratorio, etc.

**<lyricist>** Person or organization who is a writer of the text of a song.

**<sponsor>** Names of sponsoring individuals, organizations or institutions. Sponsors give their intellectual authority to a project; they are to be distinguished from funders, who provide the funding but do not necessarily take intellectual responsibility.

The identifier and title values recorded here may or may not be the same as those assigned to published versions of the work. Fuller details are available in section [3.3.1 Title Statement](#).

### 3.6.2 Incipits

**<incip>** The opening music and/or words of a musical or textual work.

The first few notes and/or words of a piece of music are often used for identification purposes, especially when the piece has only a generic title, such as "Sonata no. 3". They appear in catalogs of music and in tables of contents of printed music that include multiple works.

The following elements are provided for the inclusion of incipits:

**<incip>** The opening music and/or words of a musical or textual work.

**<incipCode>** Incipit coded in a non-XML, plain text format, such as Plaine & Easie Code.

**<incipText>** Opening words of a musical composition.

The elements **<incipCode>** and **<incipText>** are available for the inclusion of coded incipits of music notation and textual incipits, respectively. The **<incipText>** element should contain only the initial performed text of the work, while **<incipCode>** may contain both words and music, depending on the capabilities of the scheme used to encode it. When both music and text are provided in **<incipCode>**, it may be helpful to repeat the text in **<incipText>** in order to provide easier access to only the text, for example, for indexing of the text without having to extract it from the coded incipit.

Both **<incipCode>** and **<incipText>** allow reference to an external file location via the target attribute and specification of the internet media type of the external file via the mimetype attribute.

An MEI-encoded incipit may be captured in a [<score>](#) sub-element.

In addition, [<graphic>](#) may be used as a sub-element of [<incipit>](#) to include an image of an incipit.

To facilitate the capture of metadata associated with an incipit, MEI allows the following sub-elements within [<incipit>](#). The order of their presentation below follows the order in which they must appear in this context.

**<tempo>** Text and symbols descriptive of tempo, mood, or style, e.g., "allarg.", "a tempo", "cantabile", "Moderato", "J=60", "Moderato J =60").

**<role>** Name of a dramatic role, as given in a cast list.

**<clef>** Indication of the exact location of a particular note on the staff and, therefore, the other notes as well.

**<clefGrp>** A set of simultaneously-occurring clefs.

**<perfRes>** Name of an instrument on which a performer plays, a performer's voice range, or a standard performing ensemble designation.

**<perfResList>** Several instrumental or vocal resources treated as a group.

**<key>** Key captures information about tonal center and mode.

**<meter>** Captures information about the time signature within bibliographic descriptions.

**<mensuration>** Captures information about mensuration within bibliographic descriptions.

**<annot>** Provides a statement explaining the text or indicating the basis for an assertion.

Usually, the metadata captured in this manner is rendered alongside or in lieu of a coded or graphical incipit. It may or may not serve in a work identification capacity, depending on whether the incipit is intended to represent the entire work or a segment of the work. For example, if an incipit is provided for each aria in an opera, then the metadata pertains only to the aria, not the entire work.

### 3.6.3 Key, Tempo, and Meter

The attributes key, tempo, and meter are often helpful for identifying a musical work when it does not have a distinctive title.

**<key>** Key captures information about tonal center and mode.

**<mensuration>** Captures information about mensuration within bibliographic descriptions.

**<meter>** Captures information about the time signature within bibliographic descriptions.

**<tempo>** Text and symbols descriptive of tempo, mood, or style, e.g., "allarg.", "a tempo", "cantabile", "Moderato", "J=60", "Moderato J =60").

The [<key>](#) element is used exclusively within bibliographic descriptions. Do not confuse this element with [<keySig>](#), which is used within the body of an MEI file to record this data for musical notation. Likewise, [<meter>](#) should not be confused with the attributes used by staffDef and scoreDef to record meter-related data for notated music. The [<tempo>](#) element can be used here as well as in the body of an MEI document; however, its attributes other than xml:id, label, n, base, and lang are meaningless in the MEI header context, and therefore should

be avoided within a work description. The [<mensuration>](#) element is available for the description of works in the mensural repertoire. When a work uses meter and mensural signs, both [<mensuration>](#) and [<meter>](#) elements may be used.

### 3.6.4 Other Identifying Characteristics

Additional information that aids the identification of the work may be encoded using [<otherChar>](#).

**<otherChar>** Any characteristic that serves to differentiate a work or expression from another.

The following components provide detailed information about the work's context, including the circumstances of its creation, the languages used within it, high-level musical attributes, performing forces, etc.

### 3.6.5 Work History

The following elements are provided to capture the history of a musical work:

**<creation>** Non-bibliographic details of the creation of an intellectual entity, in narrative form, such as the date, place, and circumstances of its composition. More detailed information may be captured within the [history](#) element.

**<event>** Contains a free-text event description.

**<eventList>** Contains historical information given as a sequence of significant past events.

**<history>** Provides a container for information about the history of a resource other than the circumstances of its creation.

The [<creation>](#) element is intended to contain a brief, machine-processable statement of the circumstances of the work's creation. Its content is limited to text and the [<date>](#) and [<geogName>](#) elements.

The [<history>](#) element is a container for additional non-bibliographic details relating to a work. It may use the [<eventList>](#) element to provide a list of key events in the creation and performance history of the work. The [<eventList>](#) element is comprised of [<event>](#) elements containing a brief description of the associated event, including dates and locations where the event took place. An event list may use the type attribute to distinguish between multiple event lists with different functions, such as a list of events in the compositional process and a list of performance dates.

Event lists and other text components, such as paragraphs, tables, lists, and text divisions ([<div>](#)) may be interleaved when an 'essay-like' work history is desired.

The [<event>](#) element permits either a text-centric or a data-centric model. The text-centric model is provided for prose descriptions, while the data-centric model accommodates event descriptions that consist of a collection of descriptive phrases. In the text-centric model, paragraphs, tables, and lists may be used. In the data-centric model, however, only certain phrase-level elements, may appear.

### 3.6.6 Language Usage

The `<langUsage>` element is used within the `<workList>` element to describe the languages, sublanguages, dialects, etc. represented within a work. It contains one or more `<language>` elements, each of which provides information about a single language.

**<langUsage>** Groups elements describing the languages, sub-languages, dialects, etc., represented within the encoded resource.

**<language>** Description of a language used in the document.

A `<language>` element may be supplied for each different language used in a document. If used, its `xml:id` attribute should specify an appropriate language identifier. This is particularly important if extended language identifiers have been used as the value of `xml:lang` attributes elsewhere in the document.

Here is an example of the use of this element:

---

```
<langUsage>
  <language xml:id="fr-CA">Québécois</language>
  <language xml:id="en-CA">Canadian English</language>
  <language xml:id="en-GB">British English</language>
</langUsage>
<!-- Later in the document --&gt;
&lt;verse n="1" xml:lang="fr-CA"/&gt;
&lt;verse n="2" xml:lang="en-CA"/&gt;
&lt;verse n="3" xml:lang="en-GB"/&gt;</pre>
```

Listing 77.

---

### 3.6.7 Performance Medium

The following elements are available for description of a composition's performing forces:

**<castList>** Contains a single cast list or *dramatis personae*.

**<perfMedium>** Indicates the number and character of the performing forces used in a musical composition.

**<perfResList>** Several instrumental or vocal resources treated as a group.

The `<perfMedium>` element provides the possibility of describing a work in terms of its medium of performance; that is, the performing forces required. In the case of a dramatic work, the *dramatis personae* and associated voice qualities may be enumerated using `<castList>`. The `<perfResList>` element describes the necessary instrumental and vocal resources.

### 3.6.7.1 Cast Lists

A cast list is a specialized form of list, conventionally found at the start or end of a dramatic work, usually listing all the speaking/singing and non-speaking/singing roles in the play, often with additional description ('Cataplasm, a maker of Periwiggles and Attires') or the name of an actor or actress ('Old Lady Squeamish. Mrs Rutter').

**<castList>** Contains a single cast list or dramatis personae.

**<castGrp>** Groups one or more individual castItem elements within a cast list.

**<castItem>** Contains a single entry within a cast list, describing either a single role or a list of non-speaking roles.

Cast lists often function as identifying metadata and for this reason are permitted within the description of a work.

Because the format and internal structure of cast lists are unpredictable, a **<castList>** may contain any combination of **<castItem>** and **<castGrp>** elements.

A **<castItem>** element may contain any mixture of text and the following elements:

**<role>** Name of a dramatic role, as given in a cast list.

**<roleDesc>** Describes a character's role in a drama.

**<perfRes>** Name of an instrument on which a performer plays, a performer's voice range, or a standard performing ensemble designation.

In the following example, **<role>** provides the name of the dramatic character and **<roleDesc>** contains a brief description of the role. The **<perfRes>** element is used to describe the voice range of the role.

```

<castList>
  <castItem>
    <role>Ursula</role>
    <roleDesc>Queen of the Britons</roleDesc>
    <perfRes>Soprano</perfRes>
  </castItem>
  <castItem>
    <role>Dersagrena</role>
    <roleDesc>Handmaiden to Ursula</roleDesc>
    <perfRes>Mezzo-Soprano</perfRes>
  </castItem>
  <castItem>
    <role>Fingal</role>
    <roleDesc>King of the Britons</roleDesc>
    <perfRes>Baritone</perfRes>
  </castItem>
</castList>

```

Listing 78.

The vocal qualities and associated roles for Beethoven's opera *Fidelio* may be encoded as:

```
<perfMedium>
  <castList>
    <castItem>
      <perfRes>Tenor</perfRes>
      <role>Florestan</role>
    </castItem>
    <castItem>
      <perfRes>Soprano</perfRes>
      <role>Leonore</role>
    ,
      <roleDesc>his wife</roleDesc>
    </castItem>
    <castItem>
      <perfRes>Bass</perfRes>
      <role>Rocco</role>
    ,
      <roleDesc>gaoler</roleDesc>
    </castItem>
    <castItem>
      <perfRes>Soprano</perfRes>
      <role>Marzelline</role>
    ,
      <roleDesc>his daughter</roleDesc>
    </castItem>
    <castItem>
      <perfRes>Tenor</perfRes>
      <role>Jaquino</role>
    ,
      <roleDesc>assistant to Rocco</roleDesc>
    </castItem>
    <castItem>
      <perfRes>Bass-baritone</perfRes>
      <role>Don Pizarro</role>
    ,
      <roleDesc>governor of the prison</roleDesc>
    </castItem>
    <castItem>
      <perfRes>Bass</perfRes>
      <role>Don Fernando</role>
    ,
      <roleDesc>King's minister</roleDesc>
    </castItem>
  </castList>
</perfMedium>
```

Listing 79.

The `<castItem>` element may also contain:

**<actor>** Name of an actor appearing within a cast list.

However, this element is unlikely to be useful in the context of a work description. It may be used here, however, for the very rare occasion when a work was conceived for and is only performable by a single person or group, as for certain "performance art" works.

It is common to find some roles presented in groups or sublists. Roles are also often grouped together by their function. To accommodate these situations, the **<castGrp>** element is provided as a component of **<castList>**. It may contain any combination of **<castItem>**, **<castGrp>**, and **<roleDesc>** elements.

### 3.6.7.2 Instrumentation

The **<perfResList>** element is used to capture the solo and ensemble instrumental and vocal resources of a composition. For example, a work for a standard ensemble may be indicated thus:

```
<perfMedium>
  <perfResList>
    <perfRes>Orchestra</perfRes>
  </perfResList>
</perfMedium>
```

Listing 80.

The detailed make-up of standard and non-standard ensembles may also be enumerated:

```
<perfMedium>
  <perfResList>
    <head>Orchestration</head>
    <perfRes>Flute</perfRes>
    <perfRes>Oboe</perfRes>
    <perfRes>English Horn</perfRes>
    <perfRes>2 Horns in D</perfRes>
    <perfRes>Strings</perfRes>
  </perfResList>
</perfMedium>
```

Listing 81.

Where multiple instruments of the same kind are used, the count attribute on **<perfRes>** may be used to encode the exact number of players called for.

```
<perfMedium>
  <perfResList>
    <!-- concert band -->
    <perfRes count="2">Piccolo</perfRes>
    <perfRes count="2">Flute</perfRes>
    <perfRes count="3">1st Clarinet</perfRes>
    <perfRes count="3">2nd Clarinet</perfRes>
    <perfRes count="3">3rd Clarinet</perfRes>
    <!-- and so on -->
  </perfResList>
</perfMedium>
```

Listing 82.

Instrument or voice specifications may be grouped using the `<perfResList>` element and a label assigned to the group with

`<head>`. For example:

---

```
<perfMedium>
  <perfResList>
    <!-- concert band -->
    <perfResList>
      <head>Woodwinds</head>
      <perfRes count="2">Piccolo</perfRes>
      <perfRes count="2">Flute</perfRes>
      <perfRes count="3">1st Clarinet</perfRes>
      <perfRes count="3">2nd Clarinet</perfRes>
      <perfRes count="3">3rd Clarinet</perfRes>
      <!-- etc. -->
    </perfResList>
    <perfResList>
      <head>Brass</head>
      <perfRes count="3">1st Trumpet</perfRes>
      <perfRes count="3">2nd Trumpet</perfRes>
      <perfRes count="3">3rd Trumpet</perfRes>
      <!-- etc. -->
    </perfResList>
    <!-- and so on -->
  </perfResList>
</perfMedium>
```

Listing 83.

```

<perfMedium>
  <perfResList>
    <perfResList>
      <head>Woodwinds</head>
      <perfRes codedval="wa" count="2">2 Flutes
        <perfRes codedval="wz">(2. piccolo)</perfRes>
      </perfRes>
      <perfRes codedval="wc" count="1">1 Oboe</perfRes>
      <!-- ... -->
    </perfResList>
    <perfResList>
      <head>Strings (8-6-4-4-2)</head>
      <perfRes count="8">Violin 1</perfRes>
      <perfRes count="6">Violin 2</perfRes>
      <perfRes count="4">Viola</perfRes>
      <perfRes count="4">Violoncello</perfRes>
      <perfRes count="2">Double Bass</perfRes>
    </perfResList>
  </perfResList>
</perfMedium>

```

Listing 84.

The preceding example also demonstrates how instrumental doublings can be accommodate through the use of nested `<perfRes>` elements. Only the outer-most `perfRes` element should use the `count` attribute. Its value should reflect the total number of performers, not the number of instruments played.

The `<perfRes>` element provides the `codedval` attribute, which can be used to record a coded value that represents the string value stored as the element's content. It is recommended that coded values be taken from a standardized list, such as the International Association of Music Libraries' Medium of Performance Codes List or the MARC Instruments and Voices Code List.

```

<perfMedium>
  <perfResList>
    <!-- @codedval contains values from the MARC Instruments and Voices Code List -->
    <perfRes codedval="ba">Horn</perfRes>
    <perfRes codedval="bb">Trumpet</perfRes>
    <perfRes codedval="bd">Trombone</perfRes>
  </perfResList>
</perfMedium>

```

Listing 85.

Solo parts may be marked with the `solo` attribute of `<perfRes>`, like so:

```
<perfResList>
  <perfRes solo="true">Violin</perfRes>
  <perfRes>Violin</perfRes>
  <perfRes>Violin</perfRes>
  <perfRes>Viola</perfRes>
  <perfRes>Violoncello</perfRes>
</perfResList>
```

---

#### Listing 86.

Music for a single player does not have to be marked as solo with the solo attribute.

An *ad libitum* part, i.e. not essential for the performance of the work, may be marked with the adlib attribute.

---

```
<perfResList>
  <perfRes>Soprano</perfRes>
  <perfRes>Alto</perfRes>
  <perfRes>Tenor</perfRes>
  <perfRes>Bass</perfRes>
  <perfRes adlib="true">Organ</perfRes>
</perfResList>
```

---

#### Listing 87.

### 3.6.8 Audience and Context

**<audience>** Defines the class of user for which the work is intended, as defined by age group (e.g., children, young adults, adults, etc.), educational level (e.g., primary, secondary, etc.), or other categorization.

**<context>** The historical, social, intellectual, artistic, or other context within which the work was originally conceived (e.g., the 17th century restoration of the monarchy in England, the aesthetic movement of the late 19th century, etc.) or the historical, social, intellectual, artistic, or other context within which the expression was realized.

The intended audience for the work and additional information about context for the work that is not captured in more specific elements elsewhere, such as **<history>** and its sub-components, may be recorded in the **<audience>** and **<context>** elements.

### 3.6.9 Work Contents

**<contents>** List of the material contained within a resource.

**<contentItem>** Contains a single entry within a content description element.

Often, it is helpful to identify an entity by listing its constituent parts. A simple description of the work's content, such as may be found in a bibliographic record, can be given in single paragraph element:

---

```
<contents>
  <p>A suitable tone ; Left hand colouring ; Rhythm and accent ; Tempo ; Flexibility ; Ornaments
  </p>
</contents>
```

Listing 88.

---

Alternatively, a structured list of contents may be constructed using the `<contentItem>` element:

---

```
<contents>
  <contentItem>Sonata in D major, op. V, no. 1 / Corelli</contentItem>
  <contentItem>Sonata in G minor / Purcell (with Robert Donington, gamba)</contentItem>
  <contentItem>Forlane from Concert royal no. 3 / Couperin</contentItem>
</contents>
```

Listing 89.

---

Each `<contentItem>` element may be preceded by an optional `<label>`:

---

```
<contents>
  <label>1</label>
  <contentItem>Sonata in D major, op. V, no. 1 / Corelli</contentItem>
  <label>2</label>
  <contentItem>Sonata in G minor / Purcell (with Robert Donington, gamba)</contentItem>
  <label>3</label>
  <contentItem>Forlane from Concert royal no. 3 / Couperin</contentItem>
</contents>
```

Listing 90.

---

To reference a contents list in an external location, use the target attribute:

---

```
<contents target="http://www.contentProvider.org/toc/toc01.html"/>
```

Listing 91.

---

To facilitate the creation of music catalogs based on MEI header information, `<contents>` may contain a heading:

---

```
<contents>
  <head>Contents of this Work:</head>
  <contentItem>Sonata No. 1</contentItem>
  <contentItem>Sonata No. 2</contentItem>
  <contentItem>Sonata No. 3</contentItem>
</contents>
```

Listing 92.

---

### 3.6.10 Bibliographic Evidence

**<biblList>** List of bibliographic references.

The **<biblList>** element allows citation of bibliographic evidence supporting assertions made within other sub-components of the work description.

### 3.6.11 Notes Statement

The **<notesStmt>** element may be used within the description of the musical work to capture information not accounted for by the other elements of the description.

### 3.6.12 Classification

Within **<work>**, the **<classification>** element is used to classify the work according to some classification scheme. More generally, **<classification>** may be used to classify any FRBR entity (**<work>**, **<expression>**, **<manifestation>**, or **<item>**). The following elements are provided for this purpose:

**<termList>** Collection of text phrases which describe a resource.

**<term>** Keyword or phrase which describes a resource.

The **<termList>** element categorizes the parent entity by supplying a set of terms which may describe its topic or subject matter, its physical or intellectual form, date, etc. Each term is indicated by a **<term>** element. In some schemes, the order of items in the list is significant, for example, from major topic to minor; in others, the list has an organized substructure of its own. No recommendations are made here as to which method is to be preferred. Wherever possible, such terms should be taken from a recognized source. In its simplest form, the **<term>** element just contains a descriptive keyword.

---

```
<termList>
  <term>motet</term>
</termList>
```

Listing 93.

---

The class attribute may be used on each term element to make reference to a classification scheme (declared in the [<classDecls>](#) element) from which it is drawn.

```
<classification>
  <termList>
    <term class="#header.LCSH">Guitar music (Rock)</term>
    <term class="#header.LCSH">Rock music 1971-1980.</term>
    <term class="#header.LoC_lcco">M1630.18.Z26 06 2011</term>
  </termList>
</classification>
```

Listing 94.

Alternatively, class may be used on [<termList>](#) when all the contained terms come from the same source.

```
<classification>
  <termList class="#header.LCSH">
    <term>Guitar music (Rock)</term>
    <term>Rock music 1971-1980.</term>
  </termList>
  <termList class="#header.LoC_lcco">
    <term>M1630.18.Z26 06 2011</term>
  </termList>
</classification>
```

Listing 95.

### 3.6.13 Work Relationships

When the FRBR (Functional Requirements for Bibliographic Records) module is available, the following elements may be used within [<work>](#) to describe relationships between the work being described and other works or between the work and expressions of it:

**<expressionList>** Gathers bibliographic expression entities.

**<componentList>** Container for intellectual or physical component parts of a bibliographic entity.

**<relationList>** Gathers relation elements.

For more information about FRBR and the use of these elements, see chapter [3.5 Functional Requirements for Bibliographic Records \(FRBR\)](#).

## 3.7 Encoding Sources in MEI

The `<manifestation>` and `<item>` elements allow detailed description of various types of sources, for instance, a printed text or manuscript, another computer file, an audio or video recording, or a combination of these. Both `<manifestation>` and `<item>` are part of the [3.5 Functional Requirements for Bibliographic Records \(FRBR\)](#) implementation in MEI. Please note: in MEI 3.0.0, the `<source>` element was used to capture this type of information. The `<manifestation>` element may contain the following elements:

- <head>** Contains any heading, for example, the title of a section of text, or the heading of a list.
- <locusGrp>** Groups locations which together form a distinct but discontinuous item within a manuscript or manuscript part, according to a specific foliation.
- <identifier>** An alpha-numeric string that establishes the identity of the described material.
- <titleStmt>** Container for title and responsibility meta-data.
- <editionStmt>** Container for meta-data pertaining to a particular edition of the material being described.
- <pubStmt>** Container for information regarding the publication or distribution of a bibliographic item, including the publisher's name and address, the date of publication, and other relevant details.
- <availability>** Groups elements that describe the availability of and access to a bibliographic item, including an MEI-encoded document.
- <physDesc>** Container for information about the appearance, construction, or handling of physical materials, such as their dimension, quantity, color, style, and technique of creation.
- <physLoc>** Groups information about the current physical location of a bibliographic item, such as the repository in which it is located and its shelf mark(s), and its previous locations.
- <seriesStmt>** Groups information about the series, if any, to which a publication belongs.
- <creation>** Non-bibliographic details of the creation of an intellectual entity, in narrative form, such as the date, place, and circumstances of its composition. More detailed information may be captured within the history element.
- <history>** Provides a container for information about the history of a resource other than the circumstances of its creation.
- <langUsage>** Groups elements describing the languages, sub-languages, dialects, etc., represented within the encoded resource.
- <contents>** List of the material contained within a resource.
- <biblList>** List of bibliographic references.
- <notesStmt>** (notes statement)– Collects any notes providing information about a text additional to that recorded in other parts of the bibliographic description.
- <classification>** Groups information which describes the nature or topic of an entity.
- <itemList>** Gathers bibliographic item entities.
- <componentList>** Container for intellectual or physical component parts of a bibliographic entity.
- <relationList>** Gathers relation elements.

**<extMeta>** Provides a container element for non-MEI metadata formats.

The content of the **<item>** is quite similar to **<manifestation>** with a few omissions:

Please note that in case of handwritten sources the singleton attribute is available for the **<manifestation>** element to indicate a unique physical object, precisely, manifestation singleton are sources produced as unique objects, with no siblings intended in the course of their production. ([Definition of FRBRoo](#), p. 57). These cases result in **<item>** and **<manifestation>** being essentially the same.

**<head>** Contains any heading, for example, the title of a section of text, or the heading of a list.

**<identifier>** An alpha-numeric string that establishes the identity of the described material.

**<availability>** Groups elements that describe the availability of and access to a bibliographic item, including an MEI-encoded document.

**<physDesc>** Container for information about the appearance, construction, or handling of physical materials, such as their dimension, quantity, color, style, and technique of creation.

**<physLoc>** Groups information about the current physical location of a bibliographic item, such as the repository in which it is located and its shelf mark(s), and its previous locations.

**<history>** Provides a container for information about the history of a resource other than the circumstances of its creation.

**<notesStmt>** (notes statement)– Collects any notes providing information about a text additional to that recorded in other parts of the bibliographic description.

**<classification>** Groups information which describes the nature or topic of an entity.

**<componentList>** Container for intellectual or physical component parts of a bibliographic entity.

**<relationList>** Gathers relation elements.

**<extMeta>** Provides a container element for non-MEI metadata formats.

Many of these elements are already described in chapter 3.1 [3.2 Structure of the MEI Header](#), especially in 3.1.3 [3.6 Work Description](#).

The **<manifestationList>** is available to create lists of physical sources representing a work, for instance for use in a thematic catalog or a critical edition. The **<manifestation>** child element corresponds to the [3.5 Functional Requirements for Bibliographic Records \(FRBR\)](#) level of the same name, that is, it describes embodiments of certain expressions of a work. The list below reflects the order in which the optional components of manifestation must occur.

**<locus>** Defines a location within a manuscript or manuscript component, usually as a (possibly discontinuous) sequence of folio references.

**<locusGrp>** Groups locations which together form a distinct but discontinuous item within a manuscript or manuscript part, according to a specific foliation.

**<identifier>** An alpha-numeric string that establishes the identity of the described material.

**<titleStmt>** Container for title and responsibility meta-data.

**<editionStmt>** Container for meta-data pertaining to a particular edition of the material being described.

**<pubStmt>** Container for information regarding the publication or distribution of a bibliographic item, including the publisher's name and address, the date of publication, and other relevant details.

**<physDesc>** Container for information about the appearance, construction, or handling of physical materials, such as their dimension, quantity, color, style, and technique of creation.

**<physLoc>** Groups information about the current physical location of a bibliographic item, such as the repository in which it is located and its shelf mark(s), and its previous locations.

**<seriesStmt>** Groups information about the series, if any, to which a publication belongs.

**<creation>** Non-bibliographic details of the creation of an intellectual entity, in narrative form, such as the date, place, and circumstances of its composition. More detailed information may be captured within the history element.

**<history>** Provides a container for information about the history of a resource other than the circumstances of its creation.

**<langUsage>** Groups elements describing the languages, sub-languages, dialects, etc., represented within the encoded resource.

**<contents>** List of the material contained within a resource.

**<biblList>** List of bibliographic references.

**<notesStmt>** (notes statement)– Collects any notes providing information about a text additional to that recorded in other parts of the bibliographic description.

**<classification>** Groups information which describes the nature or topic of an entity.

**<itemList>** Gathers bibliographic item entities.

**<componentList>** Container for intellectual or physical component parts of a bibliographic entity.

**<relationList>** Gathers relation elements.

### 3.7.1 Title Pages

A specialized element is furnished for the capture of title page information.

**<titlePage>** Contains a transcription of the title page of a text.

The `<titlePage>` element, modelled after a similar element in Encoded Archival Description (EAD), may occur within the textual matter preceding or following the musical content of the encoding. Since a diplomatic transcription of the title page is often necessary to accurately identify musical material contained within a source, `<titlePage>` may also be used within the metadata header as a child of the `<physDesc>` element.

Detailed analysis of the title page and other preliminaries of older printed books and manuscripts is of major importance in descriptive bibliography and the cataloging of printed books. The following elements are suggested as a means of encoding the major features of most title pages for faithful rendition:

**<titlePage>** Contains a transcription of the title page of a text.

**<p>** One or more text phrases that form a logical prose passage.

**<table>** Contains text displayed in tabular form.

**<list>** A formatting element that contains a series of items separated from one another and arranged in a linear, often vertical, sequence.

**<quote>** Contains a paragraph-like block of text attributed to an external source, normally set off from the surrounding text by spacing or other typographic distinction.

**<lg>** May be used for any section of text that is organized as a group of lines; however, it is most often used for a group of verse lines functioning as a formal unit, e.g., a stanza, refrain, verse paragraph, etc.

The following example shows the encoding of the title page of Vaughan Williams' *On Wenlock Edge*. Note the use of the `<lb>` element to mark the line breaks present in the original.

```

<titlePage>
  <p>ON WENLOCK EDGE</p>
  <p>A CYCLE OF SIX SONGS
    <lb/>
    FOR TENOR VOICE ___ WITH ACCOMPANIMENT OF
    <lb/>
    Pianoforte and String Quartet (ad lib)
    <lb/>
    THE WORDS BY A. E. HOUSMAN
    <lb/>
    (FROM "A SHROPSHIRE LAD") </p>
    <p>
      <fig/>
    </p>
    <p>MUSIC BY
      <lb/>
    R. VAUGHAN
      <lb/>
    WILLIAMS </p>
    <list>
      <li>PRICE $3.75</li>
      <li>(COMPLETE WITH SET OF STRING PARTS $5.00</li>
      <li>STRING PARTS SEPARATELY $1.00</li>

```

```
</list>
<p>Boosey & Hawkes, Inc.</p>
<p>New York, U.S.A.</p>
<p>London · Toronto · Sydney · Capetown</p>
</titlePage>
```

Listing 96.

The physical rendition of title page information is often of considerable importance. One approach to this requirement would be to use the `<rend>` element, described in chapter 9.2.2 Text Rendition to specify the rendition of each of the components of the title page. Another would be to employ a CSS stylesheet. Finally, a module customized for the description of typographic entities such as pages, lines, rules, etc., bearing special-purpose attributes to describe line-height, leading, degree of kerning, font, etc. could be employed.

### 3.7.2 Description of folia

While many other elements within `<physDesc>` describe specific features of manuscripts and prints in prose, `<foliaDesc>` is intended to be processable. It provides information about the binding of a manuscript or print and the layout of its pages. The most important elements used are:

- <foliaDesc>** Describes the order of folia and bifolia making up the text block of a manuscript or print.
- <folium>** Describes a single leaf of paper.
- <bifolium>** Describes a folded sheet of paper.

The nesting of `<bifolium>` and `<folium>` elements reflects the nesting of paper sheets that make up the text block of the source. For instance, if a manuscript consists of two folded sheets of paper, with a single, unfolded sheet in the middle, this would be encoded with two nested `<bifolium>` elements, where the inner one has an additional `<folium>` element:

```
<foliaDesc>
  <bifolium>
    <!-- outer sheet -->
    <bifolium>
      <!-- inner sheet -->
      <folium/>
      <!-- single leaf in the middle -->
    </bifolium>
  </bifolium>
</foliaDesc>
```

Listing 97.

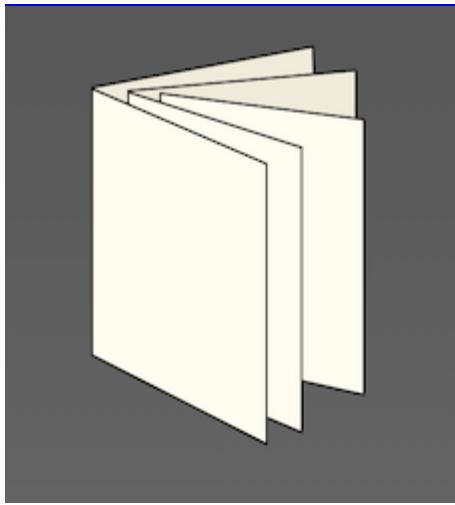

Figure 7. Nesting of two bifolia and one folium

Multiple signatures (groups of nested pages) bound together can be reflected by encoding a sequence of `<bifolium>` elements (with their respective contents). If the binding of a source is unknown, but `<foliaDesc>` is needed for other reasons, it is recommended to use a sequence of `<folium>` elements only, with no indication of nesting at all.

### 3.7.2.1 Linking surface elements

The `<surface>` element and its children are used to relate musical content with digitizations and specific image zones on them (see 12.1.1 Elements of the Facsimile Module). `<surface>` elements are always encoded in sequence within `<facsimile>`, and thus lack the expressiveness of `<foliaDesc>`. However, it is possible to relate these two concepts.

`<folium>` offers two specific attributes:

`recto (att.foliumSurfaces)` A reference to a `<surface>` element positioned on the recto side of the sheet.

`verso (att.foliumSurfaces)` A reference to a `<surface>` element positioned on the verso side of the sheet.

These attributes are used to point to the `xml:id` of a `<surface>` element.

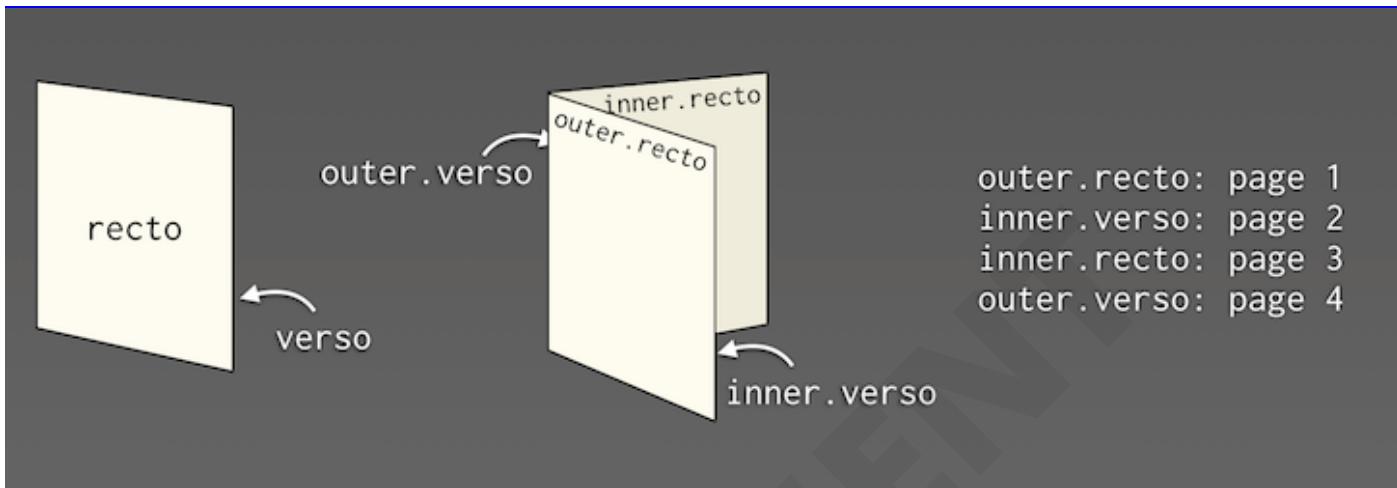

Figure 8. Positional attributes on folium and bifolium

On [<bifolium>](#), the corresponding attributes are:

outer.recto (att.bifoliumSurfaces)	A reference to a <a href="#">&lt;surface&gt;</a> element positioned on the outer recto side of a (folded) sheet.
inner.verso (att.bifoliumSurfaces)	A reference to a <a href="#">&lt;surface&gt;</a> element positioned on the inner verso side of a (folded) sheet.
inner.recto (att.bifoliumSurfaces)	A reference to a <a href="#">&lt;surface&gt;</a> element positioned on the inner recto side of a (folded) sheet.
outer.verso (att.bifoliumSurfaces)	A reference to a <a href="#">&lt;surface&gt;</a> element positioned on the outer verso side of a (folded) sheet.

With those attributes, page numbers can be derived from [<foliaDesc>](#), alongside the information where the content on a given [<surface>](#) is placed on a (bi)folium. Coming back to the example above this might look like so:

```

<foliaDesc>
  <bifolium outer.recto="#surface-p1" inner.verso="#surface-p2" inner.recto="#surface-p9"
            outer.verso="#surface-p10">
    <bifolium outer.recto="#surface-p3" inner.verso="#surface-p4" inner.recto="#surface-p7"
              outer.verso="#surface-p8">
      <folium recto="#surface-p5" verso="#surface-p6"/>
    </bifolium>
  </bifolium>
</foliaDesc>
  
```

Listing 98.

### 3.7.2.2 Specifying page dimensions

Within `<surface>`, each `<graphic>` element may specify its dimensions using the following attributes:

`height (att.height)` Measurement of the vertical dimension of an entity.

`width (att.width)` Measurement of the horizontal dimension of an entity.

The values of those attributes, however, specify the height and width of the digital resource, the scan of the source, and they are typically given in pixels (see 12.1.1 Elements of the Facsimile Module). In contrast, `<folium>` and `<bifolium>` are supposed to provide the dimensions of the original source in cm or inches. This makes it possible to combine separate parts of a manuscripts stored in different libraries, which are scanned at different resolutions. In case of `<bifolium>` elements, these dimensions apply to the *folded* sheet.

Some printed scholarly editions like the *Neue Bach-Ausgabe* provide very detailed information about the sizes and binding of individual leaves of a manuscript; with `<foliaDesc>` and its children it is possible to encode that information in processable ways, even without providing digitizations of the sources via `<surface>`.

### 3.7.2.3 Patches

Sometimes, manuscripts (but also prints) are subject to modifications that do not change the textual content, but the actual physical item. Typical examples for this are patches glued on a page, or cutouts. Both these situations can be encoded inside `<foliaDesc>`.

A patch is an additional writing surface attached to one of the sides of a `<folium>` or `<bifolium>`:

`<patch>` Describes a physical writing surface attached to the original document.

The `<patch>` element is placed inside the `<folium>` or `<bifolium>` to which it is attached. To which side of this parent it is attached is specified using the (required) `attached.to` attribute:

`attached.to (<patch>)` Describes the position of the patch on the parent folium / bifolium.

Depending on the parent, allowed values for `attached.to` are either `recto` and `verso` (in case of `<folium>`) or `outer.recto`, `inner.verso`, `inner.recto` and `outer.verso` (in case of `<bifolium>`).

The exact position of the patch on the underlying surface may be specified using the optional `x` and `y` attributes, which are used to specify the distance from the upper left corner of the patch from the upper left corner of the surface it is attached to. At this point, it is not possible to specify rotation.

The (optional) `attached.by` attribute specifies by which means the patch is attached. Suggested values are: `glue` (patch is glued on surface beneath), `thread` (patch is sewn on surface beneath), `needle` (patch is pinned to the surface beneath), `tape` (patch is taped on surface beneath using an adhesive strip) and `staple` (patch is attached on surface beneath using a staple), but other values may be used as necessary.

While the `<patch>` element provides information about the attachment of a patch, the actual patch is encoded as a `<folium>` or `<bifolium>` child of `<patch>`.

---

```
<bifolium>
  <patch attached.to="inner.verso" x="1cm" y="12cm" attached.by="glue">
    <folium width="8cm" height="2cm"/>
  </patch>
</bifolium>
```

Listing 99.

---

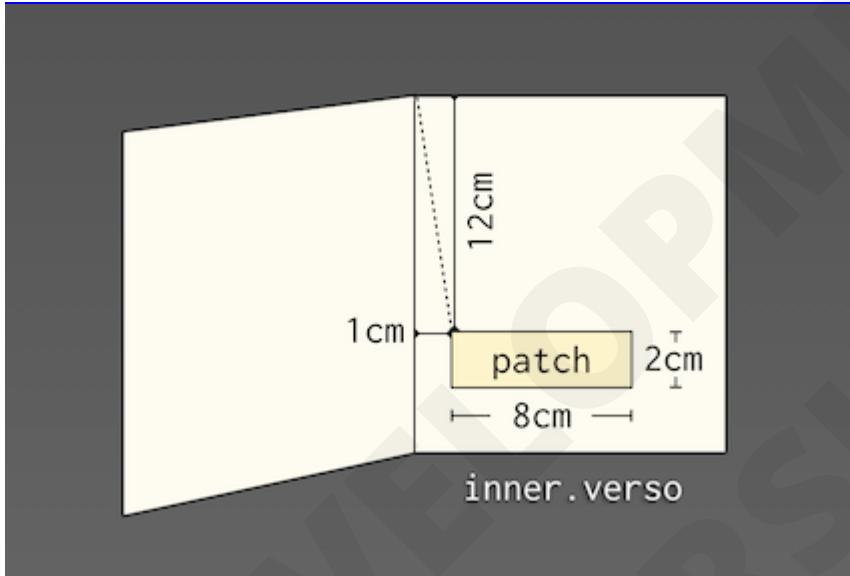

Figure 9. Positioning and sizing of a patch

---

The example above describes a bifolium where a patch is glued to the inner right side.

### 3.7.2.4 Cutouts

**<cutout>** A cutout is a section of a document sheet that has been removed and is now missing.

Cutouts are treated almost similarly as [3.7.2.3 Patches](#). The most relevant attributes are:

removed.from (`<cutout>`) Describes the position of the cutout on the parent folium / bifolium.

removed.by (`<cutout>`) Describes the method of removing the cutout.

The dimensions (width, height) of the parent element (e.g., `<folium>`) indicate the size of the bounding box of the remaining part of the page. That is, if the complete lower half of a page has been cut, the width and height attributes describe the remaining upper half. If, in contrast, only the lower right quarter of the page has been cut, these attributes still indicate the size of the full page (assuming that the removed section was a regular rectangle). The dimensions (width, height) on cutout itself are only to be used when there is a 'gap' in the manuscript that allows to specify the dimensions of that missing part. In this case, the bounding box dimensions are given, together with x and y to indicate the upper left point on the original page. If, however, the removed section is available by itself, then a corresponding `<folium>` (or `<bifolium>`) should be placed inside the cutout element, and should provide its own dimensions using width and height there. In this case, width and height on cutout is expendable.

The genetic aspect of applying patches or cutting out parts of a page is described in [11.3 Genetic Markup](#).

DEVELOPMENT  
VERSION

## 3.8 Typical Use Cases

This chapter introduces common use cases for MEI metadata.

### 3.8.1 Independent Headers

Many libraries, repositories, research sites and related institutions collect bibliographic and documentary information about machine readable music documents without necessarily collecting the music documents themselves. Such institutions may thus want access to the header of an MEI document without its attached text in order to build catalogs, indexes and databases that can be used to locate relevant texts at remote locations, obtain full documentation about those texts, and learn how to obtain them. This section describes a set of practices by which the metadata headers of MEI documents can be encoded separately from those documents and exchanged as freestanding MEI documents. Headers exchanged independently of the documents they describe are called independent headers.

#### 3.8.1.1 Independent MEI Headers

An independent header is an MEI metadata header that can be exchanged as an independent document between libraries, archives, collections, projects, and individuals.

The structure of an independent header is exactly the same as that of an header attached to a document. This means that an `<meiHead>` can be extracted from an MEI document and sent to a receiving institution with little or no change.

When deciding which information to include in the independent header, and the format or structure of that information, the following should be kept in mind:

- The independent header should provide full bibliographic information about the encoded text, its sources, where the text can be located, and any restrictions governing its use.
- The independent header should contain useful information about the encoding of the text itself. In this regard, it is highly recommended that the encoding description be as complete as possible. The Guidelines do not require that the encoding description be included in the header (since some simple transcriptions of small items may not require it), but in practice the use of a header without an encoding description would be severely limited.
- The independent header should be amenable to automatic processing, particularly for loading into databases and for the creation of publications, indexes, and finding aids, without undue editorial intervention on the part of the receiving institution. For this reason, two recommendations are made regarding the format or structure of the header: first, where there is a choice between a prose content model and one that contains a formal series of specialized elements, wherever possible and appropriate the specialized elements should be preferred to unstructured prose. Second, with respect to corpora, information about each of the texts within a corpus should be included in the overall corpus-level `meiHead`. That is, source information, editorial practices, encoding descriptions, and the like should be included in the relevant sections of the corpus `meiHead`, with pointers to them from the headers of the individual texts included in the corpus. There are three reasons for this

recommendation: first, the corpus-level header will contain the full array of bibliographic and documentary information for each of the texts in a corpus, and thus be of great benefit to remote users, who may have access only to the independent header; second, such a layout is easier for the coder to maintain than searching for information throughout a text; and third, generally speaking, this practice results in greater overall consistency, especially with respect to bibliographic citations.

### 3.8.2 Including non-MEI Metadata in MEI files

The following element is provided to accommodate non-MEI metadata:

**<extMeta>** Provides a container element for non-MEI metadata formats.

The `<extMeta>` element may be contained by `<expression>`, `<item>`, `<manifestation>`, `<work>` and `<meiHead>` elements. It may include text and any number of well-formed XML fragments, XML comments, and CDATA sections, except for MEI markup, which is prohibited. The document element of each fragment must explicitly declare its namespace.

```
<extMeta>
  <!-- MARC (Machine-Readable Cataloging) title info -->
  <datafield ind1="1" ind2="0" tag="245">
    <subfield code="a">Simple dreams :</subfield>
    <subfield code="b">a musical memoir /</subfield>
    <subfield code="c">Linda Ronstadt.</subfield>
  </datafield>
</extMeta>
```

Listing 100.

An MEI processor is not required to validate or otherwise process any markup within the `<extMeta>` element. Therefore, the `<extMeta>` element itself is the lowest level at which an association can be created between ‘foreign’ metadata and other MEI elements as described in section 3.4.1.6.1 [Associating Metadata and Data](#).

### 3.8.3 Minimal and Recommended Header Information

The MEI header allows for the provision of a very large amount of information concerning the text itself, its source, its encodings, and revisions of it, as well as a wealth of descriptive information, such as the languages it uses and the situation(s) in which it was produced, together with the setting and identity of participants within it. This diversity and richness reflects the diversity of uses to which it is envisaged that electronic texts conforming to these Guidelines will be put. It is emphatically not intended that all of the elements described above should be present in every MEI Header.

The amount of encoding in a header will depend both on the nature and the intended use of the text. At one extreme, an encoder may expect that the header will be needed only to provide a bibliographic identification of the text adequate to local needs. At the other, wishing to ensure that their texts can be used for the widest range of applications, encoders will want to document as explicitly as possible both bibliographic and descriptive information, in such a way that no prior or ancillary knowledge about the text is needed in order to process it.

The header in such a case will be very full, approximating the kind of documentation often supplied in the form of a manual. Most texts will lie somewhere between these extremes; textual corpora in particular will tend more to the latter extreme. In the remainder of this section we demonstrate first the minimal, and then a commonly recommended, level of encoding for the bibliographic information held by the MEI header.

Supplying only the level of encoding required, the MEI header of a single text will look like the following example:

---

```
<meiHead>
  <fileDesc>
    <titleStmt>
      <title>Fughette (in Gottes Namen Fahren wir - Dies sind die heil'gen zehn Gebote) for
          Brass Quintett : an electronic transcription </title>
    </titleStmt>
    <pubStmt>
      <respStmt>
        <corpName auth.uri="http://d-nb.info/gnd" auth="GND"
          codedval="5115204-6">Musikwissenschaftliches Seminar <Detmold></corpName>
      </respStmt>
    </pubStmt>
  </fileDesc>
</meiHead>
```

Listing 101.

---

The only mandatory component of the MEI Header is the `<fileDesc>` element. Within this element, `<titleStmt>` and `<pubStmt>` are required constituents. Within the title statement, a title is required. Within the `<pubStmt>`, a publisher, distributor, or other agency responsible for the file is required.

While not formally required, additional information is recommended for a minimally effective header. For example, it is recommended that the person or corporate entity responsible for the creation of the encoding should be specified using `<respStmt>` within the `<titleStmt>` element. It is also recommended that information about the source, or sources, of the encoding be included. Each `<source>` element should contain at the least a loosely structured bibliographic citation that identifies the source used to construct the MEI file.

Furthermore, If the electronic transcription is a member of a series of publications, the series title and publisher should be included using the `<seriesStmt>` element. It is also common for cataloging records to include genre and/or form information, here represented by the MEI `<classification>` element.

We now present the same example header, expanded to include additionally recommended information, adequate for most bibliographic purposes, in particular to allow for the creation of an AACR2-conformant bibliographic record.

---

```
<meiHead>
  <fileDesc>
```

```

<titleStmt>
  <title>Fughette (in Gottes Namen Fahren wir - Dies sind die heil'gen zehn Gebote) for
  Brass Quintett : an electronic transcription </title>
  <respStmt>

### 3.8.4 Header Elements and their Relationship to Other Bibliographic Standards

Mapping elements from the MEI metadata header to another descriptive system may help a repository harvest selected data from the MEI file to build a basic catalog record. For this purpose, the following attribute is provided on most elements occurring within `<meiHead>`:

analog      Contains a reference to a field or element in another descriptive encoding system to which this MEI (att.bibl) element is comparable.

The encoding system to which fields are mapped must be specified in `analog`. When possible, subfields as well as fields should be specified, e.g., subfields within MARC fields.

### 3.8.5 Musical Corpora

The term *corpus* may refer to any collection of musical data, although it is often reserved for collections which have been organized or collected with a particular end in view, generally to illustrate a particular characteristic of, or to demonstrate the variety found in, a group of related texts. The principal distinguishing characteristic of a *corpus* is that its components have been selected or structured according to some conscious set of design criteria.

In MEI, a *corpus* is regarded as a composite text because, although each discrete document in a *corpus* clearly has a claim to be considered as a text in its own right, it is also regarded as a subdivision of some larger object, if only for convenience of analysis. In *corpora*, the component samples are clearly distinct texts, but the systematic collection, standardized preparation, and common markup of the *corpus* often make it useful to treat the entire

corpus as a unit, too. Corpora share a number of characteristics with other types of composite texts, including anthologies and collections. Most notably, different components of composite texts may exhibit different structural properties, thus potentially requiring elements from different MEI modules.

Aside from these high-level structural differences, and possibly differences of scale, the encoding of language corpora and the encoding of individual texts present identical sets of problems. Therefore, any of the encoding techniques and elements presented in other chapters of these Guidelines may therefore prove relevant to some aspect of corpus encoding and may be used in corpora.

### 3.8.5.1 Corpus Module Overview

The meiCorpus module defines a single element:

**<meiCorpus>** A group of related MEI documents, consisting of a header for the group, and one or more <mei> elements, each with its own complete header.

The <meiCorpus> element is intended for the encoding of corpora, though it may also be useful in encoding any collection of disparate materials. The individual samples in the corpus are encoded as separate <mei> elements, and the entire corpus is enclosed in an <meiCorpus> element. Each sample has the usual structure for a <mei> document, comprising an <meiHead> followed by a <music> element. The corpus, too, has a corpus-level <meiHead> element, in which the corpus as a whole, and encoding practices common to multiple samples may be described. The overall structure of an MEI-conformant corpus is thus:

```
<meiCorpus>
  <meiHead type="corpus">
    <!-- metadata for the corpus -->
  </meiHead>
  <mei>
    <meiHead type="text">
      <!-- metadata for sample 1 -->
    </meiHead>
    <music>
      <!-- the encoding of sample 1 -->
    </music>
  </mei>
  <mei>
    <meiHead type="text">
      <!-- metadata for sample 2 -->
    </meiHead>
    <music>
      <!-- the encoding of sample 2 -->
    </music>
  </mei>
</meiCorpus>
```

Listing 103.

This two-level structure allows for metadata to be specified at the corpus level, at the individual text level, or at both. However, metadata which relates to the whole corpus rather than to its individual components should be removed from the individual component metadata and included only in the [`<meiHead>`](#) element prefixed to the whole.

In some cases, the design of a corpus is reflected in its internal structure. For example, a corpus of musical incipits might be arranged to combine all compositions of one type (symphonies, songs, chamber music, etc.) into some higher-level grouping, possibly with sub-groups for date of publication, instrumentation, key, etc. The [`<meiCorpus>`](#) element provides no support for reflecting such internal structure in the markup: it treats the corpus as an undifferentiated series of components, each tagged with an [`<mei>`](#) element.

If it is essential to reflect the organization of a corpus into sub-components, then the members of the corpus should be encoded as composite texts instead, using the [`<group>`](#) element described section [2.1.2 General Music Structure Elements](#). The mechanisms for corpus characterization described in this chapter, however, are designed to reduce the need to do this. Useful groupings of components may easily be expressed using the classification and identification elements described in section [3.6.12 Classification](#), and those for associating declarations with corpus components described in section [3.4.1.6.1 Associating Metadata and Data](#). These mechanisms also allow several different methods of text grouping to co-exist, each to be used as needed at different times. This helps minimize the danger of cross-classification and mis-classification of samples, and helps improve the flexibility with which parts of a corpus may be characterized for different applications.

All composite texts share the characteristic that their different component texts may be of structurally similar or dissimilar types. If all component texts may all be encoded using the same module, then no problem arises. If however they require different modules, then the various modules must all be included in the schema.

### **3.8.5.2 Combining Corpus and Text Headers**

An MEI-conformant document may have more than one header only in the case of a TEI corpus, which must have a header in its own right, as well as the obligatory header for each text. Every element specified in a corpus-header is understood as if it appeared within every text header in the corpus. An element specified in a text header but not in the corpus header supplements the specification for that text alone. If any element is specified in both corpus and text headers, the corpus header element is over-ridden for that text alone.

The [`<titleStmt>`](#) for a corpus text is understood to be prefixed by the [`<titleStmt>`](#) given in the corpus header. All other optional elements of the [`<fileDesc>`](#) should be omitted from an individual corpus text header unless they differ from those specified in the corpus header. All other header elements behave identically, in the manner documented in chapter [3.2 Structure of the MEI Header](#). This makes it possible to state information which is common to the whole of the corpus in the corpus header, while still allowing for individual texts to vary from this common metadata.

For example, the following markup shows the structure of a corpus consisting of three texts, the first and last of which share the same encoding description. The second one has its own encoding description.

```
<meiCorpus>
  <meiHead>
    <fileDesc>
      <!-- corpus file description-->
    </fileDesc>
    <encodingDesc>
      <!-- default encoding description -->
    </encodingDesc>
    <revisionDesc>
      <!-- corpus revision description -->
    </revisionDesc>
  </meiHead>
  <mei>
    <meiHead>
      <fileDesc>
        <!-- file description for this corpus text -->
      </fileDesc>
    </meiHead>
    <music>
      <!-- first corpus text -->
    </music>
  </mei>
  <mei>
    <meiHead>
      <fileDesc>
        <!-- file description for this corpus text -->
      </fileDesc>
      <encodingDesc>
        <!-- encoding description for this corpus text, over-riding the default -->
      </encodingDesc>
    </meiHead>
    <music>
      <!-- second corpus text -->
    </music>
  </mei>
  <mei>
    <meiHead>
      <fileDesc>
        <!-- file description for third corpus text -->
      </fileDesc>
    </meiHead>
    <music>
      <!-- third corpus text -->
    </music>
  </mei>
</meiCorpus>
```

Listing 104.

### 3.8.5.3 Recommendations for the Encoding of Large Corpora

These Guidelines include proposals for the identification and encoding of a far greater variety of textual features and characteristics than is likely to be either feasible or desirable in any one corpus, however large and ambitious. For most large-scale corpus projects, it will therefore be necessary to determine a subset of recommended elements appropriate to the anticipated needs of the project; these mechanisms include the ability to exclude selected element types, add new element types, and change the names of existing elements.

Because of the high cost of identifying and encoding many textual features, and the difficulty in ensuring consistent practice across very large corpora, encoders may find it convenient to divide the set of elements to be encoded into the following four categories:

- required** texts included within the corpus will always encode textual features in this category, should they exist in the text
- recommended** textual features in this category will be encoded wherever economically and practically feasible; where present but not encoded, a note in the header should be made.
- optional** textual features in this category may or may not be encoded; no conclusion about the absence of such features can be inferred from the absence of the corresponding element in a given text.
- proscribed** textual features in this category are deliberately not encoded; they may be transcribed as unmarked up text, or represented as gap elements, or silently omitted, as appropriate.

## 4 Repertoire: Common Music Notation

The module described in this chapter offers the means to describe music in so-called ‘Common Music Notation’ (CMN, sometimes referred to as ‘Common Western Music Notation’). For this purpose, it provides a number of special elements and adds several attribute classes to elements from the [2 Shared Concepts in MEI](#) module.

### 4.1 Introduction

This chapter is supposed to frame the repertoire target by the module, i.e., what is Common Music Notation?

DEVELOPMENT  
VERSION

## 4.2 Basic Elements of CMN

This section describes the use of basic features of MEI important for encoding CMN material. Most of the elements discussed here are defined in chapter 2 [Shared Concepts in MEI](#) of these Guidelines, but are used in music from the CMN repertoire in specialized ways.

### 4.2.1 The Role of the Measure Element

Arguably, the most important element of the CMN module is the `<measure>` element. It is used as a structural unit inside `<section>` elements and acts as a container for ‘events’ from the `model.eventLike` class, such as notes, chords and rests as well as ‘control events’ from the `model.controlEventLike` class, such as slurs and indications of dynamics.

The following example demonstrates the use of the `<measure>` element:

```
<section>
  <measure n="1">
    <staff n="1">
      <layer>
        <chord dur="1">
          <note oct="5" pname="c"/>
          <note oct="4" pname="g"/>
          <note oct="4" pname="e"/>
        </chord>
      </layer>
    </staff>
    <staff n="2">
      <layer>
        <note dur="1" oct="3" pname="c"/>
      </layer>
    </staff>
  </measure>
</section>
```

Listing 105.

---

A `<measure>` slices the flow of a score or part into chunks that normally comply with a duration determined by the meter defined within a preceding `<scoreDef>` or `<staffDef>` element. Each staff in the source material is represented by a `<staff>` element. As the order of the staff elements in the file does not have to reflect their order in the original document, to eliminate confusion they should always refer to a `<staffDef>` element, using either an `n` or `def` attribute. Whereas the `def` attribute uses the `xs:anyURI` datatype, the `n` value refers to the closest preceding `<staffDef>` or `<layerDef>` with the same value in its `n` attribute.

```

<staffDef n="3" xml:id="cmn_staffDef1"/>
<!-- later in the file: --&gt;
&lt;staff def="#cmn_staffDef1"&gt;
  &lt;!-- @def refers to staffDef with this identifier --&gt;
  &lt;!-- staff content --&gt;
&lt;/staff&gt;
<!-- or: --&gt;
&lt;staff n="3"&gt;
  &lt;!-- @n refers to staffDef with this numeric label --&gt;
  &lt;!-- staff content --&gt;
&lt;/staff&gt;
</pre>

```

Listing 106.

Each `<staff>` may hold a number of `<layer>` elements to reflect multiple ‘voices’. Just as with `<staff>`, the order of the `<layer>` elements in the file does not have to reflect their original order in the document, so they also possess `n` and `def` attributes for association with the appropriate layer definition.

```

<staffDef>
  <layerDef n="1" xml:id="cmn_layerDef1"/>
</staffDef>

```

Listing 107.

Later in the file:

```

<section xml:id="cmn_staffDef1">
  <staff def="#cmn_staffDef1">
    <layer def="#cmn_layerDef1">
      <!-- layer content -->
    </layer>
  </staff>
  <!-- OR: -->
  <staff n="3">
    <layer n="1">
      <!-- layer content -->
    </layer>
  </staff>
</section>

```

Listing 108.

## 4.2.2 Defining Score Parameters for CMN

When encoding a score in CMN, MEI relies on the following elements from the [2 Shared Concepts in MEI](#) module:

**<scoreDef>** Container for score meta-information.

**<staffGrp>** A group of bracketed or braced staves.

**<staffDef>** Container for staff meta-information.

**<layerDef>** Container for layer meta-information.

A **<scoreDef>** element is used to specify the common parameters of a score, e.g., key and meter. The most important attributes for this purpose are:

meter.count  
(att.meterSigDefault.log) Captures the number of beats in a measure, that is, the top number of the meter signature. It must contain a decimal number or an expression that evaluates to a decimal number, such as  $2+3$  or  $3*2$ .

meter.unit  
(att.meterSigDefault.log) Contains the number indicating the beat unit, that is, the bottom number of the meter signature.

meter.sym  
(att.meterSigDefault.log) Indicates the use of a meter symbol instead of a numeric meter signature, that is, 'C' for common time or 'C' with a slash for cut time.

keysig (att.keySigDefault.log) Written key signature.

The following example describes a score in common time with 3 flats:

```
<scoreDef keysig="3f" meter.count="4" meter.sym="common" meter.unit="4"/>
```

Listing 109.

---

For encoding more complex time signatures, simple mathematical symbols such as asterisks and plus signs are allowed in meter.count.

Non-standard key signatures have to be encoded with a **<keySig>** element.

Other attributes allow the description of default page and system margins and fonts for text and music:

page.width (att.pages) Describes the width of the page; may be expressed in real-world units or staff steps.  
page.height (att.pages) Specifies the height of the page; may be expressed in real-world units or staff steps.  
page.leftmar (att.pages) Indicates the amount of whitespace at the left side of a page.  
page.topmar (att.pages) Indicates the amount of whitespace at the top of a page.  
page.rightmar (att.pages) Indicates the amount of whitespace at the right side of a page.  
page.botmar (att.pages) Indicates the amount of whitespace at the bottom of a page.

system.leftmar (att.systems)	Describes the amount of whitespace at the left system margin relative to page.leftmar.
system.topmar (att.systems)	Describes the distance from page's top edge to the first system; used for first page only.
system.rightmar (att.systems)	Describes the amount of whitespace at the right system margin relative to page.rightmar.
text.name (att.textStyle)	Provides a default value for the font name of text (other than lyrics) when this information is not provided on the individual elements.
text.fam (att.textStyle)	Provides a default value for the font family name of text (other than lyrics) when this information is not provided on the individual elements.
text.size (att.textStyle)	Provides a default value for the font size of text (other than lyrics) when this information is not provided on the individual elements.
music.name (att.notationStyle)	Sets the default music font name.
music.size (att.notationStyle)	Sets the default music font size.
lyric.name (att.lyricStyle)	Sets the font name default value for lyrics.
lyric.fam (att.lyricStyle)	Sets the font family default value for lyrics.
lyric.size (att.lyricStyle)	Sets the default font size value for lyrics.

There are other attributes that allow the specification of many further details of a score. These are available from the element definitions accessible at `<scoreDef>`, `<staffDef>`, `<staffGrp>` and `<layerDef>`.

When content is provided for `<scoreDef>`, it must contain a `<staffGrp>` element. This element is used to gather individual staves and other staff groups. This is useful for collecting instrumental or vocal groups in a large score, such as woodwinds, brasses, etc., and for assigning a shared label to the group, using the `<label>` and `<labelAbbr>` subelements. The `<staffGrp>` element is also used for the two staves of a grand staff. The bar.thru attribute on `<staffGrp>` allows one to specify whether bar lines are drawn across the space between staves of that group or only on the staves themselves.

A `<staffDef>` element is used to describe an individual staff of a `<score>` or performer `<part>`. It bears most of the attributes described above. The `<label>` and `<labelAbbr>` subelements may be used for providing staff labels for the first and subsequent systems.

Every `<staffDef>` must have an `n` attribute with an integer as its value. The first occurrence of a `<staffDef>` with a given number must also indicate the number of staff lines via the `lines` attribute.

The order of `<staffDef>` elements within `<scoreDef>` follows the order of staves in the source document or planned rendering. The individual `<staff>` elements within a `<measure>` refer to these `<staffDef>` declarations using their own `n` attribute values. Therefore, the encoding order of staves within a measure does not have to mimic the order of the `<staffDef>` elements with `<scoreDef>`.

In addition to the parameters inherited from `<scoreDef>`, the following attributes are important for `<staffDef>` elements:

clef.line (att.cleffing.log)	Contains a default value for the position of the clef. The value must be in the range between 1 and the number of lines on the staff. The numbering of lines starts with the lowest line of the staff.
clef.shape (att.cleffing.log)	Encodes a value for the clef symbol.
clef.dis (att.cleffing.log)	Records the amount of octave displacement to be applied to the clef.
clef.dis.place (att.cleffing.log)	Records the direction of octave displacement to be applied to the clef.

A staff with a tenor clef is encoded as in the following example:

---

```
<staffDef clef.dis="8" clef.dis.place="below" clef.line="2" clef.shape="G"/>
```

Listing 110.

---

In the case of transposing instruments, the key-related attributes described above may be used to override the written key expressed in the `<scoreDef>` element. As a basic principle, MEI always captures written pitches, so the `trans.diat` and `trans.semi` attributes may be used to indicate the number of diatonic steps and semitones to calculate sounded pitch from written pitch. The piccolo and E♭ clarinet staves in the example below utilize these attributes:

---

```
<scoreDef meter.count="6" meter.unit="8">
  <staffGrp>
    <!-- Piccolo sounds 12 semitones higher than written (and encoded in MEI). -->
    <staffDef clef.line="2" clef.shape="G" key.mode="major" keysig="4f" label="Piccolo"
      label.abbr="Picc." lines="5" n="1" trans.diat="0" trans.semi="12" xml:id="cmn.P1"/>
    <staffDef clef.line="2" clef.shape="G" key.mode="major" keysig="4f" label="Flute"
      label.abbr="Fl." lines="5" n="2" xml:id="cmn.P2"/>
    <staffDef clef.line="2" clef.shape="G" key.mode="major" keysig="4f" label="Oboe"
      label.abbr="Ob." lines="5" n="3" xml:id="cmn.P3"/>
    <staffDef clef.line="4" clef.shape="F" key.mode="major" keysig="4f" label="Bassoon"
      label.abbr="Bsn." lines="5" n="4" xml:id="cmn.P4"/>
    <!-- Clarinet sounds a minor third (two diatonic steps or three semitones) higher than
        written. -->
    <staffDef clef.line="2" clef.shape="G" key.mode="major" keysig="1f" label="Clarinet in E♭"
      label.abbr="E♭ Cl." lines="5" n="5" trans.diat="2" trans.semi="3" xml:id="cmn.P5"/>
  </staffGrp>
</scoreDef>
```

Listing 111.

---

There are a number of additional elements that can be used as children of `<staffDef>` in order to describe additional features of the staff, such as the color of a clef or a key signature added in a different hand. These elements include:

- <clef>** Indication of the exact location of a particular note on the staff and, therefore, the other notes as well.
- <clefGrp>** A set of simultaneously-occurring clefs.
- <keySig>** Written key signature.
- <keyAccid>** Accidental in a key signature.
- <label>** A container for document text that identifies the feature to which it is attached. For a "tool tip" or other generated label, use the label attribute.
- <meterSig>** Written meter signature.
- <meterSigGrp>** Used to capture alternating, interchanging, mixed or other non-standard meter signatures.

With the exception of `<label>`, these elements may also occur within the flow of musical events captured in a `<layer>`, since they are members of `model.eventLike`. In the layer context they function as milestones and affect all following content assigned to the layer (even in subsequent measures) until their information is again overridden either by the same element bearing different information or a `<staffDef>` or `<scoreDef>`. In this context, it is also possible to combine them with the elements described in chapters 11.1 Critical Apparatus and 11.2 Editorial Markup of these Guidelines.

Such flexibility as this may require close inspection of an encoding to retrieve the correct definitions for a given staff. As a general rule, the closest preceding and most specific element provides this information: For example, a `<keySig>` in the preceding measure is more relevant than a `<staffDef>` at the beginning of the section, which is more relevant than a `<scoreDef>` at the beginning of the score. However, a section-specific `<scoreDef>` that provides only information about the meter does not override the more specific information about key signature gathered from a `<staffDef>` for a transposing instrument.

Every `<staffDef>` may contain a number of `<layerDef>` elements, which may be used to establish default values for the distinct layers sharing one staff. MEI does not use the term 'voice' to describe these 'musical threads' because that term implies continuity across measure boundaries. Given the sometimes arbitrary relationships between these threads from measure to measure as well as across staves, MEI uses the more neutral term 'layer'.

### 4.2.3 Special cases in staff definitions

Usually `<clef>`, `<key>`, and `<meterSig>` apply to a whole staff.

In some rare cases one can find different meters in different layers, as seen in Maurice Ravel's *Oiseaux tristes*.

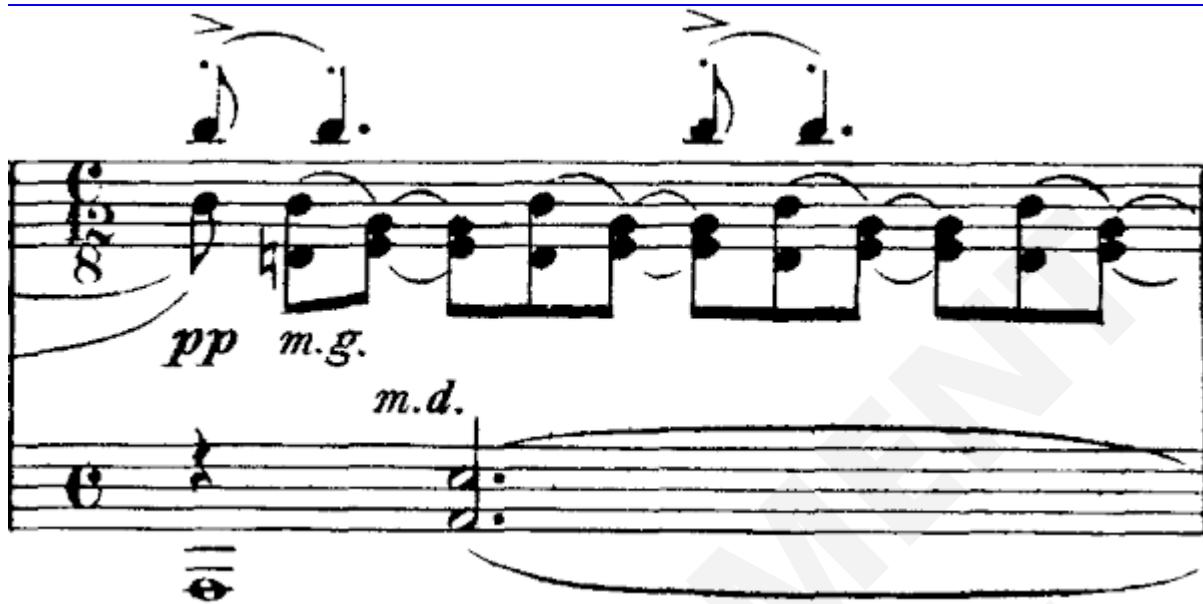

Figure 10. Different meters in different layers on the upper staff

In these cases it is necessary to encode each `<meterSig>` for the staff as child of the corresponding `<layerDef>`:

```

<staffGrp bar .thru="true">
  <staffDef n="1">
    <layerDef n="1">
      <meterSig count="4" unit="4" sym="common" />
    </layerDef>
    <layerDef n="2">
      <meterSig count="12" unit="8" />
    </layerDef>
  </staffDef>
  <staffDef n="2" lines="5">
    <layerDef n="1">
      <meterSig count="4" unit="4" sym="common" />
    </layerDef>
  </staffDef>
</staffGrp>

```

Listing 112.

#### 4.2.4 Re-definition of Score Parameters

Sometimes it is necessary to re-define the parameters of a score or a staff. For example, a score may change keys, the number of staves, or use different layout settings. Likewise, a staff may change its clef, change the number of layers, or become invisible. To accommodate these changes, `<staffDef>` is allowed to occur in the following locations:

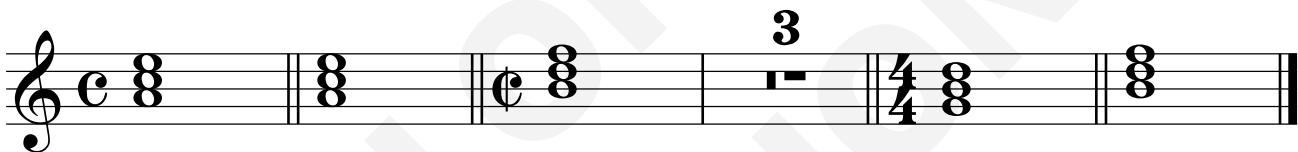

- within the description of staff groups; that is, in `staffGrp`,
- within the content of a `measure`,
- between measures; that is, directly within `section` and `ending` elements, and
- between sections and endings; that is, directly within a `score` or `part` element.

In addition, `<scoreDef>` is allowed to occur:

- within sections and endings; that is, inside `section` and `ending` elements; and
- between sections and endings; that is, directly within a `score` or `part`.

It is also possible to include `<scoreDef>` and `<staffDef>` in staves and layers when the MEI All schema is in use; however, this practice is not recommended for the CMN repertoire.

The following example shows how to change the key and meter signatures within a score. The `keysig.cancelaccid` attribute may be used to control the position of the cancellation accidentals of the key signature change, while the `keysig.visible` can be used to hide the key signature entirely.

```

<scoreDef keysig="4f" meter.sym="common">
  <staffGrp>
    <staffDef n="1" lines="5" clef.shape="G" clef.line="2"/>
  </staffGrp>
</scoreDef>
<section>
  <measure right="dbl" n="1">
    <staff n="1">
      <layer n="1">
        <chord dur="1">
          <note oct="4" pname="a" accid.ges="f"/>
          <note oct="5" pname="c" accid.ges="f"/>
          <note oct="5" pname="e" accid.ges="f"/>
        </chord>
      </layer>
    </staff>
  </measure>
  <scoreDef key.sig="0" keysig.cancelaccid="none"/>
  <measure right="dbl" n="4">
    <staff n="1">

```

```

<layer n="1">
  <chord dur="1">
    <note oct="4" pname="a"/>
    <note oct="5" pname="c"/>
    <note oct="5" pname="e"/>
  </chord>
</layer>
</staff>
</measure>
<scoreDef keysig="2s" keysig.cancelaccid="before" meter.sym="cut"/>
<measure n="2">
  <staff n="1">
    <layer n="1">
      <chord dur="1">
        <note oct="4" pname="b"/>
        <note oct="5" pname="d"/>
        <note oct="5" pname="f" accid.ges="s"/>
      </chord>
    </layer>
  </staff>
</measure>

Listing 113.

## 4.2.5 Notes, Chords and Rests in CMN

### 4.2.5.1 Notes

Undoubtedly, the most important element for any music notation representation is the `<note>` element, which is defined in section [2.2.3 Basic Music Events](#). This section describes the usage of `<note>` in the CMN repertoire as well as CMN-specific additions to the basic definition in the shared module.

#### 4.2.5.1.1 Basic Usage of Notes in CMN

In CMN, notes are determined by three basic parameters:

- pitch name (using `pname`)
- octave (using `oct`)
- duration (using `dur`)

A single note, in this case a quarter note C4, is therefore encoded as:

```
<note dur="4" oct="4" pname="c" />
```

Listing 114.

The default values for `pname` and `oct` conform to the [Scientific Pitch Notation \(SPN\)](#) (also known as American Standard Pitch Notation); that is, the letters A–G indicate the musical note name of a pitch, and the numbers 0–9 indicate the octave range to which a note belongs. `pname` values differ from this convention only by using lower case values for pitches (a–g instead of A–G). The value for `oct` changes between B and C, that is, octave ranges go from C, D, ..., G, A, to B. For example, *middle C* or *c'* (the C in the middle, i.e., fourth C key from left, on a standard 88-key piano keyboard) is represented on the first ledger line in G clef notation and labelled as *C4*, in the naming convention of SPN. The note one semitone below would be labelled *B3*, and *A4* would refer to the first A above *C4*.

The usual CMN-specific values for `dur` are:

- 1 whole note

- 2** half note
- 4** quarter note
- 8** eighth note
- 16** sixteenth note
- ...
- 2048** 2048th note

Additionally, the following two values borrowed from mensural notation are allowed, as they sometimes also appear in CMN:

- breve** double whole
- long** quadruple whole

Please note that their mensural counterparts bear different names in order to clearly distinguish between repertoires.

Dotted durational values are accommodated by the dots attribute, which records the number of written augmentation dots. Thus, a dotted quarter note is represented as in the following example:

---

```
<note dots="1" dur="4" oct="4" pname="c"/>
```

---

Listing 115.

---

#### 4.2.5.1.2 Grace Notes

The CMN module adds two optional attributes, grace and grace.time, to `<note>` and `<chord>`. The presence of the grace attribute indicates a grace note or chord.

---

Figure 11. Grace notes

---

The encoding of the left-most example would look like this:

```
<beam>
  <note dur="8" oct="5" pname="d" stem.dir="down"/>
  <note dur="8" oct="5" pname="e" stem.dir="up" grace="unacc" stem.mod="1slash"/>
  <note dur="8" oct="5" pname="d" stem.dir="down"/>
  <note accid="s" dur="8" oct="5" pname="c" stem.dir="up" grace="unacc" stem.mod="1slash"/>
  <note dur="8" oct="5" pname="d" stem.dir="down"/>
  <note dur="8" oct="4" pname="b" stem.dir="down"/>
</beam>
```

Listing 116.

Grace notes are not counted when determining the measure's conformance to the current time signature. Therefore, the dur attribute records only the *written* rhythmic value of the grace note. The time necessary for the performance of grace notes can be unspecified, calculated based on taking time from other non-grace notes, or specified precisely using the dur.ges attribute.

The values of grace indicate from which note time is 'borrowed' to perform the grace note: The preceding note, in which case the value unacc (unaccented) is used, or the following note, when the value acc (accented) is appropriate. Technically, this value determines if the note following the grace will keep its original onset time or will be slightly delayed to allow the grace note itself to be accented. Sometimes it is not clear how to perform a grace; in these situations the value unknown allows one to indicate a grace note while unambiguously stating that its performed duration remains unknown.

The grace.time attribute is only to be used in combination with the grace attribute. It records the amount of time (as a percentage of the written duration) that the grace note should 'steal' from the preceding note (when grace="unacc") or the following note (when grace="acc").

Grace notes can be placed within a `<graceGrp>` element, which itself allows all values for grace as explained above. The optional attach attribute is used to record whether the grace note group is attached to the following event or to the preceding one. The `<graceGrp>` element can be used with single or multiple grace notes.

More information about grace notes in the context of other CMN ornaments is available in chapter [4.4 Common Music Notation Ornaments](#).

### 4.2.5.2 Chords

Often we find multiple notes that are not sounding in succession but sounding simultaneously. These chords in MEI are basically defined as a container of notes that are stemmed together.

#### 4.2.5.2.1 Chords in CMN

A chord is any set of pitches consisting of multiple notes that are to be played simultaneously and are usually grouped together visually with a single stem. In MEI the `<chord>` element functions as a container for all participating notes. Also it features many attributes that are allowed for notes, e.g., usually all notes in a chord have a common duration, so it can be applied to the whole chord within its `dur` attribute.

Some notational features like articulations or lyrics are connected to a whole chord instead of a single note. Therefore elements like `<artic>` or `<verse>` are also allowed as children of `<chord>` elements. In the following example from Sergei Rachmaninoff's *Prelude in C-sharp minor*, Op. 3, No. 2 all chords carry an accent.

Figure 12. Chords in Rachmaninoff's Prelude in C-sharp minor, Op. 3, No. 2

```

<layer>
  <chord xml:id="ex-1877520550" dur="2" stem.dir="up">
    <artic artic="acc" place="above"/>
    <note oct="3" pname="c" accid.ges="s"/>
    <note oct="3" pname="e"/>
    <note oct="3" pname="g" accid.ges="s"/>
    <note oct="4" pname="c" accid.ges="s"/>
  </chord>

```

```

<chord xml:id="ex-1072408883" dur="4" stem.dir="up">
  <artic artic="acc" place="above"/>
  <note oct="3" pname="a">
    <accid accid="n"/>
  </note>
  <note oct="4" pname="a">
    <accid accid="n"/>
  </note>
</chord>
<chord xml:id="ex-0929208104" dur="4" stem.dir="up">
  <artic artic="acc" place="above"/>
  <note oct="3" pname="g" accid.ges="s"/>
  <note oct="4" pname="g" accid.ges="s"/>
</chord>
</layer>

```

Listing 117.

#### 4.2.5.2.2 Stem Modifications

The stem.mod attribute accommodates various stem modifiers found in the CMN repertoire. These symbols are placed on a note or chord's stem and generally indicate different types of tremolo and Sprechstimme. The following values are allowed:

- 1slash** 1 slash through stem
- 2slash** 2 slashes through stem
- 3slash** 3 slashes through stem
- 4slash** 4 slashes through stem
- 5slash** 5 slashes through stem
- 6slash** 6 slashes through stem
- sprech** X placed on stem
- z** Z placed on stem

The stem.mod attribute is normally used in accordance with practices described in section [4.3.5.3 Tremoland](#).

The CMN module makes the `att.stems.cmn` attribute class available, which adds the optional `stem.with` attribute to `<note>` and `<chord>`. The attribute `stem.with` allows for the indication of a stem that joins notes on adjacent staves.

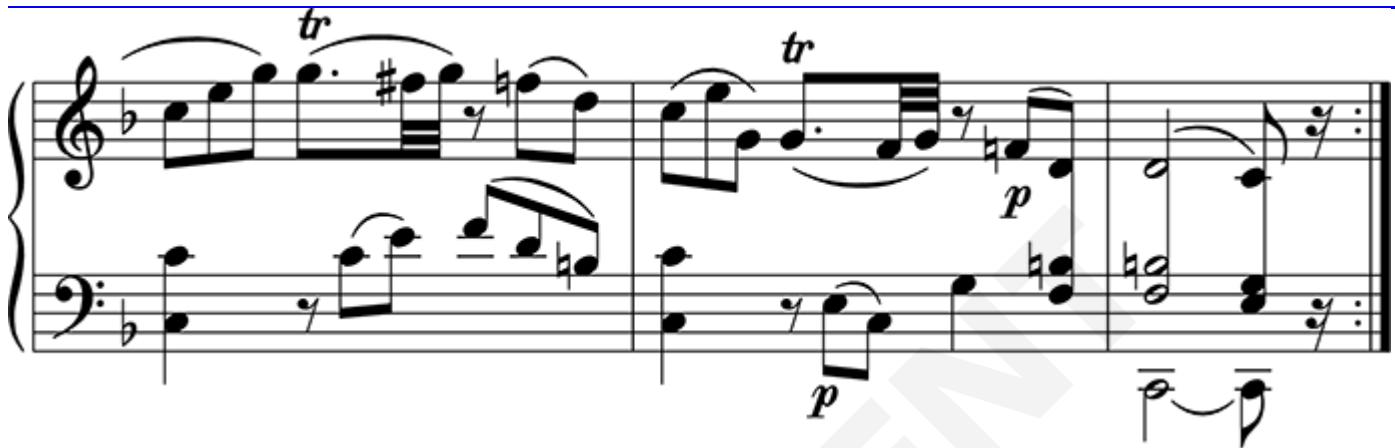

Figure 13. Cross-staff chord

The following code demonstrates one method of encoding the first chord in the last measure in the image above. The `stem.with` attribute must occur on all the notes or chords attached to the cross-staff stem.

```
<measure>
  <staff n="1">
    <layer n="1">
      <note dur="2" oct="4" pname="d" stem.with="below"/>
    </layer>
  </staff>
  <staff n="2">
    <layer n="1">
      <chord dur="2" stem.with="above">
        <note accid="n" oct="3" pname="b"/>
        <note oct="3" pname="f"/>
      </chord>
    </layer>
  </staff>
</measure>
```

Listing 118.

Alternatively, the encoder may choose to treat the notes in the lower staff as logically belonging to the top staff and to 'displace' them using the `staff` attribute on `<note>`. Some use cases, however, may require filling the time that those notes would normally occupy using the `<space>` element described in section 2.2.4.5 Event Spacing. Using this mechanism, the example above could also be encoded like so:

```
<measure>
  <staff n="1">
```

```

<layer n="1">
  <chord dur="2">
    <note oct="4" pname="d"/>
    <note accid="n" oct="3" pname="b" staff="2"/>
    <note oct="3" pname="f" staff="2"/>
  </chord>
</layer>
</staff>
<staff n="2">
  <layer n="1">
    <!-- the time used by the notes on staff 2 filled with non-sounding "space" -->
    <space dur="2"/>
  </layer>
</staff>
</measure>

```

Listing 119.

The choice between these two methods of representing material that crosses staves is often software-dependent.

Whereas `stem.with` can be used to define stems that connect notes across different staves (cross-staff chords) `stem.sameas` is meant for describing a stem that connects two notes pertaining to different layers within the same staff.

The typical scenario for `stem.sameas` is orchestral scores where two wind instruments are notated on one single staff. Normally, the notes have individual stems pointing in opposite directions. However, it is common engraving practice that notes of the same duration are often stemmed together between the parts encoded in separate layers. The following example demonstrates this practice in the wind instruments (bassoons and trumpets in meas. 1 - 3, horns in meas. 3)

The musical score consists of five staves. From top to bottom, the instruments are: Bassoon (Fagotti), Horn (Corni in Mi♭/Es), Clarinet (Clarini in Mi♭/Es), Timpani (Timpani in Mi♭-Si♭/Es-B), and Violin (Violino I and Violino II). The score is in 2/4 time and C major. Dynamics include forte (f), piano (p), and double forte (ff). The bassoon and trumpet parts are shown in separate layers within the same staff, demonstrating the use of `stem.sameas`.

Figure 14. Shared stems

The following code represents an encoding of *shared stems* in the bassoon and trumpet staff using `stem.sameas`.

```

<score>
  <measure n="1">
    <!-- ... -->
    <staff label="Fagotti" n="3">
      <layer n="1" xml:id="L08">
        <note accid.ges="f" dur="2" oct="4" pname="e" tstamp="1" xml:id="note_2754"/>
        <note accid.ges="f" dots="2" dur="4" oct="4" pname="e" tstamp="2" xml:id="note_2757"/>
        <note accid.ges="f" dur="16" oct="4" pname="e" tstamp="2.875" xml:id="note_2760"/>
      </layer>
      <layer n="2" xml:id="L10">
        <note accid.ges="f" dur="2" oct="3" pname="e" stem.sameas="#note_2754" tstamp="1"
          xml:id="note_2766"/>
        <note accid.ges="f" dots="2" dur="4" oct="3" pname="e" stem.sameas="#note_2757"
          tstamp="2" xml:id="note_2769"/>
        <note accid.ges="f" dur="16" oct="3" pname="e" stem.sameas="#note_2760" tstamp="2.875"
          xml:id="note_2772"/>
      </layer>
    </staff>
    <!-- ... -->
    <staff label="Clarini" n="5">
      <layer n="1" xml:id="L15">
        <note dur="2" oct="5" pname="c" tstamp="1" xml:id="note_2808"/>
        <note dots="2" dur="4" oct="5" pname="c" tstamp="2" xml:id="note_2811"/>
        <note dur="16" oct="5" pname="c" tstamp="2.875" xml:id="note_2814"/>
      </layer>
      <layer n="2" xml:id="L17">
        <note dur="2" oct="4" pname="c" stem.sameas="#note_2808" tstamp="1"
          xml:id="note_2820"/>
        <note dots="2" dur="4" oct="4" pname="c" stem.sameas="#note_2811" tstamp="2"
          xml:id="note_2823"/>
        <note dur="16" oct="4" pname="c" stem.sameas="#note_2814" tstamp="2.875"
          xml:id="note_2826"/>
      </layer>
    </staff>
    <!-- ... -->
  </measure>
</score>
```

Listing 120.

#### 4.2.5.3 Rests

The `dur` attribute on `<rest>` captures the written duration of the rest and allows the same values as on `<note>` and `<chord>`. The CMN module also makes three more elements available for special forms of rest:

**<mRest>** Complete measure rest in any meter.

**<multiRest>** Multiple measures of rest compressed into a single symbol, frequently found in performer parts.

**<mSpace>** A measure containing only empty space in any meter.

#### 4.2.5.3.1 Measure Rests

The **<mRest>** (measure rest) element is used to indicate a complete measure rest, independent from the meter of the current

**<measure>**.

The cutout attribute provides for the description of the rendition of the **<mRest>**. If cutout is set to 'cutout' (the only value allowed), then the complete staff including the staff lines will not be rendered for this measure.

```
<staff>
  <layer>
    <mRest cutout="cutout"/>
  </layer>
</staff>
```

Listing 121.

It is a semantic error to mix an **<mRest>** with other events in the same **<layer>**. However, other 'control events', such as **<fermata>**, may be used at the same time as **<mRest>**.

#### 4.2.5.3.2 Multiple-Measure Rests

The **<multiRest>** (multiple measure rest) element is used to encode multiple measures of rest. It is commonly used in performer parts, but due to the problem of synchronicity with other staves, it is never found in scores. A numeric value, stored in the num attribute, indicates the number of resting measures. The older visual forms displayed below (often called *Kirchenpausen*) are not captured by **<multiRest>**, but may be created by rendering software. You may force modern block rests by using the block attribute.

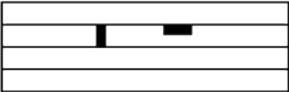

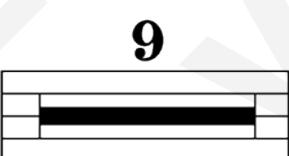

2 measures		double whole-rest in third space
3 measures		two-measure rest plus whole rest
4 measures		two double whole-rests joined as one in second and third spaces
5 measures		four-measure rest plus whole rest
6 measures		four-measure rest plus two-measure rest
7 measures		four-measure rest plus two-measure rest plus whole rest
8 measures		two four-measure rests
9 measures and longer		thick horizontal bar on third line with vertical ends plus large numeral above or below staff

Figure 15. Forms of multiple measure rests

```
<staff>
  <layer>
    <multiRest num="9"/>
  </layer>
```

---

```
</staff>
```

Listing 122.

---

#### 4.2.5.3.3 Empty Measures

The [`<mSpace>`](#) (measure space) element is closely related to the [`<space>`](#) and [`<mRest>`](#) elements. It is used to explicitly indicate that a layer has no content but that no information is missing from the encoding.

Figure 16. Empty measure

---

```
<measure n="2">
  <staff>
    <layer>
      <mSpace/>
    </layer>
  </staff>
</measure>
```

Listing 123.

---

#### 4.2.6 Timestamps and Durations

MEI offers multiple ways of defining onsets and offsets of timed musical events such as notes and slurs. The most common and most musician-friendly approach to this is through the use of a combination of the attributes `tstamp` and `dur`, which are made available by the attribute classes `att.timestamp.log` (inherited by `att.controlEvent`) and `att.timestamp2.log`, both from the shared module.

The timestamp (`tstamp`) of a musical event is calculated in relation to the meter of the current measure and resembles the so-called ‘beat’ position. In a common time measure with four quarter notes, the timestamp of each quarter equals its beat position in the measure: The first quarter has a timestamp of 1, the second has a timestamp of 2, and so on. MEI defines the value of `tstamp` as a real number; the second eighth note position in a measure would thus be represented by the value of "1.5". The range of possible values is defined as starting with zero and ending with the number of metrical units in a measure (the ‘numerator’ in a time signature) + 1. This allows the capture of all graphical positions starting from the left bar line ('0') and ending with the right bar line of the measure ('5', in the case of 4/4 time).

For expressing durations, MEI offers the `dur` attribute. This attribute is described in section [4.2.5.1.1 Basic Usage of Notes in CMN](#).

For 'spanning' elements like slurs, which are members of the `model.controlEventLike` class, it is often more intuitive to record two timestamps – one for the onset of the event and one for its termination. Because the termination of the event may be in a succeeding measure, the second timestamp (`tstamp2`) has a slightly different datatype than the one marking the initiation of the event. Its datatype is constrained to values following the formula " $xm + y$ ", where  $x$  is the number of full measures that this particular feature lasts (or the number of bar lines crossed) and  $y$  is the timestamp in the target measure where the feature ends. The timestamp is expressed using the same logic as described above. For example, a value of "0m+3" in 4/4 time indicates that the element bearing this attribute, a slur for example, ends on beat 3 of the same measure where it started. A value of "1m+1.5" would indicate an end on the second eighth note of the following measure. In 6/8 time, the value "2m+3" means that the feature ends two measures later on the third eighth note.

## 4.3 Advanced CMN Features

Over time, in addition to the basic features of note, chord, and rest, many other symbols have been added to CMN. The following section describes some of these symbols and introduces their handling in MEI.

### 4.3.1 Beams

A very common feature of music from the CMN repertoire is the beaming of eighth or shorter notes. MEI provides two elements for the explicit encoding of features joined by beams.

**<beam>** A container for a series of explicitly beamed events that begins and ends entirely within a measure.

**<beamSpan>** Alternative element for explicitly encoding beams, particularly those which extend across bar lines.

Use of the **<beam>** element is straightforward. The beamed notes, rests, or chords are simply enclosed by the **<beam>** element:

```
<layer>
  <beam>
    <note dur="8"/>
    <note dur="8"/>
  </beam>
</layer>
```

Listing 124.

Whereas in music notation every note value shorter than an eighth adds another beam (sometimes referred to as ‘secondary beams’), in MEI only one beam element is used, no matter the durations of the contained notes. The visual rendition of a set of beamed notes is presumed to be handled by rendering processes.

```
<layer>
  <!-- ... -->
  <beam>
    <note dur="16"/>
    <note dur="32"/>
    <note dur="32"/>
    <note dots="1" dur="16"/>
    <note dur="32"/>
  </beam>
  <!-- ... -->
</layer>
```

Listing 125.

From the 19th century onwards, it became quite common to break secondary beams to increase readability of longer beamed passages. The optional `breaksec` attribute on `<note>`s and `<chord>`s under the beam may be used to encode the breaking of secondary beams *after* the note or chord bearing the attribute. The value of `breaksec` indicates the number of continuous beams. For example:

---

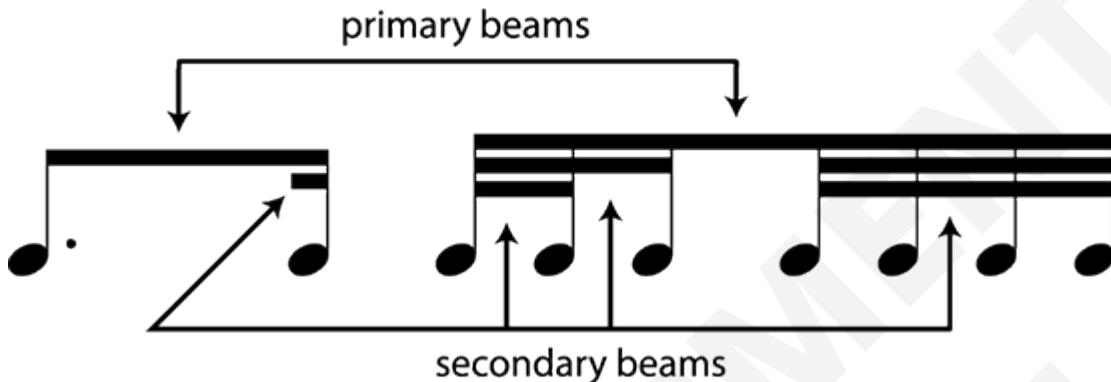

Figure 17. Primary and secondary beams

---

```
<layer>
  <beam>
    <note dots="1" dur="8"/>
    <note dur="16"/>
  </beam>
  <beam>
    <note dur="32"/>
    <note dur="32"/>
    <note breaksec="1" dur="16"/>
    <note dur="32"/>
    <note dur="32"/>
    <note dur="32"/>
    <note dur="32"/>
  </beam>
</layer>
```

Listing 126.

---

In the music of the second half of the 20th century, it is quite common to indicate acceleration or deceleration using converging (feathered) beams as in the image below:

The encoding of such a beam is accomplished using the `form` attribute of the beam, which allows the following values:

**acc** Beams gradually diverge.

**rit** Beams gradually converge (into one).

**mixed** Beams diverge and converge arbitrarily.

**norm** The beam is rendered as usual (default).

```
<layer>
<!-- ... -->
<beam form="acc">
  <note dur="8"/>
  <note/>
  <note/>
  <note/>
  <note/>
  <note dur="32"/>
</beam>
<!-- ... -->
</layer>
```

Listing 127.

The duration of notes, rests, or chords under a beam which carries the form attribute with a value of 'acc', 'rit', or 'mixed' must be treated specially. The first and last contained elements must specify a duration which matches the number of beams displayed at the point of these events. In the case of a 'mixed' beam, each event at the point of change in the number of secondary beams must carry a dur attribute. Beams like this may be encoded thusly:

Figure 18. Feathered beaming

```
<layer>
<!-- ... -->
<beam form="mixed">
  <note dur="8"/>
  <note dur="8"/>
  <note/>
  <note/>
  <note/>
  <note dur="32"/>
</beam>
<beam form="mixed">
  <note dur="32"/>
```

```

<note/>
<note/>
<note/>
<note/>
<note dur="8"/>
<note dur="8"/>
</beam>
<!-- ... -->
</layer>

```

Listing 128.

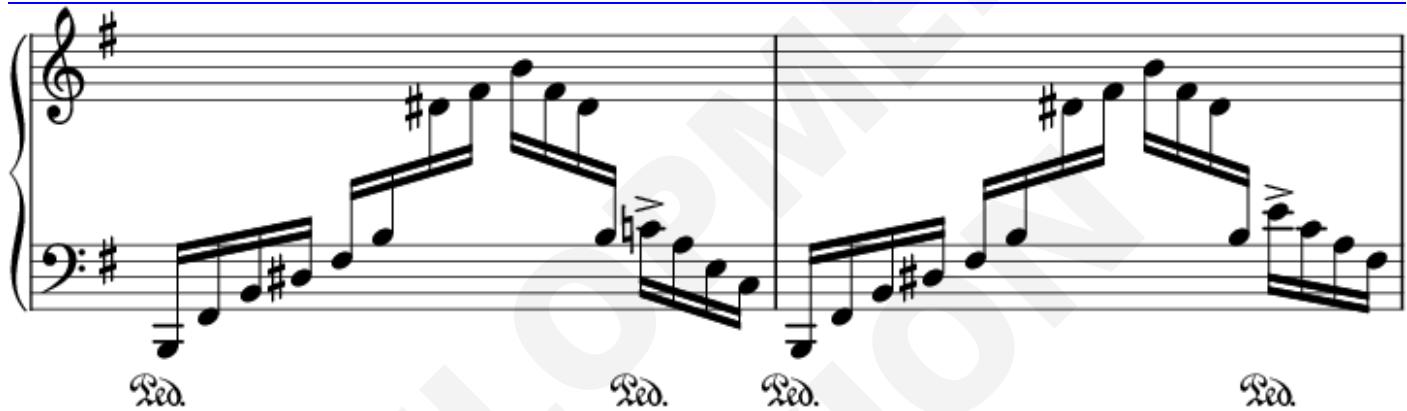

Figure 19. Two measures from No. 4 of Moszkowski's 12 Pianoforte Studies for the left hand

Beams that connect events on different staves may be encoded in two different ways. First, a single-layer approach may be taken that treats the events lying under the beam as logically belonging to the same layer as the initial event but visually 'displaced' to an adjacent staff. In the example above from [Moritz Moszkowski's 12 Pianoforte Studies for the left hand](#), Op. 92, MoszWV 117 this method makes even from a semantic perspective perfect sense. It can be achieved with an additional staff attribute value that contradicts the 'normal' staff placement indicated by the n attribute of their ancestor `<staff>`.

```

<staff n="2">
<layer>
<!-- ... -->
<beam place="mixed">
<note dur="16" oct="3" pname="f" accid.ges="s"/>
<note dur="16" oct="3" pname="b"/>
<note dur="16" oct="4" pname="d" accid="s" staff="1"/>
<note dur="16" oct="4" pname="f" accid.ges="s" staff="1"/>
</beam>
<!-- ... -->
</layer>

```

```
</staff>
```

Listing 129.

In other contexts however, a staff-by-staff methodology may be employed in which the notes are encoded according to the staff on which they appear. This encoding style requires that each `<beam>` element account for the total time encompassed by the beam; that is, each `<beam>` must use one or more `<space>` elements to account for the time occupied by notes on the opposing staff. For example, the time used by the first two notes of the beam must be represented on staff number 1 and the time taken by the last two notes of the beam must be filled on staff number 2.

```
<measure>
  <staff n="1">
    <layer>
      <beam beam.with="below">
        <space dur="8"/>
        <note oct="4" pname="d"/>
        <note pname="f"/>
      </beam>
    </layer>
  </staff>
  <staff n="2">
    <layer>
      <beam beam.with="above">
        <note dur="16" oct="3" pname="g"/>
        <note pname="b"/>
        <space dur="8"/>
      </beam>
    </layer>
  </staff>
</measure>
```

Listing 130.

Downstream processing needs are the determining factor in the choice between the two alternative encoding methods.

Due to the potential problem of overlapping hierarchies, the `<beam>` element only allows the encoding of beams that do not cross bar lines. When beams cross bar lines, the use of the `<beamSpan>` element is required. Unlike `<beam>`, the `<beamSpan>` element does not contain the beamed notes as its children. Instead, it references the `xml:id` values of all affected notes in its `plist` attribute and denotes the initial and terminal notes of the beam using `startid` and `endid` attributes. This configuration allows beams to cross measure boundaries. The following example from [Erwin Schulhoff's Violin Sonata](#) demonstrates a typical example of such hierarchy-crossing beams:

Figure 20. Cross-measure beam in the third movement of Schulhoff's Sonata

```
<beamSpan startid="#note1" endid="#note4" plist="#note1 #note2 #note3 #note4"/>
```

Listing 131.

In addition to the explicit encoding of beams accommodated by the `<beam>` and `<beamSpan>` elements and the `beam` attribute, MEI allows for specification of default beaming behavior using the following attributes on `<scoreDef>`, `<staffDef>`, and `<layerDef>`:

**beam.group** Provides an example of how automated beaming (including secondary beams) is to be performed.

**beam.rests** Indicates whether automatically-drawn beams should include rests shorter than a quarter note duration.

The `beam.group` attribute can be used to set a default beaming pattern to be used when no beaming is indicated at the layer level. It must contain a comma-separated list of time values that add up to a measure in the current meter, e.g., 4,4,4,4 in 4/4 time indicates that each quarter note worth of shorter notes should be beamed together. Parentheses can be used to indicate sub-groupings of secondary beams. For example, (4.,4.,4.) in 9/8 meter indicates one primary beam per measure with secondary beams broken at each dotted quarter duration, while (4,4)(4,4) in 4/4 will result in a measure of 16th notes being rendered with a primary beam covering all the notes and secondary beams for each group of four 16th notes.

The `beam.group` attribute is available on `<scoreDef>`, `<staffDef>`, and `<layerDef>` elements, making it possible to set different beaming patterns for each of these. Also, the beaming pattern can be changed anywhere score parameters may be changed, for example, at the start of sections. This beaming "directive" can be overridden by using `<beam>`, `<beamSpan>`, or `beam` attributes as described above. If none of these beaming specifications is used, then no beaming is implied. Default beaming can be explicitly 'turned off' by setting `beam.group` to an empty string.

### 4.3.2 Ties, Slurs and Phrase Marks

One of the most specific features of CMN is the use of 'curved lines' which connect notes. These lines are used to indicate various musical features, depending on their context.

A tie is a curved line connecting *two* notes of the *same pitch*. The purpose of a tie is to join the durations of both notes, so that the first note sounds for the combined duration. In other words, there is only one onset for both notes.

In MEI, ties can be encoded in different ways, depending on the level of detail that the encoder wants to preserve. The simplest solution is to use the tie attribute found on `<note>` and `<chord>`.

```
<layer>
  <note dur="2" oct="4" pname="f" tie="i"/>
  <note dots="1" dur="4" oct="4" pname="f" tie="t"/>
</layer>
```

Listing 132.

This attribute allows three values:

**i (initial)** Marks the start of a tie

**m (medial)** Marks a participant in a tie other than the first or last

**t (terminal)** Marks the end of a tie

The scope of the tie attribute is the musical `<layer>`; that is, a tie started in one layer may only be ended by a subsequent musical event with a tie attribute with an m or t value in the same layer. The tie-terminating event may lie in the following measure.

Figure 21. Ties across bar lines

```
<measure n="1">
  <!-- staff 1 omitted -->
  <staff n="2">
    <layer n="1">
      <chord dur="16">
        <note oct="2" pname="f"/>
        <note oct="1" pname="f"/>
      </chord>
      <beam>
        <note oct="2" pname="f" tie="i"/>
        <note oct="2" pname="a" tie="i"/>
```

```
<note oct="3" pname="c" tie="i"/>
</beam>
<chord dur="4">
  <note oct="3" pname="f" tie="i"/>
  <note oct="3" pname="c" tie="m"/>
  <note oct="2" pname="a" tie="m"/>
  <note oct="2" pname="f" tie="m"/>
</chord>
</layer>
</staff>
</measure>
<measure n="2">
  <!-- staff 1 omitted -->
<staff n="2">
  <layer n="1">
    <chord dur="16">
      <note oct="3" pname="f" tie="t"/>
      <note oct="3" pname="c" tie="t"/>
      <note oct="2" pname="a" tie="t"/>
      <note oct="2" pname="f" tie="t"/>
    </chord>
    <!-- ... -->
  </layer>
</staff>
</measure>
<!-- measures 3 and 4 omitted -->
```

Listing 133.

When tie is used on chords, it functions as a shorthand indication for multiple tie markings; that is, a separate tie is drawn for every pitch in the chord that remains unchanged in the succeeding chord.

```
<staff>
  <layer>
    <chord dur="4" tie="i">
      <note pname="f"/>
      <note pname="c"/>
      <note pname="a"/>
    </chord>
    <chord dur="4" tie="t">
      <note pname="f"/>
      <note pname="c"/>
      <note pname="a"/>
    </chord>
  </layer>
</staff>
```

Listing 134.

This is equivalent to the following, more verbose version:

```
<staff>
  <layer>
    <chord dur="4">
      <note pname="f" tie="i"/>
      <note pname="c" tie="i"/>
      <note pname="a" tie="i"/>
    </chord>
    <chord dur="4">
      <note pname="f" tie="t"/>
      <note pname="c" tie="t"/>
      <note pname="a" tie="t"/>
    </chord>
  </layer>
</staff>
```

Listing 135.

A slur is a curved line that connects a group of notes of different pitch. It normally indicates that an instrument-specific performance technique should be applied to the affected notes. For example, in notation for winds, the notes should be played in one breath, while a single bow is indicated for string instruments.

Figure 22. Slurs

In MEI, slurs may be encoded in a similar way to ties: `<note>` and `<chord>` bear a slur attribute that allows the commencement or ending of a slur at this element. The allowed values, however, are slightly different: The *i*, *m* or *t* are followed by a single digit in the range 1 to 6, as in the following example:

```
<layer>
  <note accid="s" dur="4" oct="4" pname="f" slur="i1"/>
  <note dur="4" oct="4" pname="g" slur="m1"/>
  <note dur="4" oct="4" pname="a" slur="t1"/>
</layer>
```

Listing 136.

The reason for this difference is that slurs, unlike ties, may overlap, so that a second slur may start while the first slur is still ongoing. The digit indicates the level of nesting of slurs on the note; '1' indicates no nesting, while '2' indicates the existence of 2 slurs in which this note participates, and so on. In the example below, the second

and third quarter notes lie under 2 slurs. The second note is covered by the slur that begins on the preceding note and by the one that it starts. The third note is affected by the slur that begins on note one and by the one that starts on note two.

---

```
<staff>
  <layer>
    <note dur="2" oct="4" pname="g" slur="i1"/>
    <note dur="8" oct="4" pname="a" slur="i2"/>
    <note dur="8" oct="4" pname="g" slur="t2"/>
    <note accid="s" dur="4" oct="4" pname="f" slur="t1"/>
  </layer>
  <layer>
    <note dots="1" dur="2" oct="3" pname="b" slur="i1"/>
    <note dur="4" oct="4" pname="d" slur="t1"/>
  </layer>
</staff>
```

Listing 137.

---

To support analytical operations, slur may take on more than one value. For example, the example above may be more explicitly encoded as:

---

```
<staff>
  <layer>
    <note dur="2" oct="4" pname="g" slur="i1"/>
    <note dur="8" oct="4" pname="a" slur="m1 i2"/>
    <note dur="8" oct="4" pname="g" slur="m1 t2"/>
    <note accid="s" dur="4" oct="4" pname="f" slur="t1"/>
  </layer>
  <layer>
    <note dots="1" dur="2" oct="3" pname="b" slur="i1"/>
    <note dur="4" oct="4" pname="d" slur="t1"/>
  </layer>
</staff>
```

Listing 138.

---

In this encoding, the notes in the beamed group are marked as participating in two slurs – one connecting just the beamed notes and one connecting the first and last notes of the layer. In ‘nested’ slurs like this, the function of the slurs is usually different. Here, the slur connecting the 8th notes indicates legato performance, while the longer slur functions as a phrase mark.

While ties are not normally allowed to cross layers or staves, slurs may. The following example demonstrates how cross-staff slurs may be encoded using the slur attribute:

```

<measure>
  <staff>
    <layer>
      <note dur="4" oct="4" pname="g" slur="i1"/>
      <note dur="8" oct="4" pname="a" slur="m1"/>
      <note dur="8" oct="4" pname="g" slur="m1"/>
      <note accid="s" dur="4" oct="4" pname="f" slur="m1"/>
    </layer>
  </staff>
  <staff>
    <layer>
      <note dots="1" dur="2" oct="3" pname="b"/>
      <note dur="4" oct="4" pname="d" slur="t1"/>
    </layer>
  </staff>
</measure>

```

Listing 139.

Slurs and ties that cross system or page breaks are often split into two separate symbols for rendering. One slur or tie ends at the last bar line, another one starts at the beginning of the new system. MEI expects this to be the default rendering behavior, so that in situations like these, the regular tie or slur attributes are sufficient to describe both curved lines resulting from the split.

Sometimes, however, one of these two symbols is missing in the document, or the encoder wants to provide additional (often visual) information about the slur or tie. In these cases, using an attribute is not an adequate solution. Therefore, MEI offers dedicated `<tie>` and `<slur>` elements. A third element, `<phrase>`, is used to identify a unified melodic idea (in German: *Phrasierungsbogen*), whereas the `<slur>` element is used as a generic element for all curved lines (in German: *Bogensetzung*) except ties. All three elements have nearly identical models.

Another reason for using elements instead of attributes for ties, slurs, and phrase marks is that only elements may be combined with the functionality provided in chapters [11.2 Editorial Markup](#) and [11.1 Critical Apparatus](#) of these Guidelines.

Although these elements are allowed within a `<layer>` to accommodate unmeasured notation, by convention in CMN they are normally placed inside `<measure>`, after the encoding of staves, alongside other so-called ‘control events’.

```

<measure>
  <staff n="1">
    <layer>
      <note dur="4" oct="5" pname="c"/>
      <note dur="4" oct="4" pname="f"/>
      <note dur="4" oct="4" pname="g"/>

```

```
<note dur="4" oct="4" pname="c"/>
</layer>
</staff>
<slur/>
<tempo/>
<dynam/>
</measure>
```

Listing 140.

Obviously, to be complete the slur in the above example needs to be ‘attached’ to the notes somehow. The ‘vertical assignment’ can be indicated for the example above using the staff and layer attributes like so:

---

```
<slur layer="1" staff="1"/>
```

Listing 141.

For the ‘horizontal assignment’, the encoder may choose between two different mechanisms. The first uses two timestamp attributes as described in section [4.2.6 Timestamps and Durations](#). The start and end points of the slur may be indicated thusly:

---

```
<slur layer="1" staff="1" tstamp="1" tstamp2="0m+4"/>
```

Listing 142.

By using tstamp and tstamp2 attributes, the encoder denotes a rather loose connection – the slur (or tie) is attached to a certain position in the measure, not to a specific note or chord. If the encoder wants to specify a close connection to a particular event, the startid and endid attributes may be used instead. Here, the xml:id's of the first and last note of the slur are referenced. This mechanism also allows the crossing of layers and staves.

For human readability, it is recommended to encode `<slur>`, `<tie>` and `<phrase>` features in the `<measure>` where they begin; that is, in the measure that holds the element referenced by startid. On the other hand, for machine processability, it may be desirable to place `<slur>`, `<tie>`, and `<phrase>` elements in the measure *where they end* or even in the *last measure* regardless of their beginning and ending points in the music. This last option makes all references contained within these elements ‘back references’. Back references are necessary when using processing software that treats the encoded file as a stream; that is, programs that process the file without creating an in-memory representation of its contents.

When using the `<tie>`, `<slur>` or `<phrase>` elements, the curvature of the line may be described using the curvedir, bulge and bezier attributes. Whereas the first attribute allows only specification of the slur’s vertical placement, the others give increasingly more precise control of the curve.

If the encoder wishes to draw attention to the appearance of a slur or tie in a given source, the `facs` attribute may be used instead of (or in addition to) the curve description attributes to point to a graphic image or a zone within an image (see [12.1 Facsimiles](#)).

### 4.3.3 Dynamics in CMN

Common Music Notation provides two different methodologies for expressing the volume of a note, phrase, section, etc. The first is a verbal instruction providing such information in human language, possibly in an abbreviated form. An example is the word *piano*, indicating a quiet volume, often abbreviated as *p*. In MEI, verbal instructions like this are encoded using the `<dynam>` element from the Shared module (see chapter [2 Shared Concepts in MEI](#)):

```
<dynam>p</dynam>
```

Listing 143.

By convention, `<dynam>` elements, like `<slur>` and other elements belonging to the `model.controlEventLike` class, are encoded at the end of the `<measure>` to which they belong. This requires `<dynam>` to be assigned to a certain `<staff>` using the `staff` attribute, whose value refers to the target element's `n` attribute. In the absence of other information, all layers within the staff are assumed to have the same dynamic marking.

```
<dynam staff="1" tstamp="1">p</dynam>
```

Listing 144.

However, when the layers of a staff have different dynamic indications, the `layer` attribute may be used to associate a dynamic marking with a particular layer:

```
<measure>
  <dynam layer="1" tstamp="1">p</dynam>
  <dynam layer="2" tstamp="1">mf</dynam>
</measure>
```

Listing 145.

A suitable MIDI value may be assigned to a dynamic marking using the `val` attribute:

```
<dynam layer="1" place="above" staff="2" tstamp="1" val="84">f</dynam>
```

Listing 146.

The location of a dynamic marking in relation to a staff may be specified using the place attribute, which may be given as above, within, or below the staff:

---

```
<dynam place="above" staff="1" tstamp="1">p</dynam>
```

Listing 147.

---

Dynamics must also be associated with a particular time point in a measure, using the tstamp, or with a particular event, using the startid attribute. Linking a control event with measures and events is discussed in section [4.2.6 Timestamps and Durations](#):

---

```
<measure>
  <staff n="1">
    <!-- content omitted -->
  </staff>
  <staff n="2">
    <layer n="1">
      <note dur="2" oct="4" pname="c" stem.mod="2slash"/>
      <note dur="2" oct="4" pname="e" stem.mod="2slash"/>
    </layer>
    <layer n="2">
      <!-- content omitted -->
    </layer>
  </staff>
  <dynam layer="1" place="above" staff="2" tstamp="1">p</dynam>
  <dynam layer="1" place="above" staff="2" tstamp="2.5">cresc. poco a poco</dynam>
</measure>
```

Listing 148.

---

Dynamics which do not have an explicit endpoint are often referred to as 'instantaneous'. On the other hand, some dynamic directions indicate a continuous change that must have a defined end point. It is possible to specify the logical scope of continuous dynamic marks using the attributes tstamp2, dur, dur.ges, or endid. Additionally a corresponding ending value for MIDI output may be given in the val2 attribute.

To capture the fact that the *crescendo* in the example above continue until the first beat of the next measure, they may be marked:

---

```
<!-- using the tstamp2 attribute -->
<dynam place="above" staff="2" tstamp="2.5" tstamp2="1m+1">cresc. poco a poco</dynam>
```

Listing 149.

---

```
<!-- using the endid attribute -->
<dynam endid="#ID_of_ending_note" place="above" staff="2" tstamp="2.5">cresc. poco a
poco</dynam>
```

Listing 150.

Any combination of tstamp, startid, tstamp2, and endid attributes may be used to define the scope of a dynamic, although the tstamp and tstamp2 or the startid and endid combinations are the most logical combinations. For example, the following alternatives are all possibilities for encoding up a crescendo. The choice of attributes is often task or processor dependent.

```
<!-- tstamp attribute indicates starting point, dur attribute marks the end -->
<dynam place="above" staff="2" tstamp="3" dur="1">cresc. poco a poco</dynam>
```

Listing 151.

```
<!-- tstamp attribute indicates starting point, endid attribute marks the end -->
<dynam endid="#ID_of_last_note" place="above" staff="2" tstamp="3">cresc. poco a poco</dynam>
```

Listing 152.

```
<!-- startid attribute indicates starting point, tstamp2 attribute marks the end -->
<dynam place="above" staff="2" startid="#ID_of_first_note" tstamp2="1m+3">cresc. poco a
poco</dynam>
```

Listing 153.

```
<!-- startid attribute indicates starting point, endid attribute marks the end -->
<dynam endid="#ID_of_last_note" place="above" staff="2" startid="#ID_of_first_note">cresc. poco
a poco</dynam>
```

Listing 154.

All musical elements affected by the `<dynam>` may be explicitly specified using the `plist` attribute, which contains `xml:id` attribute value references:

```
<dynam endid="#note4" place="above" plist="#note1 #note2 #note3 #note4" staff="2"  
startid="#note1">cresc. poco a poco</dynam>
```

Listing 155.

---

It is recommended that the list of references in plist include all participants in the dynamic marking, including the first and last notes as in the preceding example, even though they are duplicated by startid and endid attributes.

In addition to verbal instructions, Common Music Notation uses graphical symbols to indicate ‘continuous’ dynamics. These crescendo and decrescendo (or diminuendo) symbols are encoded in MEI using the `<hairpin>` element. It also is a member of the `model.controlEventLike` class, which means it too is used just before the close of a `<measure>` element, following the encoding of all staves. The required attribute form specifies the direction of the symbol by taking one of two possible values: cres (growing louder) or dim (getting softer).

---

```
<hairpin form="cres"/>
```

Listing 156.

---

Marking the logical extent of hairpins is possible using the same attributes as for `<dynam>`.

---

```
<hairpin form="cres" layer="1" place="above" staff="2" tstamp="2.5" tstamp2="1m+1"/>
```

Listing 157.

---

The following example from Béla Bartók’s *Mikrokosmos*, Sz.107 shows a *diminuendo* between two staves that begins on the first beat (in the current measure) and ends on the first one in the penultimate measure. The duration is highlighted with a dashed line, which can be indicated with the extender attribute.

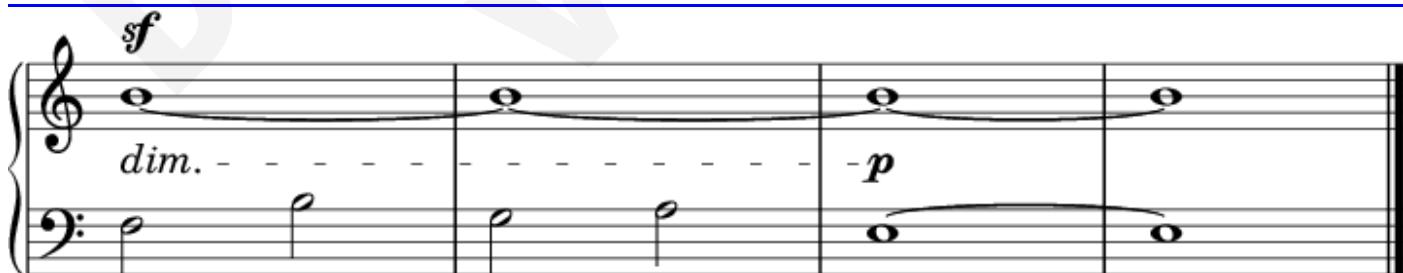

Figure 23. A diminuendo in Bartók’s In Phrygian Mode

---

```
<dynam tstamp="1" tstamp2="2m+1" extender="true" place="between" staff="1 2">dim.</dynam>
```

Listing 158.

#### 4.3.4 Tuples

Tuples indicate a localized change of meter; that is, a given duration in the regular meter is divided between a group of notes with irregular (according to the current meter) rhythmic values. The most common tuple is a so-called 'triplet', in which three notes take the time normally occupied by two.

The relation of the tuple to the underlying meter is specified using the num and numbase attributes, where num specifies the number of replacing notes and numbase specifies the number of notes *of the same duration* to be replaced. For example, when three eighth notes replace one quarter note in common time, num takes a value of "3", whereas numbase reads "2", because a quarter note in common time is normally divided into two eighths. When three quarters replace two in the same meter, numbase also reads "2". The combination of these attributes may be read as "3 in the time of 2" in either case.

Figure 24. Tuple rhythms from Maurice Ravel's Boléro

```
<tuplet num="3" numbase="2">
  <note dur="16"/>
  <note dur="16"/>
  <note dur="16"/>
</tuplet>
```

Listing 159.

The duration of the entire tuple may be encoded using the usual 'power of 2' values, e.g., 1, 2, 4, etc., in the dur attribute if necessary.

```
<layer>
  <tuplet dur="2" num="3" numbase="2">
    <note dur="4" oct="4" pname="g"/>
    <note accid="s" dur="4" oct="4" pname="f"/>
    <note dur="4" oct="4" pname="g"/>
  </tuplet>
  <note dur="2" oct="4" pname="d"/>
```

```
</layer>
```

---

#### Listing 160.

---

Tuplets are often highlighted using brackets above or below the affected notes. The presence and position of these brackets can be encoded using the bracket.place (above / below) and bracket.visible (true / false) attributes.

Usually, however, tuplets are rendered with a bracket (bracket.visible="true") and a single number (num.format="count" and num.visible="true"), as seen in the example above. However, the number-to-numbase ratio may be provided in addition to, or in some cases as a replacement for, the bracket. The num.format attribute indicates whether a plain number (the value of num) or a ratio (comprised of num and numbase, e.g., "3:2") should be displayed and num.visible indicates the general presence of such a number.

Further visual control comes with the num.place and bracket.place attributes, that allow specific placement of the number and the bracket above or below the staff.

In addition to `<note>` elements, `<tuplet>` may contain other elements, such as `<rest>` or `<space>`, to match the content of a source document or an intended rendering. In particular, the `<beam>` element is allowed so that custom beaming may be indicated, e.g., a septuplet may be divided into a group of three plus a group of four notes.

The `<tuplet>` element may also be used for repetition of the same pitch; that is, a single note or chord may be the only content of the tuplet. In some cases, optical music recognition software may treat these instances as bowed tremolandi due to the knowledge of the complete semantics of the notation at the time of recognition. However, marking these as tuplets is the recommended practice.

In some situations, a tuplet is made up of events in different measures. As this raises the issue of non-concurrent hierarchies, it is not possible to encode such situations with the `<tuplet>` element described above. Therefore, MEI offers the `<tupletSpan>` element, which is member of the `model.controlEventLike` class. It is nested inside of `<measure>`, following all the measure's `<staff>` children. It uses the same attributes as `<tuplet>` to describe tuplets, but instead of nesting all affected notes inside itself, it references the `xml:id` values of all affected notes in its `plist` attribute and the initial and terminal notes of the tuplet using `startid` and `endid` attributes. This configuration allows tuplets to cross beams or measure boundaries. The following example demonstrates a typical example of such hierarchy-crossing tuplets:

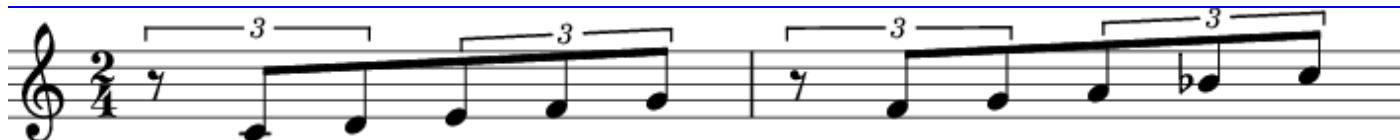

Figure 25. Hierarchy-crossing tuplets

---

```
<tupletSpan num="3" numbase="2" startid="#rest" endid="#note2" plist="#rest #note1 #note2"/>
```

Listing 161.

### 4.3.5 Articulation and Performance Instructions in CMN

This section introduces elements and attributes which may hold CMN-specific performance instructions. The functionality described herein is related to the artic attribute and [the artic element](#) introduced in [2 Shared Concepts in MEI](#). The following elements are relevant in this context:

**<arpeg>** Indicates that the notes of a chord are to be performed successively rather than simultaneously, usually from lowest to highest. Sometimes called a "roll".

**<bend>** A variation in pitch (often micro-tonal) upwards or downwards during the course of a note.

**<bTrem>** A rapid alternation on a single pitch or chord.

**<fermata>** An indication placed over a note or rest to indicate that it should be held longer than its written value. May also occur over a bar line to indicate the end of a phrase or section. Sometimes called a 'hold' or 'pause'.

**<fTrem>** A rapid alternation between a pair of notes (or chords or perhaps between a note and a chord) that are (usually) farther apart than a major second.

**<gliss>** A continuous or sliding movement from one pitch to another, usually indicated by a straight or wavy line.

**<octave>** An indication that a passage should be performed one or more octaves above or below its written pitch.

#### 4.3.5.1 Arpeggio and Glissando

In CMN, the notes of a chord are sometimes performed successively rather than simultaneously. This behavior, called arpeggiation, is normally indicated using a vertical wavy line preceding the chord. MEI offers the [<arpeg>](#) element to describe arpeggios. This element is a member of the [model.controlEventLike.cmn](#) class and, like other members of this class, uses the staff, layer and tstamp or the startid and plist attributes to connect it to the affected chord.

```
<measure>
  <staff n="1">
    <!-- content omitted -->
  </staff>
  <staff n="2">
    <layer>
      <note dur="4"/>
      <note dur="4"/>
```

```

<chord dur="4">
  <!-- notes omitted -->
</chord>
<note/>
</layer>
</staff>
<arpeg staff="2" tstamp="3"/>
</measure>

```

Listing 162.

For arpeggios that involve chords spanning multiple staves as a continuous arpeggio (instead of two separate arpeggios), the plist attribute should be used to point to all affected `<chord>` and single `<note>` elements' xml:id attributes. Therefore, the use of the plist attribute is sufficient in many cases, so that other attributes from above may be omitted.

Figure 26. Spanning arpeggios in Liszt's Mazeppa study

```

<arpeg xml:id="ex-0149852838" plist="#ex-0731379794 #ex-1553574041"/>
<arpeg xml:id="ex-1483377242" plist="#ex-1474174387 #ex-0553655856"/>

```

Listing 163.

The usual direction for the performance of an arpeggio is from lowest note to highest, but this is not always the case. The customary signal of an downward arpeggio is an arrowhead added to the bottom of the wavy line. The indication of the presence of an arrowhead and the direction of the arpeggio are handled separately, however. The arrow attribute indicates the presence of an arrowhead in the arpeggiation sign, while the order attribute records the preferred sequence of notes. Béla Bartók uses a wavy line behind the chord to indicate a downward arpeggio. In such cases, the ho attribute can be used to indicate the offset from the usual position.

The following examples illustrate various ways in which the arrow and order attributes may be employed. The default visual rendition and performance are assumed in the absence of both attributes, while the typical downward arpeggio is indicated by the presence of both attributes. The last two possibilities occur less frequently, but are sometimes appropriate: The presence of the arrow attribute without the order attribute may be used in those cases where the arrowhead is redundant but is added to the symbol for the sake of consistency or when the direction of successive arpeggios changes frequently. The last possibility, an order attribute without an arrow attribute, is ambiguous; however, it can be used as an encoding shortcut since a downward arpeggio must have a visual indication of its direction to distinguish it from the upward arpeggio; therefore, the presence of the arrowhead can be implied.

```
<!-- default visualization and performance -->
<arpeg staff="2" tstamp="3"/>
```

Listing 164.

```
<!-- downward arpeggio with arrow added to visual symbol -->
<arpeg arrow="true" order="down" staff="2" tstamp="3"/>
```

Listing 165.

```
<!-- default rendition with (redundant) arrow added to the top of the visual symbol -->
<arpeg arrow="true" staff="2" tstamp="3"/>
```

Listing 166.

```
<!-- downward arpeggio with no visual indication of order -->
<arpeg order="down" staff="2" tstamp="3"/>
```

Listing 167.

A third, and somewhat counter-intuitive, value for order, nonarp, indicates that no arpeggio shall be performed. Normally rendered as a bracket instead of a wavy line, this form of arpeggio is used to indicate a non-arpeggiated chord intervening in a sequence of arpeggiated ones. This is common in music for the harp, where arpeggiation is the usual method of performing chords and deviation from the norm must be explicitly indicated.

Whereas an arpeggio ‘staggers’ the onset times of the notes of a chord, a glissando denotes a situation where the pitch ‘slides’ from one note to another. It makes no difference whether this slide produces distinct intermediate pitches (as on the piano) or not (as on the trombone), though the latter is sometimes referred to as portamento. The visual appearance of a glissando, which MEI encodes as `<gliss>`, is normally a line connecting two notes in the glissando.

Figure 27. A simple glissando in Tárrega’s Alborada from a leading grace note

---

```
<gliss startid="#startgliss" endid="#endgliss"/>
```

Listing 168.

---

The `<gliss>` element is a member of the `model.controlEventLike` class and therefore, like other control events, it occurs inside a measure after the staves and uses its staff, layer, tstamp, tstamp2, startid and endid attributes to connect it to the affected notes or chords. It is a semantic error not to specify a starting point attribute. The visual appearance of the indicating line may be recorded in the `line.form` and `line.width` attributes.

#### 4.3.5.2 Bend

A bend is a variation in pitch (often microtonal) upwards or downwards during the course of a note. Typically, the performer attacks the note at ‘true’ pitch, changes the intonation, then returns to true pitch. The `<bend>` element can also be used for so-called scoop, plop, falloff, and doit performance effects. It should *not* be used for laissez vibrer (l.v.) indications. As with other elements in the `model.controlEventLike` class, the starting point of the bend may be indicated by either a `tstamp`, `tstamp.ges`, `tstamp.real` or `startid` attribute. It is a semantic error not to specify a starting attribute.

#### 4.3.5.3 Tremolandi

CMN has two slightly different concepts which are both called tremolo. The first is a rapid repetition of a single pitch or chord, whereas the second is a rapid alternation between two different notes or chords. In addition, either species of tremolo may be measured or unmeasured. A measured tremolo is an abbreviation for written-out notation; that is, the tremolo is intended to be perceived as notes with distinct rhythmic values. On the other hand, in an unmeasured tremolo no specific number of alternations is intended.

For the repetition of a single note or chord, MEI offers the `<bTrem>` (bowed tremolo) element, which is a member of the `model.eventLike.cmn` class, meaning it is encoded following the normal course of musical events within a `<layer>`. It holds exactly one `<note>` or `<chord>` element that is to be repeated.

Figure 28. Bowed tremolandi in Schubert's last string quartet

```

<layer>
  <bTrem unitdur="32">
    <note dur="2" oct="4" pname="e" stem.mod="3slash">
      <accid accid="n"/>
    </note>
  </bTrem>
  <bTrem unitdur="32">
    <chord dur="4" stem.mod="3slash">
      <note oct="4" pname="e"/>
      <note oct="4" pname="d">
        <accid accid="s"/>
      </note>
    </chord>
  </bTrem>
  <bTrem unitdur="32">
    <chord dur="4" stem.mod="3slash">
      <note oct="4" pname="e"/>
      <note oct="4" pname="c">
        <accid accid="s"/>
      </note>
    </chord>
  </bTrem>

```

```
</note>
</chord>
</bTrem>
</layer>
```

---

#### Listing 169.

---

The unitdur attribute value indicates the exact note values in an aural rendition of a measured tremolo, i.e., quarters, 8ths, and so on. The stem.mod attribute must also be explicitly set on the child `<note>` or `<chord>` element for a complete visual representation. The example above shows a short excerpt from the second movement of [Franz Schubert's String Quartet in G major, D. 887](#).

However, the number of slashes present on the note may disagree with the number of slashes that should be present according to the unitdur attribute, especially in music manuscripts.

---

```
<bTrem unitdur="64">
  <note dur="4" oct="4" pname="g" stem.mod="2slash"/>
</bTrem>
```

---

#### Listing 170.

---

Note that within beams the number of slashes should be adjusted anyway.

---

```
<beam>
  <bTrem unitdur="32">
    <note dots="1" dur="8" oct="4" pname="b" stem.mod="2slash"/>
  </bTrem>
  <bTrem unitdur="32">
    <note dots="1" dur="16" oct="4" pname="b" stem.mod="1slash"/>
  </bTrem>
</beam>
```

---

#### Listing 171.

---

The `<bTrem>` element can be used as shorthand for a tuplet consisting of repetitions of a single note or chord. This kind of markup may be the result of an optical music recognition process in which complete semantics cannot be determined *a priori*. When used this way, the num attribute on `<bTrem>` can record a number to be rendered along with the pseudo-tuplet. In spite of this capability, the `<tuplet>` element is preferred. This makes the following examples' visual appearance equal, but not necessarily their semantics.

```
<bTrem num="3">
  <note dur="4" oct="4" pname="g" stem.mod="3slash"/>
</bTrem>
```

Listing 172.

```
<tuplet num="3" numbase="2">
  <bTrem>
    <note dur="4" oct="4" pname="g" stem.mod="3slash"/>
  </bTrem>
</tuplet>
```

Listing 173.

In the case of alternating pitches, MEI offers the `<fTrem>` (fingered tremolo) element. While it mostly behaves the same as `<bTrem>`, a fingered tremolo requires exactly two child elements, either being a `<note>` or `<chord>`. The unitdur attribute value indicates the exact note values in an aural rendition of a measured tremolo, i.e., 4ths, 8ths, 16ths, etc. The number of beams present in the source is captured by the beams attribute.

Figure 29. Fingered tremolos

```
<fTrem unitdur="32">
  <note pname="f" oct="4" dur="4"/>
  <note pname="a" oct="4" dur="4"/>
</fTrem>
```

Listing 174.

Similar to `<bTrem>`, here the number of beams present may disagree with the rhythmic value indicated by the unitdur attribute, especially in manuscript sources. The number of so-called ‘floating’ beams, which are not attached to stems, may be encoded in the beams.float attribute.

Figure 30. Tremolos with floating beams

#### 4.3.5.4 Fermata

A very common feature of music notation from the CMN period is the so-called ‘fermata’ (or ‘corona’ in Italian). It is usually written as a dot above or below an arc. It may stand above or below the staff it affects with its ‘open’ side usually facing towards the staff. A fermata indicates that a related note or rest should be held longer than its written duration would normally require. Sometimes, a fermata occurs over or under a bar line to indicate a pause or even the end of a phrase or section.

Figure 31. The probably most famous fermatas in history from Beethoven’s fifth symphony

In MEI, fermatas may be encoded using an attribute on elements like `<note>`, `<chord>` or `<rest>`. This attribute allows placement of a fermata above or below the element to which it’s attached.

Figure 32. Fermatas in Mozart’s String quartet K. 428 indicating general pauses

```
<mRest fermata="above"/>
```

Listing 175.

However, if there is further (visual) information about the fermata that should be addressed in the encoding, MEI offers the `<fermata>` element. This element, which is a member of the `model.controlEventLike.cmn` class and therefore requires the use of such attributes as `staff`, `layer`, `tstamp` and `startid`, allows specification of the ori-

tation of the fermata using its form attribute. In addition, the shape attribute may be used to indicate whether

the fermata is rendered as the common semicircle ("curved"), a semisquare ("square"), or a triangle ("angular"). If the fermata should be rendered using some other symbol, a user-defined symbol may be referred to using an altsym attribute or the glyph.name and glyph.num attributes respectively.

```
<fermata form="inv" place="above" shape="square" staff="2" tstamp="4"/>
```

Listing 176.

```
<fermata altsym="#myFermata.1" place="above" staff="2" tstamp="5"/>
```

Listing 177.

#### 4.3.5.5 Octave Shift

An indication that a passage should be performed one or more octaves above or below its written pitch is represented by the `<octave>` element.

The image displays three staves of musical notation. Staff 1 (top) shows a melodic line with several fermatas. Above the first fermata is an '8' indicating an octave shift. Above the second fermata is another '8'. Above the third fermata is a '1'. Staff 2 (middle) shows a bass line with measures numbered 6, 15, 8, and 8. Above the first measure is a '6'. Above the second measure is a '15'. Above the third measure is an '8'. Above the fourth measure is another '8'. Staff 3 (bottom) shows a melodic line starting at measure 11. Above the first measure of staff 3 is an '8'.

```

  </staff>
</measure>
</section>
```

---

Listing 178.

Its dis and dis.place attributes record the amount and direction of displacement, respectively. The lform attribute captures the appearance of the continuation line associated with the octave displacement. The starting point of the octave displacement may be indicated by either a tstamp, tstamp.ges, tstamp.real or startid attribute, while the ending point may be recorded by either a tstamp2, dur, dur.ges or endid attribute. It is a semantic error not to specify one starting-type attribute and one ending-type attribute.

### 4.3.6 Instrument-specific Symbols in CMN

CMN contains a number of symbols which are closely related to a specific instrument. MEI offers elements for three of these symbols, namely breath marks, harp pedal diagrams, and piano pedals.

#### 4.3.6.1 Breath Marks

A breath mark indicates a point at which the performer of a wind instrument or singer may breathe. It is sometimes also used to indicate a short pause or break for instruments *not* requiring breath, which allows it to also serve as a guide to phrasing. In MEI, breath marks are encoded using the `<breath>` element, which is a member of [model.controlEventLike.cmn](#). It is a semantic error not to specify a starting point attribute.

```

<measure>
  <staff n="1">
    <layer>
      <note dur="2" oct="3" pname="g" syl="Wald," />
      <note dur="4" oct="3" pname="c" syl="so"/>
    </layer>
  </staff>
  <breath staff="1" tstamp="1.5" />
</measure>

```

Listing 179.

The usual sign for the breath mark is a comma; however, other visual forms of the breath mark may be indicated using the altsym attribute (see chapter [2.4 User-defined Symbols](#) for further details).

### 4.3.6.2 Harp Pedals

Modern harps have seven pedals which allow adjustment of their strings to different pitches. The settings for these pedals occur at the beginning of the harp notation and/or whenever it is necessary to change the harp's tuning. These settings may be rendered using letter pitches (in the order of the pedals from left to right) or in a diagrammatic fashion, such as the form invented by [Carlos Salzedo](#).

In MEI, harp pedal settings are encoded using the `<harpPedal>` element. It is a member of the `model.controlEventLike.cmn` class and is therefore placed within `<measure>`, following all `<staff>` children. The staff and layer attributes may be used to assign it to a certain `<staff>` or `<layer>`. Either a tstamp or startid attribute must be used to indicate the placement within the measure (see [4.2.6 Timestamps and Durations](#) and [13 Linking Data](#) for further details about those linking mechanisms).

The musical intention of the element is described using the c, d, e, f, g, a and b attributes, which affect the corresponding strings of the harp. All of these attributes may take the values f (flat), s (sharp) or n (natural), where a natural is the default value, which is assumed when one of these attributes is not specified.

Figure 33. Harp pedal diagrams

```

<measure>
  <!-- staves omitted -->
  <harpPedal tstamp="1" c="s" b="f" e="f" />

```

```
</measure>
```

Listing 180.

---

In the first diagram of the preceding example, the B, and E pedals are in the flat position, while the C pedal is in sharp position. The other, non-specified pedals are in the natural position.

#### 4.3.6.3 Piano Pedal

Music for piano also often includes indications of the use of pedals. In MEI, these symbols are encoded using the `<pedal>` element. As a member of the `model.controlEventLike.cmn` class, it is located within `<measure>` and refers to a staff, layer and timestamp using the staff, layer and tstamp attributes. Alternatively, the startid attribute may be used to identify a `<note>` or `<chord>` to which the mark should be assigned.

The meaning of the mark is captured using the dir attribute, which provides the following values:

- down** depress the pedal
  - up** release the pedal
  - bounce** release, then immediately depress the pedal again
  - half** depress the pedal half way
- 

```
<measure>
  <!-- staves omitted -->
  <pedal dir="down" staff="2" tstamp="1"/>
</measure>
```

Listing 181.

---

To specify the pedal, that has to be used, the func attribute allows the following values:

- sustain** The sustain pedal, also referred to as the "damper" pedal, allows the piano strings to vibrate sympathetically with the struck strings. It is the right-most and the most frequently used pedal on modern pianos. (Often marked with: )
- soft** The soft pedal, sometimes called the "una corda", "piano", or "half-blow" pedal, reduces the volume and modifies the timbre of the piano. On the modern piano, it is the left-most pedal.

**sostenuto** The sostenuto or tone-sustaining pedal allows notes already undamped to continue to ring while other notes are damped normally; that is, on their release by the fingers. This is usually the center pedal of the modern piano. (Often marked with: 

**silent** The silent or practice pedal mutes the volume of the piano so that one may practice quietly. It is sometimes a replacement for the sostenuto pedal, especially on an upright or vertical instrument.

#### 4.3.6.4 Fingering

A common feature for keyboard music is fingering, indicating the finger, which should be used to play a single note. Basic fingering can be encoded in MEI using the `<fing>` element, which is a member of the `model.fingeringLike` class, and thus part of the `model.controlEventLike` class.

The following example, taken from Charles-Louis Hanon's *Le Pianiste virtuose*, shows typical fingering:

Figure 34. Fingering in Hanon's exercise no. 21

```
<fing startid="#ex_2099285249" place="above">1</fing>
```

Listing 182.

```
<fing startid="#ex_0938118303" place="below">5</fing>
```

Listing 183.

### 4.3.7 Ossia

The term ossia, Italian for "or", denotes an alternative for a certain passage which is provided by the composer *without any preference* of one alternative over another. An ossia often provides a simpler (easier to perform) version of the original content. Another frequent use case for ossia is the provision of indications about performance practice, such as an alternative version with ornamentation written out in full. In all cases, it is up to the performer to choose between the alternatives.

Most often an ossia is rendered above the main staff on a reduced-size staff. Sometimes, however, the alternate material occurs on the same staff as the primary text, but in a separate layer. In this case, the alternative material is usually rendered in small-sized notation on the normal-sized staff. For both situations, MEI offers the `<ossia>` element, which may be nested either inside `<measure>` to reflect an ossia on a separate staff, or inside `<staff>` to reflect an inline ossia in a separate layer. The following example demonstrates an ossia on a separate staff:

---

```
<measure>
  <staff n="1">
    <!-- first staff, without ossia -->
  </staff>
  <ossia>
    <staff>
      <!-- alternative content on reduced-size staff -->
    </staff>
    <staff n="2">
      <!-- original content on regular staff -->
    </staff>
  </ossia>
  <staff n="3">
    <!-- third staff, without ossia -->
  </staff>
</measure>
```

Listing 184.

---

The example above demonstrates that only one of the two `<staff>` elements within `<ossia>` has an `n` attribute. This mechanism allows one to distinguish between the "regular" and the "alternative" content: The one bearing the `n` attribute goes in line with the preceding measure's staff, the other one is printed in reduced size above. In this case, the vertical order of staves follows document order: The top-most staff is encoded as the first child, the lowest comes last. In combination with the presence of the `n` attribute, this allows the capture of multiple simultaneous ossia staves.

All staves within `<ossia>`, even the alternative ones without a direct reference, obey the definitions of the associated `<staffDef>`, which can be derived from the value of the `n` attribute. Alternatively, a separate `<staffDef>` may be given at the beginning of the contained `<layer>` element(s).

In case of an inline ossia, the whole setup of elements moves down one step in the hierarchy, as seen in the following example:

```

<measure>
  <staff n="1">
    <!-- content omitted -->
  </staff>
  <staff n="2">
    <ossia>
      <layer n="1">
        <!-- original content in regular layer -->
      </layer>
      <layer>
        <!-- alternative content in separate layer -->
      </layer>
    </ossia>
  </staff>
  <staff n="3">
    <!-- content omitted -->
  </staff>
</measure>

```

Listing 185.

#### 4.3.8 Cue

Cue notes are smaller notes that usually occur in an orchestral or vocal part and are not to be played or sung by the corresponding musician, but by other instruments or singers. Cue notes are used for orientation, i.e., to follow the music during longer pauses and to find the correct re-entry point more easily. In MEI the cue attribute is available to indicate such notes.

```

<rest dur="8" cue="true"/>
<note dur="4" oct="5" pname="f" cue="true"/>

```

Listing 186.

Most often cue notes occur in a group rather than one by one. This is because usually a whole layer of another part is inserted as a cue. Therefore, a complete `<layer>` can also be marked as cue.

The image shows a musical score page with a title "Langsam, marschmäßig" at the top. Below the title, there is a dynamic marking "pp m.v. legato, ma un poco marc." followed by a crescendo/decrescendo dynamic symbol. The score consists of two staves: a bassoon (Fag.) staff and a violin (Vcl.) staff. The bassoon staff has a bass clef, a key signature of four flats, and a common time signature. The violin staff has a treble clef, a key signature of one flat, and a common time signature. There are several small, isolated notes on the bassoon staff, which are identified as cue notes. The bassoon part is labeled "Fag. Vcl. K.-B." at the bottom of its staff.

Figure 35. Cue notes in the flute part of Brahms' *Ein deutsches Requiem*.

          <note dur="4" oct="2" pname="f"/>
        </layer>
      </staff>
    </measure>
    <measure n="2">
      <staff n="1">
        <layer n="1">
          <rest dur="4"/>
          <rest dur="4"/>
          <clef shape="G" line="2"/>
          <note dur="4" oct="5" pname="b" accid.ges="f"/>
        </layer>
        <layer n="2" cue="true">
          <note dur="2" oct="2" pname="b" accid.ges="f"/>
        </layer>
      </staff>
    </measure>
  </section>
</score>
```

Listing 187.

If the voice from which the cue notes originate is also encoded, they should refer to their sounding counterpart with the `corresp` attribute.

Cue notes must not be confused with other small notes such as grace notes or [fiorituras](#).

### 4.3.9 Directives and Rehearsal marks

In CMN scores, there is often a large number of natural language instructions. Some of them concern the loudness and the speed of the performance, in which case MEI offers the elements `<dynam>` (described at [4.3.3 Dynamics in CMN](#)) and `<tempo>`. In other cases, however, they provide other instructions for the performer. Instead of providing separate elements for all possible types of such directions, MEI offers the generic `<dir>` element. Although this element is not CMN specific (it is defined in [2 Shared Concepts in MEI](#)), it is frequently used in this repertoire.

#### 4.3.9.1 Tempo changes and other directives

A tempo or character indication is often provided above the topmost staff of the first measure of a score, movement, or section. This indication, such as "Allegro moderato" or "Andante maestoso", may be regarded as a label. Though it is possible to label the movement, etc. using a `label` attribute attached to the enclosing structural entity (that is, on `<mdiv>` or `<section>`), it is often required to capture the exact position, spelling, or other features of the label as found in the underlying source material. In these cases, an element is necessary.

Labels which address the tempo at which the music should be performed should be encoded using the `<tempo>` element, which is a specialized form of `<dir>`. `<tempo>` is a member of the `model.controlEventLike` class and as such occurs as a child of `<measure>`, following all `<staff>` children. Its `staff`, `layer` and `tstamp` attributes are used to ensure correct semantic positioning, and `place` indicates a visual position with respect to the staff.

```
<measure n="1">
  <!-- all staves omitted -->
  <tempo place="above" staff="1" tstamp="1">Allegro moderato</tempo>
</measure>
```

Listing 188.

#### 4.3.9.2 Rehearsal marks

Rehearsal marks are another specialized kind of directive. Consisting of letters, numbers, or a combination of both, rehearsal marks are used in scores and corresponding performer parts to identify convenient points to restart rehearsal after breaks or interruptions. For this reason, they are often visually emphasized by placing them within a square or circle. In MEI, they are encoded using the `<reh>` element, which holds the textual content of the rehearsal mark. It is a member of the `model.controlEventLike.cmn` class. The visual rendition of the rehearsal mark, including the surrounding shape, may be captured using the `<rend>` element described in chapter [9.2.2 Text Rendition](#).

The following detail from an edition of Hector Berlioz' *Symphonie Fantastique* shows a typical example:

Figure 36. Rehearsal mark

---

```
<measure>
  <staff n="1">
    <!-- content omitted -->
  </staff>
  <staff n="2">
    <!-- content omitted -->
  </staff>
  <staff n="3">
    <!-- content omitted -->
  </staff>
  <reh place="above" staff="1">
    <rend rend="box">37</rend>
  </reh>
</measure>
```

Listing 189.

---

As rehearsal marks usually are placed at the beginning of a measure the tstamp attribute may be omitted. To place it anywhere else the startid, tstamp or even ho attributes could be used.

The following example demonstrates how rehearsal marks often apply to more than one staff. In this instance, the rehearsal mark is placed above staff 1 and below staves 7 and 11.

---

```
<measure>
  <reh place="above" staff="1">A</reh>
  <reh place="below" staff="7 11">A</reh>
</measure>
```

Listing 190.

---

### 4.3.10 Repetition in CMN

Repetition is a characteristic feature of music. Many musical forms rely on repetition (sometimes with modification) of distinct sections of the music. Repetition in this sense can be thought of as 'structural'. At the same time, composers and engravers of music often use local symbols for repeating smaller portions of music instead of writing them in full more than once. In this case, the repetition is better defined as a species of abbreviation.

#### 4.3.10.1 Structural Repetition

Large-scale structural repetition, utilizing [<section>](#) and [<expansion>](#) elements, is discussed in section [2.1.2.2 Content of Musical Divisions](#). This section will focus on repetition within sections.

#### 4.3.10.2 Measure-Level Repetition Symbols

In addition to repetition at the section level, CMN includes a number of different symbols for measure-level repetitions. Many of these symbols are found in manuscripts and may be regarded as personal conventions of their respective authors. Some signs, however, have been widely adopted. For example, it is common to indicate the repetition of a single beat or an entire measure with one or more diagonal lines, sometimes with dots at the upper left and lower right, much like a percent sign. The illustration below contains the most common signs:

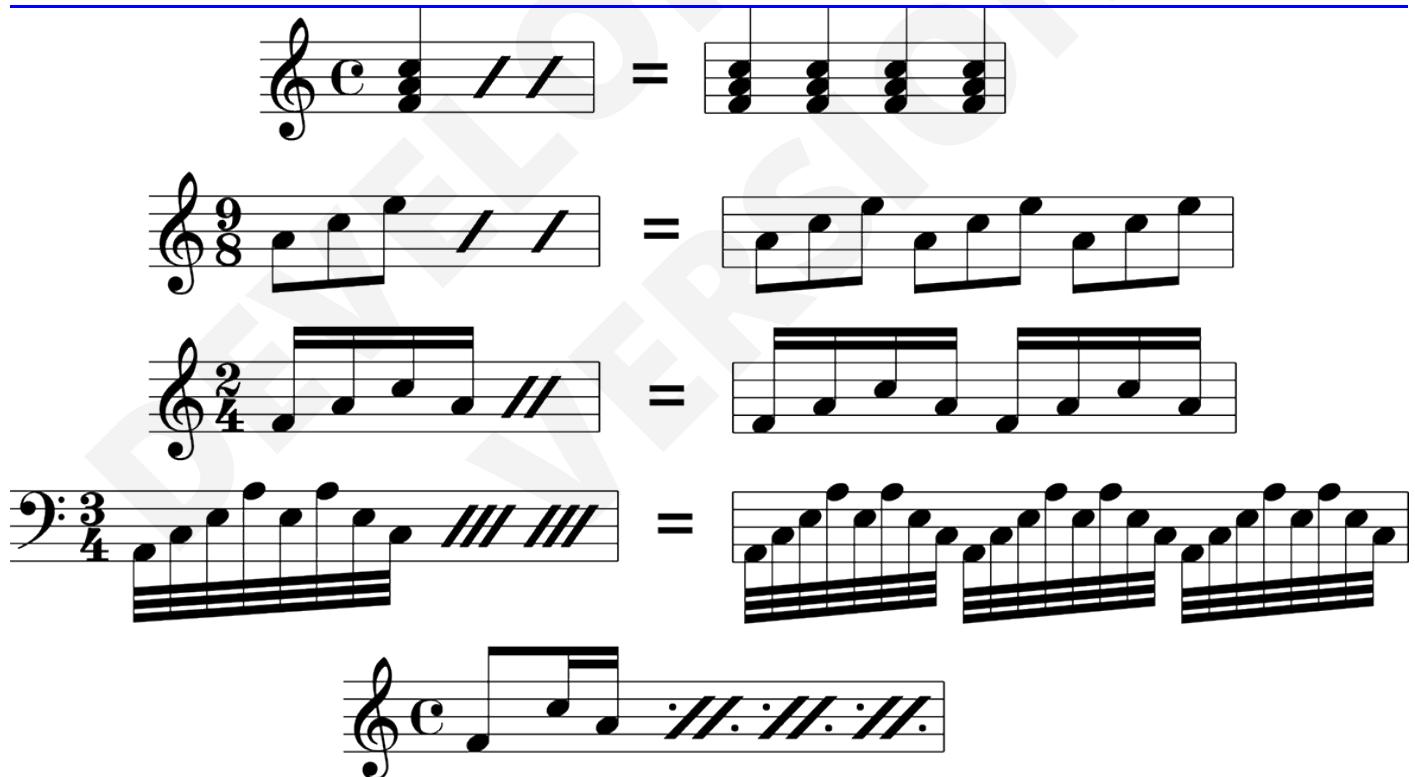

Figure 37. Beat repeat signs

In general, MEI places primary emphasis on the capture of the semantic meaning of symbols, not their visual rendition. In this case, the focus is on the material being repeated, for example, a beat, a measure, a 2-measure fragment, etc. The following elements are provided for this purpose:

**<beatRpt>** An indication that material on a preceding beat should be repeated.

**<halfmRpt>** A half-measure repeat in any meter.

**<mRpt>** An indication that the previous measure should be repeated.

**<mRpt2>** An indication that the previous two measures should be repeated.

**<multiRpt>** Multiple repeated measures.

The **<beatRpt>** element is used to represent a single repeated beat. Its visual rendition can be recorded using the slash attribute. This attribute indicates the number of slashes required to render the appropriate repeat symbol, which, as demonstrated in the preceding figure, depends on the rhythmic content of the beat being repeated. When a beat that consists of a single note or chord is repeated, the repetition sign is typically rendered as a single thick, slanting slash; therefore, the value 1 should be used. The following values should be used when the beat is divided into even notes: 4ths or 8ths=1, 16ths=2, 32nds=3, 64ths=4, 128ths=5. When the beat is comprised of mixed duration values, the symbol is always rendered as 2 slashes and 2 dots.

In addition to its indication of a repeated beat, the **beatRpt** element is sometimes used in popular music notation, especially in guitar or percussion parts, to indicate a repeated rhythmic pattern. The **<beatRpt>** element can be used, but when these parts require durations longer or shorter than a beat, note elements with appropriately-shaped note heads should be employed instead.

The **<mRpt>** element is available for repetition of an entire measure. Like **<mRest>**, it must be the sole child of **<layer>**, no other events should be used. The n attribute of **<mRpt>** should not be used to record the number displayed above the measure in the figure below. Instead, the numbering of repetitions of the written-out measure can be enabled using the multi.number attribute available on the **<scoreDef>** and **<staffDef>** elements.

Figure 38. Measure repetition

---

```
<section>
  <measure>
    <staff>
      <layer>
        <beam>
          <note dur="8" oct="4" pname="f"/>
```

```

<note dur="16" pname="a"/>
<note oct="5" pname="c"/>
<note dur="8" oct="4" pname="a"/>
</beam>

</layer>
</staff>
</measure>
<measure>
<staff>
<layer>
<mRpt/>
</layer>
</staff>
</measure>
<measure>
<staff>
<layer>
<mRpt/>
</layer>
</staff>
</measure>
</section>

```

Listing 191.

The `<halfmRpt>` element represents the incorrect, but frequently found, use of the measure repeat (or similar) sign to indicate repetition of half of a measure. This practice mostly occurs in hand-written notation and usually involves the repetition of the second half of a measure in duple time. This element is necessary because the function of the symbol, not the visual symbol itself, is of primary importance. The following example from the beginning of Beethoven's *Waldstein* sonata illustrates such usage:

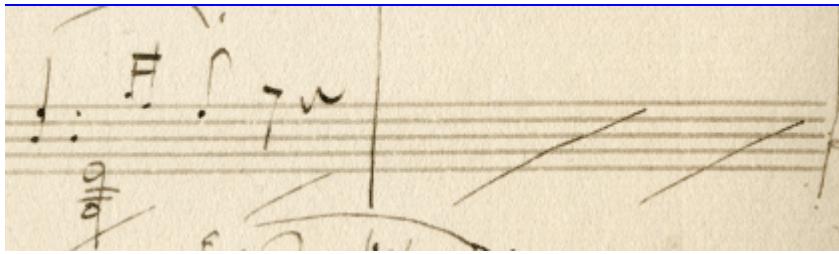

Figure 39. Half-measure repeat

```

<section>
  <measure>
    <staff n="1">
      <!-- omitted -->
    </staff>
    <staff n="2">
      <layer n="1">
        <!-- omitted -->
      </layer>
      <layer n="2">
        <chord dur="2" stem.mod="1slash">
          <note oct="2" pname="g"> </note>
          <note oct="1" pname="b"> </note>
        </chord>
        <halfmRpt/>
      </layer>
    </staff>
  </measure>
  <measure>
    <staff n="1">
      <!-- omitted -->
    </staff>
    <staff n="2">
      <layer n="1">
        <!-- omitted -->
      </layer>
      <layer n="2">
        <halfmRpt/>
        <halfmRpt/>
      </layer>
    </staff>
  </measure>
</section>

```

Listing 192.

As seen in the example above, it is possible to continuously repeat half measures, even across bar lines.

The `<mRpt2>` and `<multiRpt>` elements (like the `<multiRest>` element) never occur in scores, only in performer parts, where it is often necessary to abbreviate the notation due to page size limitations.

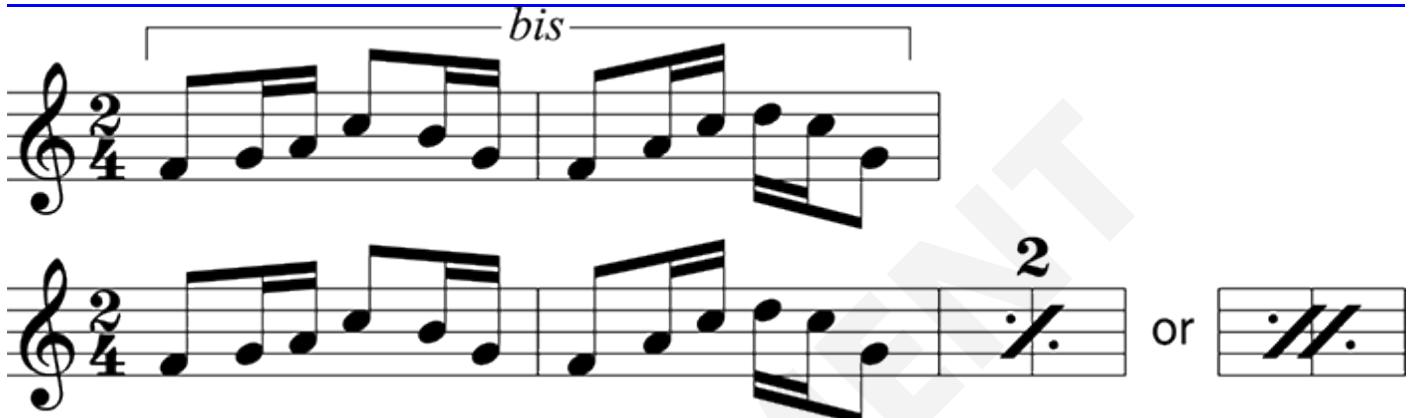

Figure 40. Two-measure repetition

Figure 41. Multi-measure repetition

The `<mRpt2>` element represents repetition of a 2-measure fragment, while `<multiRpt>` is for repetition of fragments longer than two measures. In modern publishing practice, repeats of more than two measures are written out using repeat signs. This element is provided, however, for handling non-standard practices often found in manuscripts. The `num` attribute on `<multiRpt>` records the number of preceding measures to be repeated.

All elements described above allow for association of the sign with a symbol in a digital facsimile (via the `facs` attribute) and with a user-defined symbol (using `altsym`). See [12.1 Facsimiles](#) and [2.4 User-defined Symbols](#) for further details. In addition, the `expand` attribute is available on the foregoing elements to inform a rendering process whether to use the repeat symbol or the full content represented by it. A value of `true` indicates that the content should be displayed, while a `false` value means to show only the repeat symbol.

## 4.4 Common Music Notation Ornaments

This module includes elements and attributes for the encoding of ornaments typical of 'Common Music Notation' (CMN). Ornaments are formulae of embellishment that can be realized by adding supplementary notes to one or more notes of the melody. In written form, these are usually expressed as symbols written above or below a note, though some have a more complex written expression, such as those that involve multiple notes and/or include grace notes.

These symbols may have different resolutions depending on a large number of factors, such as historical context, national boundaries, composer, scribe, etc. The elements described here, therefore, are not bound to a specific symbol; they are, instead, meant to encode the encoder's interpretation of a symbol and its position on the staff.

Nonetheless, in order to establish common ground, the guidelines suggest commonly accepted symbols and realizations for the ornaments supported by MEI.

The following sections will introduce each element in detail for all types of ornaments supported.

### 4.4.1 Encoding Common To All Ornaments

When encoding CMN, ornaments should be encoded within a `<measure>`, following the `<staff>` elements, and connected to events on the staff via attributes. The `startid` attribute is used to refer to the `xml:id` of the starting note. Additionally, if the ornament involves more than one events on the staff, the `endid` attribute can be used to anchor the ornament to a concluding event.

The following example demonstrates the encoding of a mordent over a middle C:

---

```
<measure n="1">
  <staff n="1">
    <layer n="1">
      <note dur="4" oct="4" pname="c" xml:id="co_1_n1"/>
    </layer>
  </staff>
  <mordent place="above" staff="1" startid="#co_1_n1"/>
</measure>
```

Listing 193.

---

Alternatively, the relationship of an ornament to a note can be expressed in terms of beats with the attribute `tstamp`. If the ornament involves more than one event on the staff, the `tstamp2` attribute can be used to indicate the ending time stamp, as is explained in section [4.2.6 Timestamps and Durations](#). These methods may also be utilized simultaneously.

The following example shows the use of `tstamp` for an ornament. Assuming that the following measure is in 2/2, the ornament (in this case, a mordent) is related to the note on the second beat.

```

<measure n="1">
  <staff n="1">
    <layer n="1">
      <note dur="2" oct="4" pname="c"/>
      <note dur="2" oct="4" pname="c"/>
    </layer>
  </staff>
  <mordent place="below" staff="1" tstamp="2"/>
</measure>

```

Listing 194.

The relationship between an ornament and the notes on staff must always be encoded. It is, in fact, a semantic error not to specify a starting event or time stamp for an ornament.

In their resolution, ornaments will involve auxiliary notes, which typically follow the key signature or the scale of the current key. When the ornament involves other chromatic auxiliaries, an accidental is expressed next to or above the ornament sign. The attributes accidlower and accidupper, available on all ornaments described in this chapter, can be used to record this accidental. The attribute values ‘upper’ and ‘lower’ indicate whether the accidental is associated with an upper or lower auxiliary note, not the position of the accidental sign.

#### 4.4.1.1 Overriding Default Resolutions

The symbols and sounded resolutions suggested for each ornament in this chapter are to be considered defaults. Nevertheless, because of the great historical and geographical variance in the notation of ornaments, the encoder is given methods to override the default resolutions.

It is possible, for example, to specify in the `<meiHead>` a new default sounded resolution for an ornament. As discussed in the section [3.4.2 Encoding Description](#), the element `<encodingDesc>` holds a description (optional, but recommended) of the methods and editorial principles which govern the transcription or encoding of the source material. Let us take a trill as an example. The section regarding [4.4.3 Trills](#) does not set a specific number of alternations between the principal and secondary notes; the encoder, however, may specify an exact number in the encoding description.

```

<encodingDesc>
  <editorialDecl>
    <p>All trills should be resolved by playing three alternations.</p>
  </editorialDecl>
</encodingDesc>

```

Listing 195.

Alternatively, resolutions can be defined on a case-by-case basis by encoding a specific resolution using the `<choice>` element. See the section [4.4.3.1 Special Cases](#) below for an example of a specific resolution of a trill.

## 4.4.2 Mordents

A mordent is an ornament that involves an auxiliary note a step above or below the principal note. The presence of a mordent is encoded with the `<mordent>` element and its attributes:

**<mordent>** An ornament indicating rapid alternation of the main note with a secondary note, usually a step below, but sometimes a step above.

form              Records semantic meaning, i.e., intended performance, of the mordent. The `altsym`,  
(`att.mordent.log`) `glyph.name`, or `glyph.num` attributes may be used to specify the appropriate symbol.  
long              When set to 'true', a double or long mordent, sometimes called a "pincé double", consisting of 5  
(`att.mordent.log`) notes, is indicated.

`accidlower` (`att.ornamentAccid`)    Records the written accidental associated with a lower neighboring note.

`accidupper` (`att.ornamentAccid`)    Records the written accidental associated with an upper neighboring note.

It is recommended, but not required, to use the attribute form to encode the typology of mordents. Two common types are supported: those mordents that involve a note lower than the principal note, and those that involve a note higher than the principal note.

The attribute form accepts the following values:

**upper**              usually corresponding to the symbol:  . This mordent is commonly performed as the principal note, followed by its upper neighbor, with a return to the principal note.

**lower**              usually corresponding to the symbol:  . This mordent is commonly performed as the principal note, followed by its lower neighbor, with a return to the principal note.

The following example demonstrates the encoding of simple mordents:

Figure 42. Example of simple mordent

---

```

<measure n="1">
  <staff n="1">
    <layer n="1">
      <note dur="4" oct="5" pname="c" stem.dir="down"/>
      <note dur="4" oct="4" pname="g" stem.dir="up"/>
      <note dur="4" oct="4" pname="b" stem.dir="down"/>
      <note dur="4" oct="5" pname="c" stem.dir="down"/>
    </layer>
  </staff>
  <mordent form="upper" staff="1" tstamp="1"/>
</measure>

```

Listing 196.

Occasionally, mordents can be longer, employing five notes instead of three. The long attribute can be used to identify mordents of this type. The following example shows the encoding of a long mordent:

Figure 43. Example of a long mordent

```

<measure n="1">
  <staff n="1">
    <layer n="1">
      <note dur="4" oct="5" pname="c" stem.dir="down"/>
      <note dur="4" oct="4" pname="g" stem.dir="up"/>
      <note dur="4" oct="4" pname="b" stem.dir="down"/>
      <note dur="4" oct="5" pname="c" stem.dir="down"/>
    </layer>
  </staff>
  <mordent form="upper" long="true" staff="1" tstamp="1"/>
</measure>

```

Listing 197.

#### 4.4.3 Trills

Trills are a type of ornament that consists of a rapid alternation of a note with one a semitone or tone above. A trill is encoded with the **<trill>** element and its attributes:

**<trill>** Rapid alternation of a note with another (usually at the interval of a second above).

accidlower ([att.ornamentAccid](#)) Records the written accidental associated with a lower neighboring note.  
 accidupper ([att.ornamentAccid](#)) Records the written accidental associated with an upper neighboring note.

Trills in modern notation are usually expressed with the abbreviation "tr" above a note on the staff. Often the abbreviation is followed by a wavy line that indicates the length of the trill.

The following example demonstrates the encoding of simple trills:

Figure 44. Example of simple trills.

```
<measure n="1">
  <staff n="1">
    <layer n="1">
      <note dur="4" oct="4" pname="f" stem.dir="up"/>
      <note dur="4" oct="4" pname="a" stem.dir="up"/>
      <rest dur="8"/>
      <note dur="8" oct="5" pname="c" stem.dir="down"/>
      <note dur="4" oct="5" pname="e" stem.dir="down"/>
    </layer>
  </staff>
  <trill place="above" staff="1" tstamp="1"/>
  <trill accidupper="f" place="above" staff="1" tstamp="2"/>
  <trill place="above" staff="1" tstamp="3.5"/>
  <trill accidupper="s" place="above" staff="1" tstamp="4"/>
</measure>
```

Listing 198.

It has been specified earlier that it is a semantic error not to encode a starting event or time stamp for an ornament. This starting point of a trill can be expressed with the startid attribute and/or with the tstamp attribute. Specifying the end point is not required, although the tstamp2 or endid attribute may be used to imply the use of a wavy line extender as shown in this example:

---

Figure 45. Example of trills followed by wavy lines.

---

```

<score>
  <scoreDef>
    <staffGrp>
      <staffDef clef.line="2" clef.shape="G" keysig="2f" lines="5" n="1"/>
    </staffGrp>
  </scoreDef>
  <section>
    <measure n="1">
      <staff n="1">
        <layer n="1">
          <note dur="4" oct="4" pname="f" xml:id="n1"/>
          <note dur="4" oct="5" pname="d" xml:id="n2"/>
          <note dur="4" oct="5" pname="d" xml:id="n3"/>
          <note dur="4" oct="4" pname="g" xml:id="n4"/>
        </layer>
      </staff>
      <trill place="above" staff="1" startid="#n1" endid="#n2"/>
      <trill place="above" staff="1" startid="#n2" endid="#n3"/>
      <trill accidupper="n" place="above" staff="1" startid="#n3" endid="#n4"/>
      <trill accidupper="f" place="above" staff="1" startid="#n4" tstamp2="5"/>
    </measure>
  </section>
</score>

```

---

Listing 199.

---

When giving an end point to trills, the extender attribute should also be added, to indicate the presence or absence of a line extender. Notice, that the note referenced in endid is not part of the trill itself, just like in [glissandos](#).

Chromatic alterations of auxiliary notes are occasionally expressed on the staff using small notes enclosed in parentheses, as shown in the example below. However, the attribute accidupper is still to be used to encode the alteration. Display of the auxiliary note in this ‘cautionary’ manner is left to down-stream rendering processes.

---

Figure 46. Example alterations expressed on the staff.

---

```
<measure n="1">
  <staff n="1">
    <layer n="1">
      <note dur="2" oct="4" pname="g" stem.dir="up"/>
    </layer>
  </staff>
  <trill accidupper="f" place="above" staff="1" tstamp="1"/>
</measure>
```

Listing 200.

Some trills may be introduced by a turn or followed by an inverted turn leading to the next note (see Le garzantine, Musica 2003, p. 911). In such cases, the trill is encoded as in previous examples and associated with the principal note. Starting or concluding turns are notated on the staff (in `<layer>`) as 4.2.5.1.2 Grace Notes.

The following example, from a keyboard sonata by Joseph Haydn, shows a trill with concluding grace notes (called *Nachsenschlag*):

Figure 47. Haydn, Sonata in D major, Hoboken XVI:33 (Wiener Urtex no. 34), mvmt. 1.

```
<measure n="2">
  <staff n="1">
    <layer n="1">
      <note accid.ges="s" dur="32" grace="acc" oct="6" pname="c" stem.dir="up"/>
      <note dur="2" oct="5" pname="b" stem.dir="down"/>
      <graceGrp attach="pre" grace="unacc">
        <beam>
          <note dur="32" oct="5" pname="a" stem.dir="up"/>
          <note dur="32" oct="5" pname="b" stem.dir="up"/>
        </beam>
      </graceGrp>
    </layer>
  </staff>
  <trill place="above" staff="1" tstamp="1" tstamp2="3" vo="6.5"/>
</measure>
```

Listing 201.

### 4.4.3.1 Special Cases

Symbols and abbreviations for trills have changed and evolved considerably throughout history. Strategies to clarify the encoding and interpretation of ornaments have been discussed in section [4.4.1.1 Overriding Default Resolutions](#) above. However, in order to aid the encoder in making educated choices in the encoding of non-standard trills, this section shows two examples diverging from modern standard use.

The abbreviation "tr" followed by a wavy line spanning multiple notes is sometimes used to indicate multiple trills:

Figure 48. Example of multiple trills.

The encoding of this kind of trill may vary depending on the purpose of the encoding. For representation of the source, a single trill is sufficient:

```
<measure n="1">
  <staff n="1">
    <layer n="1">
      <note dur="4" oct="4" pname="f" stem.dir="up"/>
      <note dur="4" oct="4" pname="a" stem.dir="up"/>
      <rest dur="8"/>
      <note dur="8" oct="5" pname="c" stem.dir="down"/>
      <note dur="4" oct="5" pname="e" stem.dir="down"/>
    </layer>
  </staff>
  <trill place="above" staff="1" tstamp="1" tstamp2="0m+4"/>
</measure>
```

Listing 202.

To support analytical and aural rendering applications, however, each trill may be explicitly encoded, as the following example demonstrates:

```
<measure n="1">
  <staff n="1">
    <layer n="1">
      <note dur="4" oct="4" pname="f" stem.dir="up"/>
      <note dur="4" oct="4" pname="a" stem.dir="up"/>
```

```
<rest dur="8" />
<note dur="8" oct="5" pname="c" stem.dir="down" />
  <note dur="4" oct="5" pname="e" stem.dir="down" />
</layer>
</staff>
<trill place="above" staff="1" tstamp="1" />
<trill accidupper="f" place="above" staff="1" tstamp="2" />
<trill place="above" staff="1" tstamp="3.5" />
<trill accidupper="s" place="above" staff="1" tstamp="4" />
</measure>
```

---

Listing 203.

However, when it is necessary to support multiple outputs, use of the `<choice>` element and appropriate sub-elements is recommended. In this case, the `<orig>` and `<reg>` elements can be used to represent the original source and a regularization provided by the editor, respectively:

---

```
<choice>
  <orig>
    <trill place="above" staff="1" tstamp="1" tstamp2="0m+4" />
  </orig>
  <reg>
    <trill place="above" staff="1" tstamp="1" />
    <trill accidupper="f" place="above" staff="1" tstamp="2" />
    <trill place="above" staff="1" tstamp="3.5" />
    <trill accidupper="s" place="above" staff="1" tstamp="4" />
  </reg>
</choice>
```

---

Listing 204.

Another situation that requires disambiguation of an ornament's name and its potential rendition is due to the fact that the symbols for trills and mordents have been often used interchangeably in the past. The following example, taken from *Klavierbüchlein für Wilhelm Friedemann Bach* (1720), shows a trill (*Trillo*) identified by the symbol associated with a mordent in modern practice. Nonetheless, J.S. Bach's suggested resolution should be encoded with a variant of the procedure presented above.

In the example below, the child elements of `<choice>`; that is, `<orig>` and `<reg>`, represent non-exclusive options; that is, both may be processed by applications that aim to support both visual and aural renditions.

Figure 49. Trill transcribed from J. S. Bach's Klavierbüchlein für Wilhelm Friedemann Bach

```

<measure n="1">
  <staff n="1">
    <layer n="1">
      <note dur="4" oct="5" pname="c" stem.dir="down"/>
    </layer>
  </staff>
  <choice>
    <orig>
      <trill place="above" staff="1" tstamp="1"/>
    </orig>
    <reg>
      <note dur="32" oct="5" pname="d"/>
      <note dur="32" oct="5" pname="c"/>
      <note dur="32" oct="5" pname="d"/>
      <note dur="32" oct="5" pname="c"/>
      <note dur="32" oct="5" pname="d"/>
      <note dots="1" dur="16" oct="5" pname="c"/>
    </reg>
  </choice>
</measure>

```

Listing 205.

Depending on the purpose of the encoding, it may be more convenient to encode the regularized text within the stream of events, along with a corresponding choice with regard to the existence of the trill marking, as in the following example:

```

<measure>
  <staff>
    <layer>
      <choice>
        <orig>
          <note dur="4" oct="5" pname="c" stem.dir="down"/>
        </orig>
        <reg>

```

```
<note dur="32" oct="5" pname="d"/>
<note dur="32" oct="5" pname="c"/>
<note dur="32" oct="5" pname="d"/>
<note dur="32" oct="5" pname="c"/>
<note dur="32" oct="5" pname="d"/>
<note dots="1" dur="16" oct="5" pname="c"/>
  </reg>
</choice>
</layer>
</staff>
<choice>
  <orig>
    <trill place="above" staff="1" tstamp="1"/>
  </orig>
  <reg> </reg>
</choice>
</measure>
```

---

Listing 206.

The `<orig>` element contains the single-note-with-trill transcription of the original text, while the `<reg>` element represents the realization-without-trill version.

This approach facilitates substitution of the realization of the trill for the original written note (as well as the opposite procedure) and is therefore the recommended markup for applications where exchange of this kind is desirable.

#### 4.4.4 Turns

A turn is an ornament that typically consists of four notes: the upper neighbor of the principal note, the principal note, the lower neighbor, and the principal note again.

The presence of a turn is encoded with the `<turn>` element and its attributes:

form	Records meaning; i.e., intended performance, of the turn. The <code>altsym</code> , <code>glyph.name</code> , or <code>glyph.num</code> attributes may be used to specify the appropriate symbol.
( <code>att.turn.log</code> )	
delayed	When set to 'true', the turn begins on the second half of the beat.
( <code>att.turn.log</code> )	

`accidlower` (`att.ornamentAccid`) Records the written accidental associated with a lower neighboring note.  
`accidupper` (`att.ornamentAccid`) Records the written accidental associated with an upper neighboring note.

It is recommended, but not required, to use the attribute `form` to encode the typology of the turn.

The attribute `form` accepts the following values:

**upper** usually corresponding to the symbol: This turn is commonly performed beginning on a note higher than the principal note.

**lower** usually corresponding to the symbol: This turn is commonly performed beginning on a note lower than the principal note.

The following example shows the encoding of a simple turn:

Figure 50. Example of a simple turn.

```
<measure n="1">
  <staff n="1">
    <layer n="1">
      <note dur="4" oct="5" pname="c" stem.dir="down"/>
      <note dur="4" oct="5" pname="d" stem.dir="down"/>
      <note dur="4" oct="5" pname="e" stem.dir="down"/>
      <note dur="4" oct="5" pname="c" stem.dir="down"/>
    </layer>
  </staff>
  <turn form="upper" staff="1" tstamp="1"/>
</measure>
```

Listing 207.

Turns can sometimes be performed after the principal note (usually on the second half of the beat, see Read 1979, p. 246) and leading to the following event. To indicate this, the turn symbol is typically written in between the principal note and the next. These kind of turns are encoded with the attribute delayed.

The following example from Beethoven's piano sonata no. 1 in F minor, op. 2, no. 1, mvmt. 2 demonstrates the encoding of turns with the delayed attribute. Note that the tstamp attribute indicates the actual starting point in time, while startid points to the principal note.

Figure 51. Delayed turn.

```

<measure>
  <staff n="1">
    <layer n="1">
      <note dots="1" dur="4" oct="5" pname="g" stem.dir="down" tie="i"/>
      <beam>
        <note dots="1" dur="16" oct="5" pname="g" stem.dir="down" tie="t"/>
        <note dur="32" oct="5" pname="a" stem.dir="down"/>
      </beam>
    </layer>
  </staff>
  <turn accidlower="s" delayed="true" place="above" staff="1" tstamp="2.75"/>
</measure>

```

Listing 208.

#### 4.4.5 Other Ornaments

CMN ornaments that are not mordents, trills, or turns can be encoded with a generic [`<ornam>`](#).

This element allows the encoder to represent ornaments as textual strings (e.g., with a Unicode symbol) or with a user defined symbol. Chromatic auxiliaries can be represented with accidlower and accidupper. The [`<ornam>`](#) element can also be a control element. That is, it can be linked via its attributes to other events. The starting point of the directive may be indicated by either a tstamp, tstamp.ges, tstamp.real or startid attribute, while the ending point may be recorded by either a tstamp2, dur, dur.ges or endid attribute. It is a semantic error not to specify a starting point attribute.

For example, Johann Sebastian Bach used non-standard ornaments in the *Klavierbüchlein für Wilhelm Friedemann Bach*:

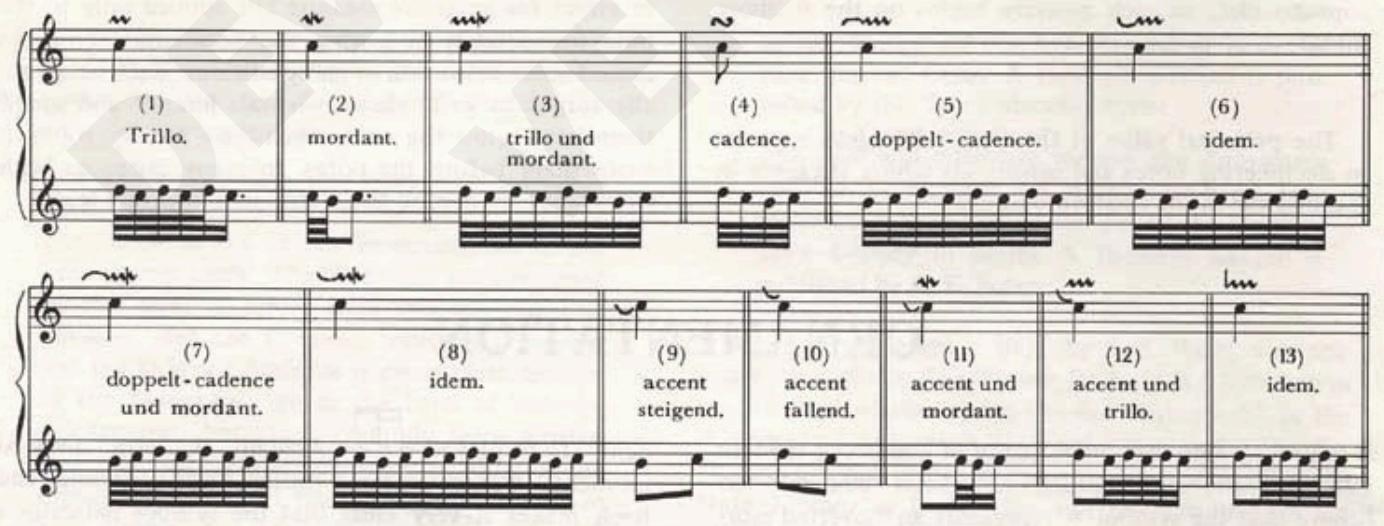

Figure 52. Table of ornaments used by Johann Sebastian Bach in the *Klavierbüchlein für Wilhelm Friedemann Bach*

The ornament for (5) doppelt-cadence could be encoded in the following way, by adopting the Unicode code-points defined by the SMuFL standard:

```
<ornam tstamp="1">
  <symbol glyph.auth="smufl" glyph.num="#xE5C0"
    glyph.name="ornamentPrecompDoubleCadenceLowerPrefix"/>
</ornam>
```

Listing 209.

A resolution, or expansion of the ornament can be provided as discussed in [4.4.3.1 Special Cases](#) below.

#### 4.4.6 Ornaments in Combinations

Particularly in baroque keyboard music, but also in the early classical period, various combinations of ornaments can be found. Despite being written vertically above the same note, they are to be performed in sequence.

The following example from [Carl Philipp Emanuel Bach's](#) song *Dorinde* Wq 199/7 shows a turn followed by a inverted mordent:

The musical score consists of two staves. The top staff is in common time (indicated by '3/4') and has a bass clef. It features a series of notes with combined ornaments: a turn (a short vertical line with a small circle at the top) followed by an inverted mordent (two small circles, one above the other). This pattern repeats three times. The lyrics 'A - mor' and 'sag - te' are written below the notes. The bottom staff is also in common time (indicated by '3/4') and has a bass clef. It shows a single note followed by a sixteenth-note pattern, which is likely a realization of the combined ornaments from the top staff.

Figure 53. Combined ornaments in C.P.E. Bach's song *Dorinde*

When encoding the example above, both ornaments will be positioned above the same note. The encoded order of the elements, moreover, may correspond to the performed sequence, which in this example is top to bottom: first the turn, then the mordent. As every renderer deals differently with such combined ornaments it is best practice to encode the performed sequence additionally with next and prev attributes. The visual order can be specified globally with aboveorder in the preceding [`<scoreDef>`](#).

```
<measure n="3">
  <staff n="1">
    <layer n="1">
```

```
<note dur="8" grace="unknown" oct="5" pname="f" stem.dir="up"/>
<note dur="4" oct="5" pname="e" stem.dir="down" xml:id="ex_m3_n1"/>
<beam>
  <note dur="16" oct="5" pname="d" stem.dir="up"/>
  <note accid="s" dur="16" oct="4" pname="f" stem.dir="up"/>
  <note dur="16" oct="4" pname="g" stem.dir="up"/>
  <note dur="16" oct="5" pname="e" stem.dir="up"/>
</beam>
<note dur="8" grace="unknown" oct="5" pname="d" stem.dir="up"/>
  <note dur="4" oct="5" pname="c" stem.dir="down" xml:id="ex_m3_n2"/>
</layer>
</staff>
<mordent xml:id="or_1" form="upper" staff="1" startid="#co_1_m_n1" prev="#or_2"/>
<turn xml:id="or_2" form="upper" staff="1" startid="#co_m_1_n1" next="#or_1"/>
<mordent xml:id="or_3" form="upper" staff="1" startid="#co_m_1_n2" prev="#or_4"/>
<turn xml:id="or_4" form="upper" staff="1" startid="#co_m_1_n2" next="#or_3"/>
</measure>
```

Listing 210.

## 5 Repertoire: Mensural Notation

This chapter describes the module for encoding mensural notation from the late 13th century to about 1600. Historically, mensural notation preceded the development of Common Music Notation (CMN) and it included a wide range of features that persist in CMN and that can be encoded in a standard manner in MEI. In mensural notation, pitches are notated as in CMN, leaving out here the major exception of *musica ficta*. The pitch is given by the position of the note on the staff and the current clef as in CMN, and the mensural module introduces no modification to MEI regarding how pitches are encoded.

There are a number of differences, however, in the representation of duration in mensural notation. The mensural module introduces specific attribute values for notes and rests for appropriately encoding mensural durations. One of the main differences is that the duration of a note is not determined by its symbol, but also by the meter and the context in which the symbol appears in relation to other notes and rests in the same voice. The meter is given by one of the 16 mensural *species* provided by four levels of division: *modus major*, *modus minor*, *tempus* and *prolatio*. In the case of triple meter and depending on the specific context where the note is positioned, certain rules must be applied in order to determine the duration of a note. In these cases, encoding both the sign and its actual duration is highly recommended (as will be shown in [5.1 Durations](#)).

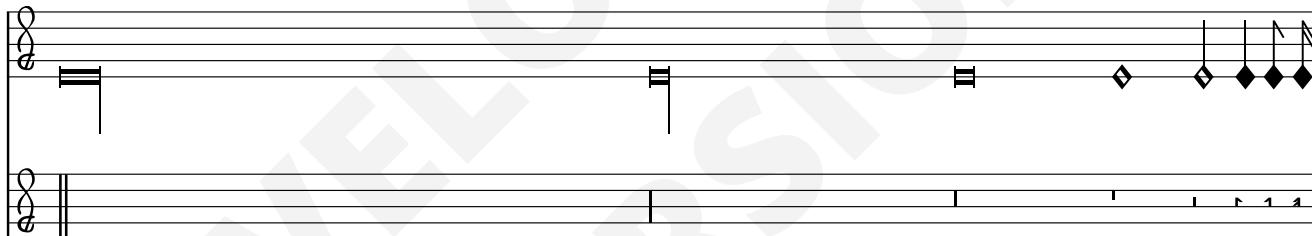

Another difference is the use of proportions that are indicated by numeric ratios or by specific mensuration signs. The proportions indicate that the durations have to be modified and they may be combined. Proportions and mensuration signs were eventually simplified and became time signatures in CMN. The attributes and elements available in this module for encoding mensural signs and proportions can be found below (see [5.2 Mensuration](#) and [5.3 Proportions](#)).

In mensural notation, notes can also be notated in ligatures that regroup two or more notes. Ligatures were a legacy from an earlier notation system that were still widely used in Renaissance music notation. They gradually disappeared during the seventeenth century. The mensural module provides multiple ways of encoding the ligatures.

## 5.1 Durations

When the mensural module is included, dur on `<note>`, `<rest>`, and other elements takes the following values (from the Latin names of notes):

- maxima** Two or three times as long as a longa
- longa** Two or three times as long as a brevis
- brevis** Two or three times as long as a semibrevis
- semibrevis** Half or one-third as long as a brevis
- minima** Half or one-third as long as a semibrevis
- semiminima** Half as long as a minima
- fusa** Half as long as a semiminima
- semifusa** Half as long as a fusa

```

<staff n="1">
  <layer n="1">
    <note dur="maxima"/>
    <note dur="longa"/>
    <note dur="brevis"/>
    <note dur="semibrevis"/>
    <note dur="minima"/>
    <note dur="semiminima"/>
    <note dur="fusa"/>
    <note dur="semifusa"/>
  </layer>
</staff>
<staff n="2">
  <layer n="1">

```

```

<rest dur="maxima"/>
<rest dur="longa"/>
<rest dur="brevis"/>
<rest dur="semibrevis"/>
<rest dur="minima"/>
<rest dur="semiminima"/>
<rest dur="fusa"/>
<rest dur="semifusa"/>
</layer>
</staff>

```

Listing 211.

Normally, *longa* rests are vertical strokes occupying two or three spaces in the staff, depending on the mensuration. For instance, in *modusminor*=3, they take up three spaces; and in *modusminor*=2, they take two. However, there are situations where both types of *longa* rests can be present in the same piece, regardless of the *modus minor*. For this reason, the *dur* attribute can take on two other values when used within `<rest>` elements:

**2B** Two-breve rest

**3B** Three-breve rest

The example below illustrates this case in a passage in *perfect modus* from the *triplum* voice of a motet in the *Roman de Fauvel* music manuscript. The blue arrows on the image are pointing to the two-breve and three-breve rests in this passage.

```

Listing 212.

### 5.1.1 Alteration and Imperfection

In ternary mensurations, the ambiguity between the note shape and its actual duration requires specific attention. The rules of mensural notation can require the alteration or the imperfection of a note; that is, an increase or reduction in its performed duration. In these cases, if the encoding is intended to be used for more than just graphically representing the notation, encoding only the note shape by means of the dur attribute alone is insufficient. In that case, in addition to encoding the duration sign in the dur attribute, it is recommended to encode its performed duration in the dur.quality attribute. The dur.quality attribute specifies the length of a note according to the contextual rules of mensural notation. Its values, listed below, are adopted from the original Latin terms:

**perfecta** Three times the duration of the note in the next smaller degree

**imperfecta** Two times the duration of the note in the next smaller degree

**altera** Twice the original duration of the note (only usable in perfect mensurations)

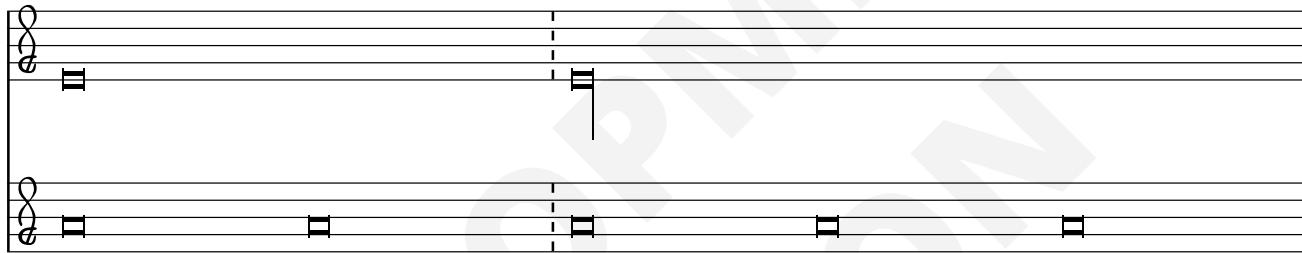

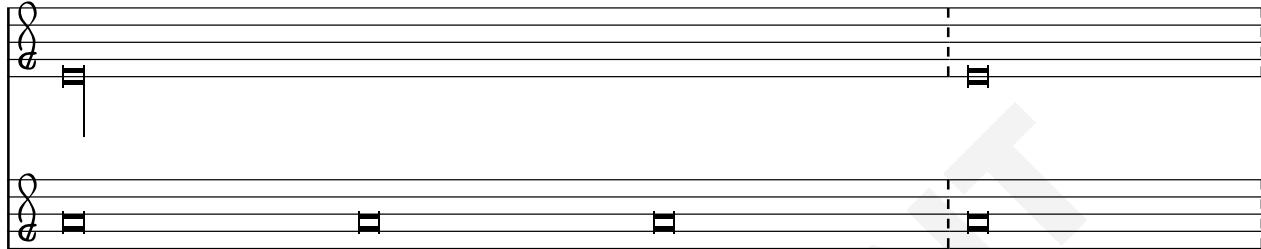

**minor** Category of a regular semibrevis in Ars antiqua, equivalent to a third of a brevis

**maior** Category of an altered semibrevis in Ars antiqua, equivalent to two minor semibrevis

**duplex** One of the three categories of a longa in Ars antiqua ('duplex', 'perfecta', and 'imperfecta')

The last three values are to be used exclusively in *Ars antiqua* mensural notation, where maior and minor refer to types of *semibreves*, and duplex refers to a type of *longa*. Examples of each of these six values are presented below. In these examples, the 'voice' staff renders the notes in the code snippet, and the 'reference' staff, together with the dotted bar lines, are shown to help to visualize the relative values of the notes in the 'voice' staff.

The following example illustrates an *alteration* (the second *brevis*) in *modus minor perfectus*. Notice that the second *brevis* has doubled its regular value, it has been altered, unlike the first one.

```
<!-- mensuration encoded in <staffDef> element indicates @modusminor = 3 -->
<layer n="1">
  <note dur="longa" dur.quality="perfecta"/>
  <barLine form="dashed"/>
  <note dur="brevis"/>
  <barLine form="dashed"/>
  <note dur="brevis" dur.quality="altera"/>
  <barLine form="dashed"/>
  <note dur="longa" dur.quality="perfecta"/>
  <barLine form="dashed"/>
</layer>
```

Listing 213.

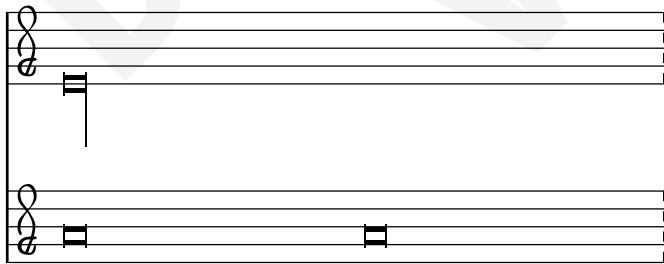

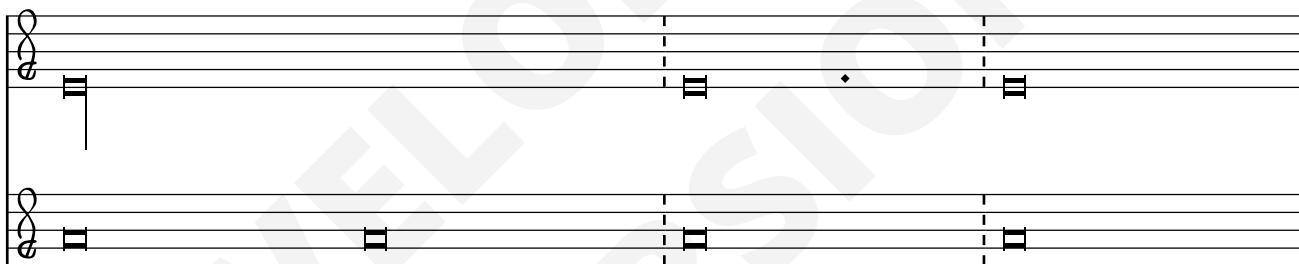

It is possible to omit the `dur.quality` attribute in a note when the performed duration of the note is the default value provided by the mensuration. In this case, the *longas* are perfect, just as the mensuration (*perfect modus minor*) indicates. Therefore, the `dur.quality` attribute can be omitted for the two *longas*.

```
<!-- mensuration encoded in <staffDef> element indicates @modusminor = 3 -->
<layer>
  <note dur="longa"/>
  <note dur="brevis"/>
  <note dur="brevis" dur.quality="altera"/>
  <note dur="longa"/>
</layer>
```

Listing 214.

The same applies to the examples that follow.

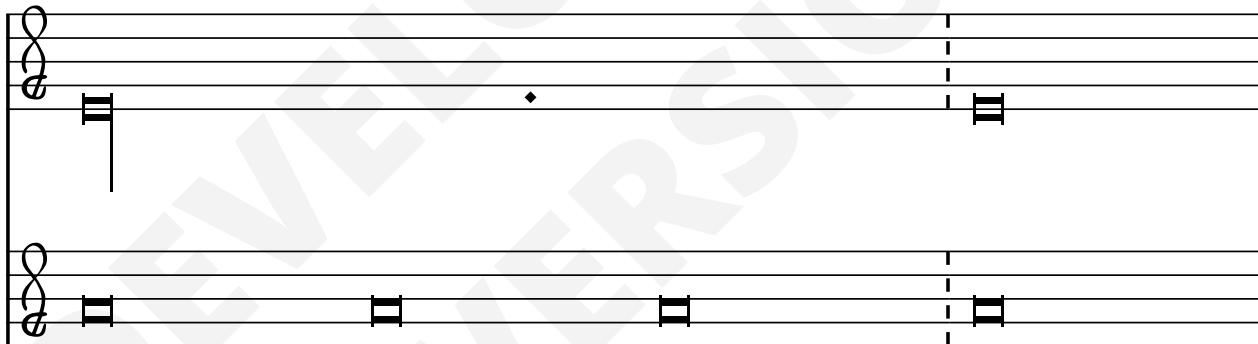

The following example illustrates an *imperfection* (the two *longae*) in *modus minor perfectus* with the same *longa-brevis-brevis-longa* sequence but with an additional *dot of division* between the two *breves* (see 5.6.4 Dots for more details). Notice that here the *longae* have been imperfected, unlike the previous example in which they kept the perfect value indicated by the mensuration.

```
<!-- mensuration encoded in <staffDef> element indicates @modusminor = 3 -->
<layer n="1">
<note dur="longa" dur.quality="imperfecta"/>
<barLine form="dashed"/>
<note dur="brevis"/>
<dot form="div"/>
<barLine form="dashed"/>
<note dur="brevis"/>
<barLine form="dashed"/>
<note dur="longa" dur.quality="imperfecta"/>
<barLine form="dashed"/>
</layer>
```

Listing 215.

The following example in *modus minor imperfectus* illustrates the use of a dot of augmentation following the *longa* (see 5.6.4 Dots for more details). Notice that the *longa*, which is supposed to be imperfect according to the mensuration, has a perfect value due to the augmentation dot.

```
<!-- mensuration encoded in <staffDef> element indicates @modusminor = 2 and @tempus = 2 -->
<layer n="1">
<note dur="longa" dur.quality="perfecta"/>
<dot form="aug"/>
<barLine form="dashed"/>
<note dur="brevis"/>
<barLine form="dashed"/>
</layer>
```

---

**Listing 216.**

---

Finally, the following example illustrates the dur.quality values related to the *Ars antiqua* style, for *perfect modus*, with the breve equivalents notated in the lower staff for reference (as in the previous examples).

---

The image displays four staves of musical notation. Each staff begins with a clef (G-clef) and a 'C' (common time). The first staff contains a breve (a thick black square) followed by six eighth notes (smaller black diamonds). The second staff contains a breve followed by five eighth notes. The third staff contains a breve followed by four eighth notes. The fourth staff contains a breve followed by five eighth notes. A large, faint watermark reading 'SAMPLE' diagonally across the page.

<!-- mensuration encoded in <staffDef> element indicates @modusminor = 3 and @tempus = 3 -->

---

```
<layer n="1">
  <note dur="longa" dur.quality="perfecta"/>
  <barLine form="dashed"/>
  <note dur="semibrevis" dur.quality="minor"/>
  <note dur="semibrevis" dur.quality="minor"/>
  <note dur="semibrevis" dur.quality="minor"/>
  <dot form="div"/>
  <barLine form="dashed"/>
  <note dur="semibrevis" dur.quality="minor"/>
  <note dur="semibrevis" dur.quality="maior"/>
  <barLine form="dashed"/>
  <note dur="brevis"/>
  <barLine form="dashed"/>
  <note dur="longa" dur.quality="duplex"/>
  <barLine form="dashed"/>
</layer>
```

Listing 217.

Note: In *Ars Antiqua*, only the *longa* could be "perfecta" / "imperfecta" and the *brevis* could have a regular value ("recta") or be "altera". In the *Ars nova*, principles of imperfection and alteration were extended into the other note levels (*brevis-semibrevis* and *semibrevis-minima*). This means that the *breves* in *Ars antiqua* do not have a "perfecta" / "imperfecta" quality, and this is why there is no *dur.quality* attribute for the *breves* in the previous example. However, the *brevis* can have a ternary division (indicated by *tempus*="3"), being divided either into three (equal) *minor semibreves* or into a *minor-maior* pair of *semibreves*. The encoding also allows for the possibility of encoding a binary division of the breve in *Ars antiqua* notations: the indication *tempus*="2" indicates the breve is divided into two equal *semibreves*. This is why in this example with *tempus*="3", the *semibreves* do have a *dur.quality* attribute (with values *minor* or *maior*).

An alternative encoding---removing the *dur.quality* attributes for notes which lengths are not modified from their default values (i.e., the perfect long and the minor *semibreves*)---would be:

```
<!-- mensuration encoded in <staffDef> element indicates @modusminor = 3 and @tempus = 3 -->
<layer>
  <note dur="longa"/>
  <note dur="semibrevis"/>
  <note dur="semibrevis"/>
  <note dur="semibrevis"/>
  <dot form="div"/>
  <note dur="semibrevis"/>
  <note dur="semibrevis" dur.quality="maior"/>
  <note dur="brevis"/>
  <note dur="longa" dur.quality="duplex"/>
</layer>
```

Listing 218.

The conjunct use of the dur and dur.quality attributes is generally enough to encode the duration of a note—and, as indicated before, one could even remove dur.quality when its value is in agreement with the mensuration. However, there are cases (e.g., partial imperfection) where the values of dur.quality are not enough to provide the note's duration.

### 5.1.2 Partial Imperfection

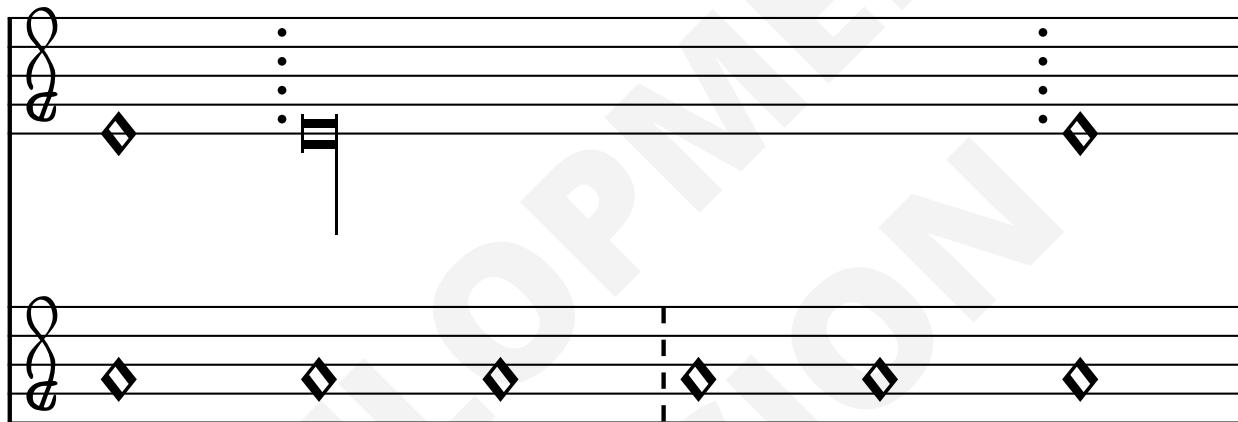

In opposition to regular imperfection, which is caused by a note of the next smaller degree (e.g., a perfect *brevis* imperfected by a following/preceding *semibrevis*), partial imperfection is caused by a note of two or even three orders apart. As an example, consider an imperfect *longa* made up of two perfect *breves*. This *longa* can be ‘partially imperfect’ by a following/preceding *semibrevis*. This *semibrevis* causes part of the *longa*—one of its perfect *breves*—to be imperfected, taking away one-third of one of its two halves. In this case, the *longa*'s value changes from 6 *semibreves* (two perfect *breves*) into 5 *semibreves*. Partial imperfection is not supported by the dur.quality attribute—because there can be many cases of partial imperfection, as will be seen in the following examples. To encode a partial imperfection, the num and numbase pair of attributes are used instead. Given the change in the *longa*'s value from 6 *semibreves* to 5 *semibreves*, the corresponding attributes to encode this particular case of partial imperfection would be num="6" and numbase="5" as shown below in the code snippet and its rendering.

```
<!-- mensuration encoded in <staffDef> element indicates @modusminor = 2 and @tempus = 3 -->
<layer n="1">
  <note dur="longa" num="6" numbase="5"/>
  <barLine form="dotted"/>
  <note dur="semibrevis"/>
```

```
<barLine form="dashed" />
</layer>
```

Listing 219.

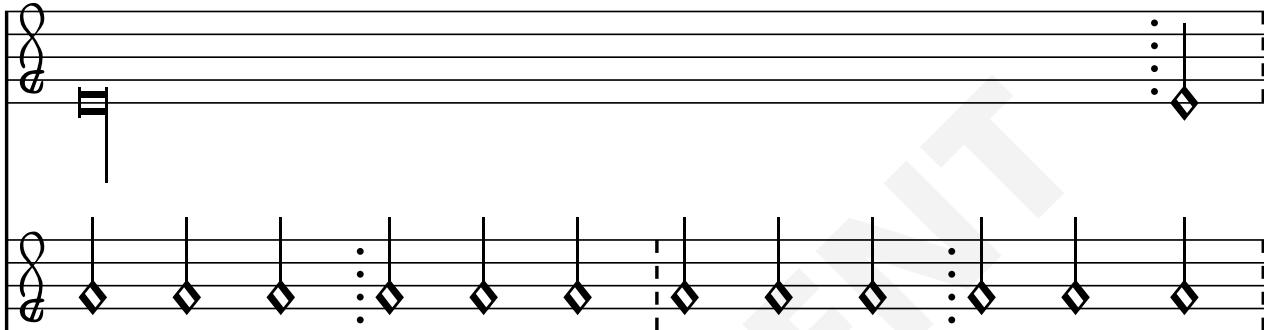

Partial imperfection can also happen from both sides of a note at once, as shown below:

```
<!-- mensuration encoded in <staffDef> element indicates @modusminor = 2 and @tempus = 3 -->
<layer n="1">
  <note dur="semibrevis" />
  <barLine form="dotted" />
  <note dur="longa" num="6" numbase="4" />
  <barLine form="dotted" />
  <note dur="semibrevis" />
  <barLine form="dashed" />
</layer>
```

Listing 220.

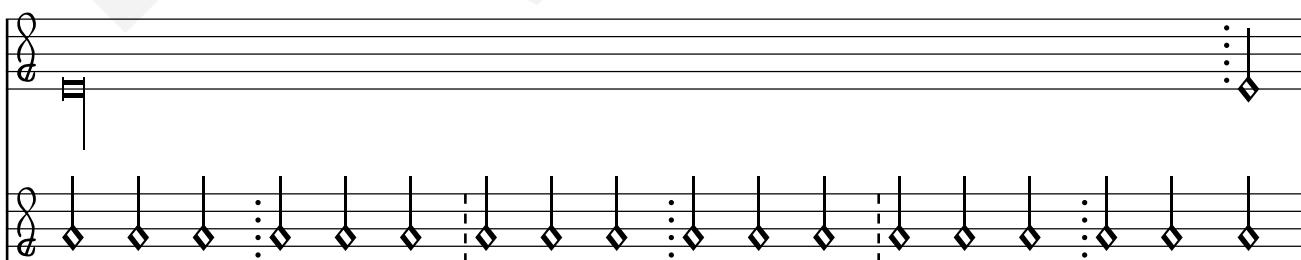

An example of partial imperfection caused by a note three orders apart is given next. Here the *longa* is partially imperfected by a *minima* (instead of by a *semibrevis*).

```
<!-- mensuration encoded in <staffDef> element indicates @modusminor = 2, @tempus = 2, and
@prolatio = 3 -->
<layer n="1">
  <note dur="longa" num="12" numbase="11"/>
  <barLine form="dotted"/>
  <note dur="minima"/>
  <barLine form="dashed"/>
</layer>
```

Listing 221.

In the next example, the *longa* is also imperfected by a *minima*. However, the num and numbase ratio is different from the example above because the default value of the *longa* here (18 *minimas*) is different from that of the previous example (12 *minimas*).

```
<!-- mensuration encoded in <staffDef> element indicates @modusminor = 3, @tempus = 2, and  
@prolatio = 3 -->  
<layer n="1">  
  <note dur="longa" num="18" numbase="17"/>  
  <barLine form="dotted"/>  
  <note dur="minima"/>  
  <barLine form="dashed"/>  
</layer>
```

Listing 222.

---

## 5.2 Mensuration

Using the mensural module, mensuration signs can be indicated with the attributes available on the `<scoreDef>` and `<staffDef>` elements. Mensuration signs encoded using attributes on `<scoreDef>` are regarded as default values which may be overridden by values attached to individual `<staffDef>` elements.

The division levels corresponding to *modus maior*, *modus minor*, *tempus*, and *prolatio* can be encoded in the `modusmaior`, `modusminor`, `tempus`, and `prolatio` attributes respectively. Their value must be 3 (perfect) or 2 (imperfect).

<code>modusmaior</code> ( <code>att.mensural.shared</code> )	Describes the maxima-long relationship.
<code>modusminor</code> ( <code>att.mensural.shared</code> )	Describes the long-breve relationship.
<code>tempus</code> ( <code>att.mensural.shared</code> )	Describes the breve-semibreve relationship.
<code>prolatio</code> ( <code>att.mensural.shared</code> )	Describes the semibreve-minim relationship.

The mensur signs themselves can be encoded in the `mensur.sign` attribute with a possible value of C or O. Its orientation can be encoded in the `mensur.orient` attribute, for example, with the value reversed for a flipped C sign. The number of slashes (up to 6) can be given in the `mensur.slash` attribute. There is also a `mensur.dot` attribute for indicating the presence of a dot through the boolean values true or "false".

<code>mensur.sign</code> ( <code>att.mensural.vis</code> )	The base symbol in the mensuration sign/time signature of mensural notation.
<code>mensur.dot</code> ( <code>att.mensural.vis</code> )	Determines if a dot is to be added to the base symbol.
<code>mensur.slash</code> ( <code>att.mensural.vis</code> )	Indicates the number lines added to the mensuration sign. For example, one slash is added for what we now call 'alla breve'.
<code>mensur.orient</code> ( <code>att.mensural.vis</code> )	Describes the rotation or reflection of the base symbol.

`<mensur>` elements can also be used instead of `<staffDef>` and its attributes. In `<mensur>`, the division levels are encoded with the previously mentioned `modusmaior`, `modusminor`, `tempus`, and `prolatio` attributes, while the attributes to indicate the mensur signs are: `sign`, `orient`, `slash`, and `dot`. `<mensur>` can be a child of the `<staffDef>` and `<layer>` elements.

**<mensur>** Collects information about the metrical relationship between a note value and the next smaller value; that is, either triple or duple.

<code>modusmaior</code> ( <code>att.mensural.shared</code> )	Describes the maxima-long relationship.
<code>modusminor</code> ( <code>att.mensural.shared</code> )	Describes the long-breve relationship.
<code>tempus</code> ( <code>att.mensural.shared</code> )	Describes the breve-semibreve relationship.
<code>prolatio</code> ( <code>att.mensural.shared</code> )	Describes the semibreve-minim relationship.

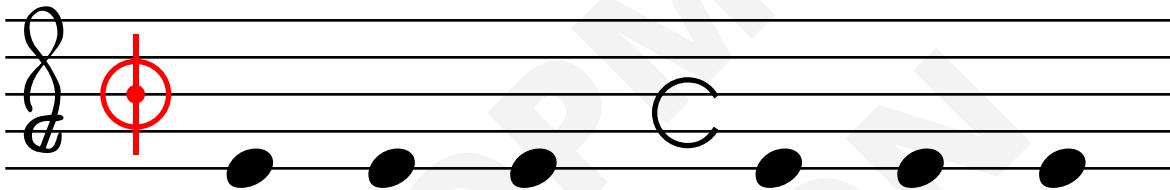

`sign` (`att.mensur.vis`) The base symbol in the mensuration sign/time signature of mensural notation.

dot ([att.mensur.vis](#)) Specifies whether a dot is to be added to the base symbol.  
 orient ([att.mensur.vis](#)) Describes the rotation or reflection of the base symbol.

slash ([att.slashCount](#)) Indicates the number of slashes present.

### 5.2.1 Change in mensuration

The following example illustrates a *change in mensuration*. In this case, the element `<mensur>` is used within the `<layer>` element, preceding the stream of notes affected by the new mensuration defined by it.

```

<score>
  <scoreDef>

Listing 223.

### 5.2.2 Implicit mensuration

It is common in *Ars antiqua* and some *Ars nova* pieces to have no mensuration signs. In this case, the mensuration—the division levels corresponding to *modus maior*, *modus minor*, *tempus*, and *prolatio*—is given by the context. The next example shows the incipit of a four-voice piece, Josquin's *Tu solus qui facis mirabilia*, where only two of the voices (*Cantus* and *Tenor*) have a mensuration sign. The other two (*Altus* and *Bassus*) have *no mensuration signs*, and the *mensura* is given by the context. Therefore, while only the *Cantus* and the *Tenor* have attributes for encoding the mensuration sign (in this case, *mensur.sign* and *mensur.slash*), all four voices include attributes to encode the *mensura* (*tempus* and *prolatio*).

Listing 224.

### 5.2.3 Italian Divisiones

The division of the breve in Italian trecento notation can be encoded using the `divisio` attribute, which provides the values: `ternaria`, `quaternaria`, `senariaimperf`, `senariaperf`, `octonaria`, `novenaria`, `duodenaria`. The `divisio` attribute would usually replace the use of the `tempus` and `prolatio` set of attributes.

`divisio` (`att.mensural.shared`) Describes the divisions of the breve in use in 14th-century Italy.

The signs for the Italian *divisiones* can be encoded in the `sign` or `mensur.sign` attribute (to be used with `mensur` or `staffDef` respectively), with the values: `t` for `ternaria`, `q` for `quaternaria`, `si` and `i` for `senaria imperfecta`, `sp` and `p` for `senaria perfecta`, `oc` for `octonaria`, `n` for `novenaria`, and `d` for `duodenaria`. And the additional values for `senaria gallica`, `sg` and `g`, and `senaria ytalica`, `sy` and `y`.

## 5.3 Proportions

Proportions can also be indicated within the `<staffDef>` element. The `proport.num` and `proport.numbase` attributes are available for encoding the numerator and the denominator of the proportion, respectively. There is also a `<proport>` element that can be used as an alternative, with the corresponding `num` and `numbase` attributes.

**<proport>** Description of note duration as arithmetic ratio.

## 5.4 Ligatures

Ligatures can be encoded using the `<ligature>` element. The `form` attribute is available for specifying if the ligature is *recta* or *obliqua*.

Figure 55. Recta and obliqua ligatures

```
<layer>
  <ligature form="recta">
    <note dur="semibrevis" oct="4" pname="d"/>
    <note dur="semibrevis" oct="3" pname="g"/>
  </ligature>
  <ligature form="obliqua">
    <note dur="semibrevis" oct="3" pname="g"/>
    <note dur="semibrevis" oct="4" pname="c"/>
  </ligature>
</layer>
```

Listing 225.

In cases where the ligature contains both *recta* and *obliqua* notes, the `lig` attribute of the `<note>` element can be used to specify the form of the ligature at the note level.

Figure 56. Ligature with more than two notes with recta and obliqua

```
<ligature form="recta">
  <note dur="longa" oct="3" pname="a"/>
  <note dur="longa" oct="4" pname="e"/>
  <note dur="semibrevis" lig="obliqua" oct="4" pname="d"/>
```

```
<note dur="semibrevis" lig="obliqua" oct="4" pname="c"/>
<note dur="brevis" oct="3" pname="b"/>
<note dur="brevis" oct="4" pname="e"/>
</ligature>
```

Listing 226.

DEVELOPMENT  
VERSION

## 5.5 Music Data Organization

The data organization based on `<measure>` elements that usually prevails in MEI is not appropriate for mensural notation because most music until 1600 does not have measures (bars) as we understand them today. Even though it is not defined by the mensural module, a more suitable alternate data organization without measures is available: `<staff>` elements may occur directly within the `<section>` element without being organized into measures first. The organization of events (notes, rests, etc.) within the `<staff>` and `<layer>` elements remains unchanged.

```
<section>
  <staff n="1">
    <layer>
      <note dur="longa" oct="5" pname="c" />
      <note dur="brevis" oct="4" pname="g" />
      <note dur="brevis" oct="4" pname="e" />
    </layer>
  </staff>
  <staff n="2">
    <layer>
      <note dur="maxima" oct="3" pname="c" />
    </layer>
  </staff>
</section>
```

Listing 227.

This feature may also be used to encode measured music without using the `<measure>` element. That is, the same data organization described above may be used, but with the addition of bar lines, indicated by the `<barLine>` element, for those situations where a measure-by-measure organization is not appropriate, for example, when measures are not coincident in all the staves of a score.

## 5.6 Other Features

Other features included in the MEI schema that allow for the encoding of various mensural notation properties are presented below:

### 5.6.1 Notation Type

The `notationtype` attribute, part of the MEI module, can be used within the `<staffDef>` element to specify which dialect of mensural notation is in use.

<code>notationtype</code> ( <a href="#">att.notationType</a> )	Contains classification of the notation contained or described by the element bearing this attribute.
-------------------------------------------------------------------	-------------------------------------------------------------------------------------------------------

At the moment, three values are in use for mensural notation:

- mensural** For mensural notation in general
- mensural.black** For black mensural notation, this is in reference to the use of filled-in note heads
- mensural.white** For white mensural notation, this is in reference to the use of void note heads, which became most widely used in the Renaissance period

The values of the `notationtype` attribute can indicate notation types other than mensural, such as common (Western) music notation, neume notation, and tablature.

The attribute `notationsubtype` can be used, together with the `notationtype` attribute, to provide more specificity regarding the type of notation encoded. This attribute can be used, for example, to specify if a piece in black mensural notation (`notationtype=mensural.black`) is written in *Ars antiqua* or *Ars nova* style. Currently, the values allowed in the `notationsubtype` attribute consist of any sequence of characters provided by the user.

<code>notationsubtype</code> ( <a href="#">att.notationType</a> )	Provides any sub-classification of the notation contained or described by the element, additional to that given by its <code>notationtype</code> attribute.
----------------------------------------------------------------------	-------------------------------------------------------------------------------------------------------------------------------------------------------------

*Important:* An element with a `notationsubtype` attribute must have a `notationtype` attribute.

### 5.6.2 Stems

The characteristics of a note's stem can be encoded within the `<note>` element, using the attributes:

<code>stem.dir</code> ( <a href="#">att.stems</a> )	Describes the direction of a stem.
<code>stem.len</code> ( <a href="#">att.stems</a> )	Encodes the stem length.
<code>stem.pos</code> ( <a href="#">att.stems</a> )	Records the position of the stem in relation to the note head(s).
<code>stem.x</code> ( <a href="#">att.stems</a> )	Records the output x coordinate of the stem's attachment point.
<code>stem.y</code> ( <a href="#">att.stems</a> )	Records the output y coordinate of the stem's attachment point.
<code>stem.form</code> ( <a href="#">att.stems.mensural</a> )	Records the form of the stem.

[include example (image and code) of a note with one stem that includes many of these attributes]

Sometimes notes have two stems. In this case, the `<stem>` element can be used as a child of `<note>` to define the individual characteristics of each stem with the following attributes:

**<stem>** A stem element.

dir (att.stem.vis)	Describes the direction of a stem.
form (att.stem.vis)	Encodes the form of the stem using the values provided by the data.STEMFORM.mensural datatype.
len (att.stem.vis)	Encodes the stem length.
pos (att.stem.vis)	Records the position of the stem in relation to the note head(s).
flag.form (att.stem.vis)	Encodes the form of the flag using the values provided by the data.FLAGFORM.mensural datatype.
flag.pos (att.stem.vis)	Records the position of the flag using the values provided by the data.FLAGPOS.mensural datatype.

- x      Encodes an x coordinate for a feature in an output coordinate system. When it is necessary to record the placement of a feature in a facsimile image, use the `facs` attribute.
- y      Encodes a y coordinate for a feature in an output coordinate system. When it is necessary to record the placement of a feature in a facsimile image, use the `facs` attribute.

[include example (image and code) of a note with two stems]

### 5.6.3 Plicas

Plicas can be encoded using the `<plica>` element as a child of `<note>`. The direction of the plica, as well as its length, can be encoded using the following visual-domain attributes:

**<plica>** Plica

dir (att.plica.vis)	Describes the direction of a stem.
len (att.plica.vis)	Encodes the stem length.

	<pre>&lt;note dur="brevis" pname="c" oct="3"&gt;   &lt;plica dir="up"/&gt; &lt;/note&gt;</pre>
	<pre>&lt;note dur="brevis" pname="c" oct="3"&gt;   &lt;plica dir="down"/&gt; &lt;/note&gt;</pre>
	<pre>&lt;note dur="longa" pname="c" oct="3"&gt;   &lt;plica dir="up"/&gt; &lt;/note&gt;</pre>
	<pre>&lt;note dur="longa" pname="c" oct="3"&gt;   &lt;plica dir="down"/&gt; &lt;/note&gt;</pre>

Figure 57. Encoding and rendering of plicas

#### 5.6.4 Dots

Dots of division and augmentation can be encoded by using the `<dot>` element (provided by the MEI.shared module). This element is meant to be used as a child of `<layer>` following the `<note>` or `<rest>` after which it appears in the original source.

Dots in mensural notation are not encoded as children of notes or rests, but rather as a sibling of these. They are also not encoded as attributes (the use of the dot attribute in a `<note>` or `<rest>` element is only acceptable in Common Music Notation, not mensural).

To indicate the nature of the dot (as a dot of division or augmentation), the `<dot>` element has an attribute form, which can take on the following values:

- aug** Value of the form attribute for a dot of augmentation (this is a dot that adds half the value to the previous note, like a dotted note in common Western music notation)
- div** Value of the form attribute for a dot of division (this is a dot that modifies the perfect groupings of the notes, thus, changing some notes' duration in the process)

The actual effect of these dots (*augmenting* a note and making it perfect, or dividing a sequence of notes in different groupings by *imperfecting* some notes or *altering* others) is encoded with the dur.quality attribute of the corresponding note elements. Examples of the use of dots of division and augmentation can be found in the [5.1.1 Alteration and Imperfection](#) section.

### 5.6.5 Accidentals

[explain that accidentals are usually encoded as independent elements and that accid.ges can be used within notes]

### 5.6.6 Coloration

[explain where/how coloration can be encoded]

### 5.6.7 Custos

[explain that there is a custos element available]

DEVELOPMENT  
VERSION

# 6 Répertoire: Neume Notation

This chapter describes the elements, model classes, and attribute classes that are part of the MEI.neumes module.

## 6.1 Overview of the Neumes Module

The MEI Neumes Module represents the community's attempt to create a standardized set of rules that encapsulate in a logical, systematic, and unequivocal way the musical information represented and conveyed by Western European neumatic notations (beginning with the late ninth century and continuing to the printed books of the twentieth). Most neume notation is used to set music to an existing text. The syllable is the fundamental unit of structure, with the neumes themselves serving as a means of "sonifying" the text. A syllable may be expressed via one or more neumes, with the particular neume shape chosen depending on the pitch contour that is being employed and the desired interpretation.

The `syllable` element is used as the primary organizational element for neume notation within a `layer` element. Within `syllable`, the `syl` element defined in the `MEI.shared` module is used for encoding the textual content, while the `neume` and `nc` elements are used to encode the neumes themselves. Within these Neumes Module elements, other standard MEI mechanisms are available to accommodate, for example, editorial or critical markup.

### 6.1.1 Basic four elements

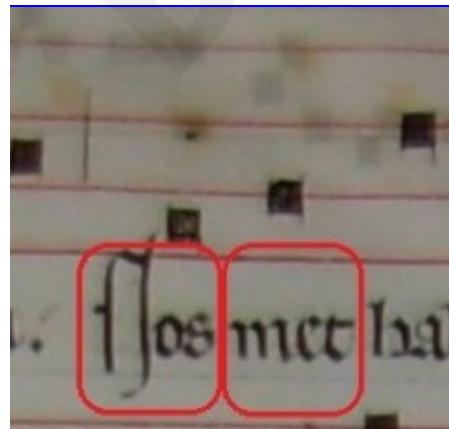

The following four elements are the fundamental components of the Neumes Module:

**<syllable>** Neume notation can be thought of as "neumed text". Therefore, the syllable element provides high-level organization in this repertoire.

Neume notation can be thought of as "neumed text". Therefore, the syllable element provides high-level organization in this repertoire.

**<syl>** Individual lyric syllable.

(syllable) – Individual lyric syllable.

---

Figure 58.

**<neume>** Sign representing one or more musical pitches.

Sign representing one or more musical pitches. As such, a **neume** consists of one or more **nc** element(s):

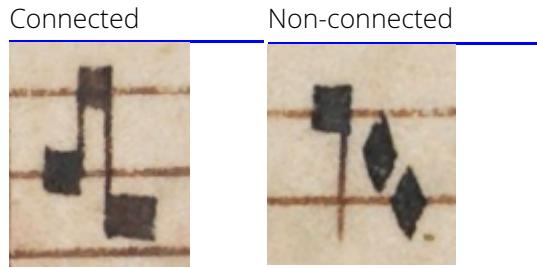

Figure 59. Connected Figure 60. Non-connected

---

**<nc>** Sign representing a single pitched event, although the exact pitch may not be known.

Sign representing a single pitched event, although the exact pitch may not be known. Examples of neume components are:

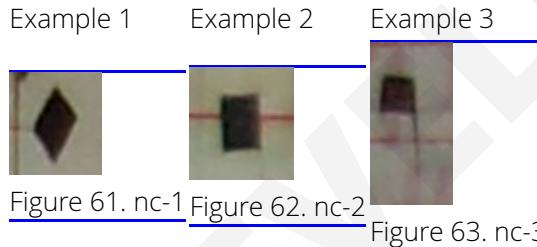

Figure 61. nc-1

Figure 62. nc-2

Figure 63. nc-3

---

## 6.2 Neumes Module Background

Neume encoding in MEI was initially developed as part of the [Hildegard von Bingen project](#) at the University of Tübingen. MEI was chosen as the basic representation format after a [comparison of existing music encoding formats](#). The initial work on this module was performed by Gregor Schräder ([Ein XML-Datenformat zur Repräsentation kritischer Musikedition unter besonderer Berücksichtigung von Neumennotation](#)), supervised by Prof. Stefan Morent. Since 2012 a group of scholars has been working on the development of a new version of the MEI schema for neume notations (Ichiro Fujinaga, Jennifer Bain, Debra Lacoste, Kate Helsen, and Inga Behrendt). Afterwards, other chant scholars joined the group bringing further expertise on other kinds of early music notations (namely [Elsa De Luca](#), Alessandra Ignesti, and Sarah A. Long).

## 6.3 Neume Notation and MEI

There are four main challenges in encoding Western European early music. The first relates to the fact that early notation was just a mnemonic aid that helped the readers to recall the music they already knew by heart and, as such, it conveys only partial musical information (Bain, Behrendt, & Helsen 2014; Helsen, Behrendt, & Bain 2017). Indeed, it is only with the invention of staff lines in the eleventh century that the system of musical transmission gradually changed, relying more on the written record rather than on orality. The second challenge refers to the existence of different regional styles of early notation; early-music manuscripts display a great graphical variety of musical signs, which include both neumes and other notational elements conveying further musical information (e.g., significative letters, Old Hispanic ticks, etc.). Thirdly, some of those regional notational styles occasionally share graphically similar shapes; these similar shapes within the different notational styles are understood by modern scholars to represent the same, a similar, or even a *different* musical meaning. Finally, while on occasion the neume shapes appear to mirror graphically the musical characteristics of the sound being represented (e.g., pen-stroke going up = rising melody), in many instances it is generally understood that the meaning attached to the neumes (or the other notational elements) may not be so straight-forward, but instead was ruled by conventions shared by the people who knew orally the musical repertory being fixed in written form by means of notation.

*What do these challenges entail for modern encoders?*

Firstly, sometimes we have to deal with written signs whose meaning is obscure to us and, while we can infer the meaning of some of those signs from the study of later manuscripts with the same melodies and a more precise notation, in other cases we need to turn to music palaeographers who examine the recurrence of those written signs and the context where they were used. By analysing scribal hands in particular manuscripts, palaeographers can often work out if a written sign is a meaningless scribal variant or a graphical feature conveying musical meaning to the medieval reader. Secondly, since a neume shape could either mirror on the page the aural event or bear some other musical meaning attached by convention, the encoding sometimes relies on the visual level or on the semantic level, and this distinction has to be made on a case-by-case basis. Moreover, since the same written sign could have multiple interpretations according to the style of notation where it was employed, it is crucial to be aware of the conventions of each regional notational alphabet in order to capture the musical information conveyed by that sign in the contexts where it is found.

See two examples of shapes found in different regional styles that are not captured with the same encoding:

*Example 1*

*St Gall notation* Oriscus (one-note ornamental neume). The oriscus is the middle note of a three-note raising gesture (commonly called *\_salicus\_* in the literature).

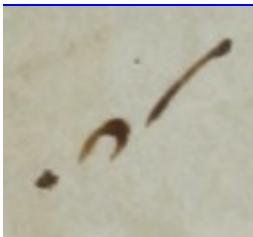

Figure 64.

```
<neume>
  <nc>
    <oriscus/>
  </nc>
  <nc tilt="ne" intm="u"/>
</neume>
```

Listing 228.

*Old Hispanic notation:* Two-note downward melodic gesture.

Figure 65.

```
<neume>
  <nc tilt="ne"/>
  <nc curve="c" tilt="s" intm="d"/>
</neume>
```

Listing 229.

*Example 2*

*Old Hispanic notation:* Four-note neutral-low-high-low melodic gesture.

Figure 66.

```
<neume>
  <nc tilt="ne"/>
  <nc tilt="se" intm="d"/>
  <nc tilt="ne" intm="u"/>
  <nc tilt="se" intm="d"/>
</neume>
```

Listing 230.

*Aquitanian notation:* Three-note rising neume with oriscus on the second note.

Figure 67.

```
<neume>
  <nc>
    <oriscus/>
  </nc>
  <nc tilt="ne" intm="u"/>
</neume>
```

Listing 231.

A further complication is that while the music encoding aims to narrow down and capture the meaning of the neumes in a logical and coherent system, occasionally the significance of some neumes is under debate (e.g., [<quilisma>](#)) and, despite its aim for accuracy, the encoding must remain open for future interpretations. From all these challenges has arisen the need for an early music encoding standardisation, that is, a set of rules that work for the description of any neume across all early notations regardless of the different methodologies applied to the study of individual notations and their idiosyncrasies.

Broadly speaking, Western early notations belong to two categories. On one side we have notations where two or more notes were represented by a single pen-stroke, while on the other side there are notations where the notes are graphically separated by means of discrete dots or short pen-strokes. These distinctions have been described even within single notational styles as interrupted neumes `<ineume>' or uninterrupted `<uneume>' (Morent & Schräder 2008; Morent 2011; MEI Guidelines v3, ch. 6: Neume Notation), and now as gapped or not gapped (Behrendt, Bain, & Helsen 2017; MEI Guidelines v4, ch. 6: Neume Notation). To date, the MEI Neumes Module has been tested mainly on stroke notations (St. Gall, Old Hispanic, etc.), but also on Aquitanian point-notation.

## 6.4 Samples of MEI encodings

### 6.4.1 Elements

<neume> and <nc> are the most common elements used in the MEI Neumes module. In the following examples we can see how these elements are used to describe sung gestures of 1, 2, and 4 notes in square notation.

One pitch - Staff notation. Example A

Figure 68. One pitch

```
<neume>
  <nc pname="f" oct="3"/>
</neume>
```

Listing 232.

One pitch - Staff notation. Example B

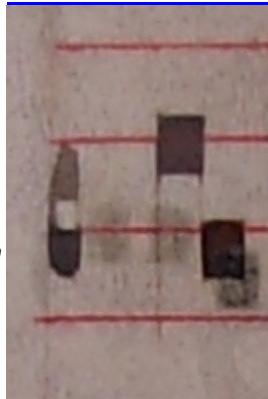

Figure 69. One pitch

  <nc pname="c" oct="3"/>
</neume>
```

Listing 233.

---

*Two pitches - Staff notation*

Figure 70. Two pitches

---

```
<neume>
  <nc pname="e" oct="3" tilt="n"/>
  <nc pname="c" oct="3"/>
</neume>
```

Listing 234.

---

*Four pitches - Staff notation*

Figure 71. Four pitches

```
<neume>
  <nc pname="a" oct="3"/>
  <nc pname="b" oct="3"/>
  <nc pname="g" oct="3" tilt="se" con="g"/>
  <nc pname="f" oct="3" tilt="se" con="g"/>
</neume>
```

Listing 235.

In addition to `<neume>` and `<nc>` the following elements are also frequently used in the MEI Neumes Module: `<custos>`, `<episema>`, `<hispanTick>`, `<liquecent>`, `<ncGrp>`, `<oriscus>`, `<quilisma>`, `<signifLet>`, `<strophicus>`. Note that `<nc>`, `<episema>`, `<hispanTick>`, and `<signifLet>` are `<neume>` elements. Instead `<oriscus>`, `<liquecent>`, `<quilisma>`, and `<strophicus>` are elements that must be part of a `<nc>` element. The `<custos>` is an element that is encoded inside the `<syl>` element. Furthermore, there are many other elements such as Editorial and Metadata elements that are not specific to Neumes and are not listed here.

`<custos>`: to indicate a symbol placed at the end of a line of music to indicate the first note of the next line. Sometimes called a "direct" (see MEI encoding of `<custos>` below).

`<mdiv>`: to indicate pause between neumes

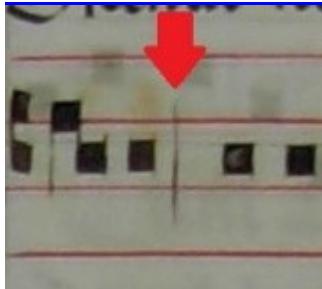

Figure 72.

<episema>: to indicate an episema (see MEI encoding of <episema> below).

---

Figure 73.

---

<hispanTick>: to indicate Old Hispanic ticks (see MEI encoding of <hispanTick> below).

---

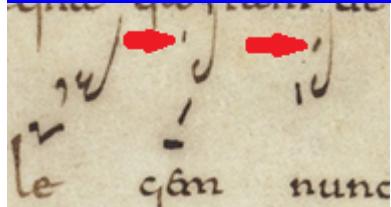

Figure 74.

---

<liquefiant>: to indicate a liquefiant (see MEI encoding of <liquefiant> neumes below).

---

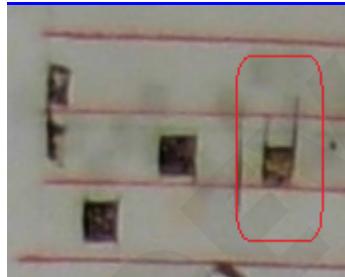

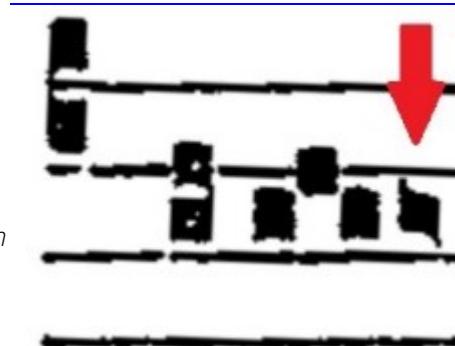

Figure 75.

---

<ncGrp>: to indicate multiple <nc>s.

<oriscus>: to indicate an oriscus.

ORISCUS - Square notation

Figure 76. Oriscus1

```
<neume>
  <nc oct="3" pname="g">
    <oriscus/>
  </nc>
</neume>
```

  <nc pname="a" oct="3" ligated="true"/>
  <nc pname="c" oct="4"/>
  <nc pname="c" oct="4">
    <strophicus/>
  </nc>
  <nc pname="c" oct="4">
    <strophicus/>
  </nc>
</neume>

```

Listing 238.

#### 6.4.2 Neume component attributes

pname ([att.nc.log](#)) Contains a written pitch name.

oct ([att.nc.log](#)) Captures written octave information.

intm  
 ([att.intervalMelodic](#)) Encodes the melodic interval from the previous pitch. The value may be a general directional indication (u, d, s, etc.), an indication of diatonic interval direction, quality, and size, or a precise numeric value in half steps.

con  
 ([att.ncForm](#)) Connection to the previous component within the same neume; this attribute should not be used for the first component of a neume.

GAPPED CONNECTION - Old Hispanic notation

Figure 81. Gapped

```

<neume>
  <nc tilt="e"/>
  <nc con="g" tilt="n" rellen="1" intm="u"/>
</neume>

```

Listing 239.

LOOPED CONNECTION - Old Hispanic notation

Figure 82. Looped

```
<neume>
<nc s-shape="s" />
<nc con="1" tilt="ne" intm="u" />
</neume>
```

Listing 240.

---

EXTENDED CONNECTION - Old Hispanic notation

Figure 83. Extended

```
<neume>
<nc tilt="ne" />
<nc curve="c" con="e" tilt="sw" relen="s" intm="d" />
</neume>
```

Listing 241.

---

Nota bene: the following neume has a similar shape but the neumatic connection is \_not\_ extended.

NON-EXTENDED CONNECTION - Old Hispanic notation

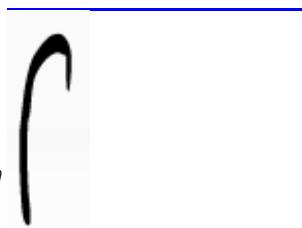

Figure 84. Non-extended

```
<neume>
  <nc tilt="n"/>
  <nc curve="c" tilt="s" relen="s" intm="d"/>
</neume>
```

Listing 242.

curve ([att.ncForm](#)) Records direction of curvature.

CURVE - Old Hispanic notation

Figure 85. Curve

```
<neume>
  <nc curve="c"/>
  <nc con="g" curve="a" intm="s"/>
</neume>
```

Listing 243.

angled ([att.ncForm](#))

ANGLED - *Old Hispanic notation*Figure 86. Angled

```
<neume>
  <nc tilt="e" />
  <nc angled="true" intm="u" />
  <nc angled="true" intm="u" />
  <nc tilt="n" rellen="1" intm="u" />
</neume>
```

Listing 244.

hooked ([att.ncForm](#)) Pen stroke has an extension; specific to Hispanic notation.

HOOK - *Old Hispanic notation*Figure 87. Hook

```
<neume>
  <nc tilt="ne" />
  <nc tilt="se" hooked="true" rellen="s" intm="d" />
</neume>
```

Listing 245.

ligated ([att.ncForm](#)) Indicates participation in a ligature.

{true | false} if this nc is part of a ligature. See the encoding of the [strophicus](#) example, above.

rellen Length of the pen stroke relative to the previous component within the same neume; this attribute ([att.ncForm](#)) should not be used for the first component of a neume.

RELATIVE LENGTH – Old Hispanic notation. Example A

Figure 88. Relative-Length-A

```
<neume>
  <nc tilt="ne"/>
  <nc tilt="se" rellen="s" intm="d"/>
</neume>
```

Listing 246.

RELATIVE LENGTH – Old Hispanic notation. Example B

Figure 89. Relative-Length-B

```
<neume>
  <nc tilt="ne"/>
  <nc tilt="se" rellen="l" intm="d"/>
</neume>
```

Listing 247.

tilt ([att.ncForm](#)) Direction of the pen stroke.

TILT – Old Hispanic / St Gall notation

Figure 90. Tilt

```
<neume>
  <nc tilt="ne"/>
```

```
</neume>
```

Listing 248.

---

s-shape      Direction of the initial direction for an s-shaped pen stroke; i.e., "w" for the standard letter S, "e" for (att.ncForm) its mirror image, "s" for the letter S turned 90-degrees anti-clockwise, and "n" for its mirror image.

S-SHAPE – Old Hispanic notation

Figure 91. S-shape-A

```
<neume>
  <nc s-shape="s" />
</neume>
```

Listing 249.

---

S-SHAPE – St Gall notation

Figure 92. S-shape-B

```
<neume>
  <nc s-shape="w">
    <oriscus/>
  </nc>
</neume>
```

Listing 250.

---

#### 6.4.3 Custos attributes

pname (att.pitch) Contains a written pitch name.

oct (att.octave) Captures written octave information.

loc (att.staffLoc) Holds the staff location of the feature.

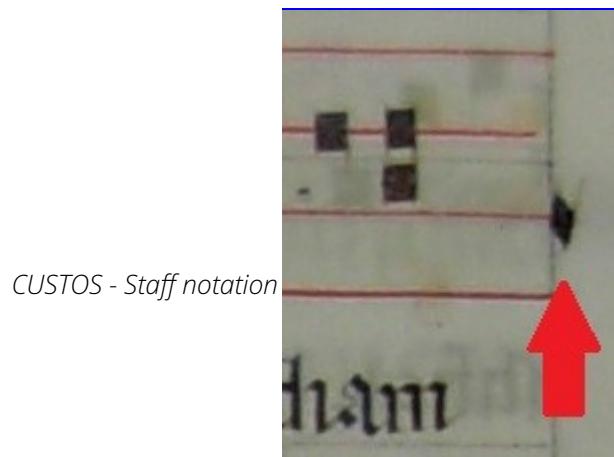

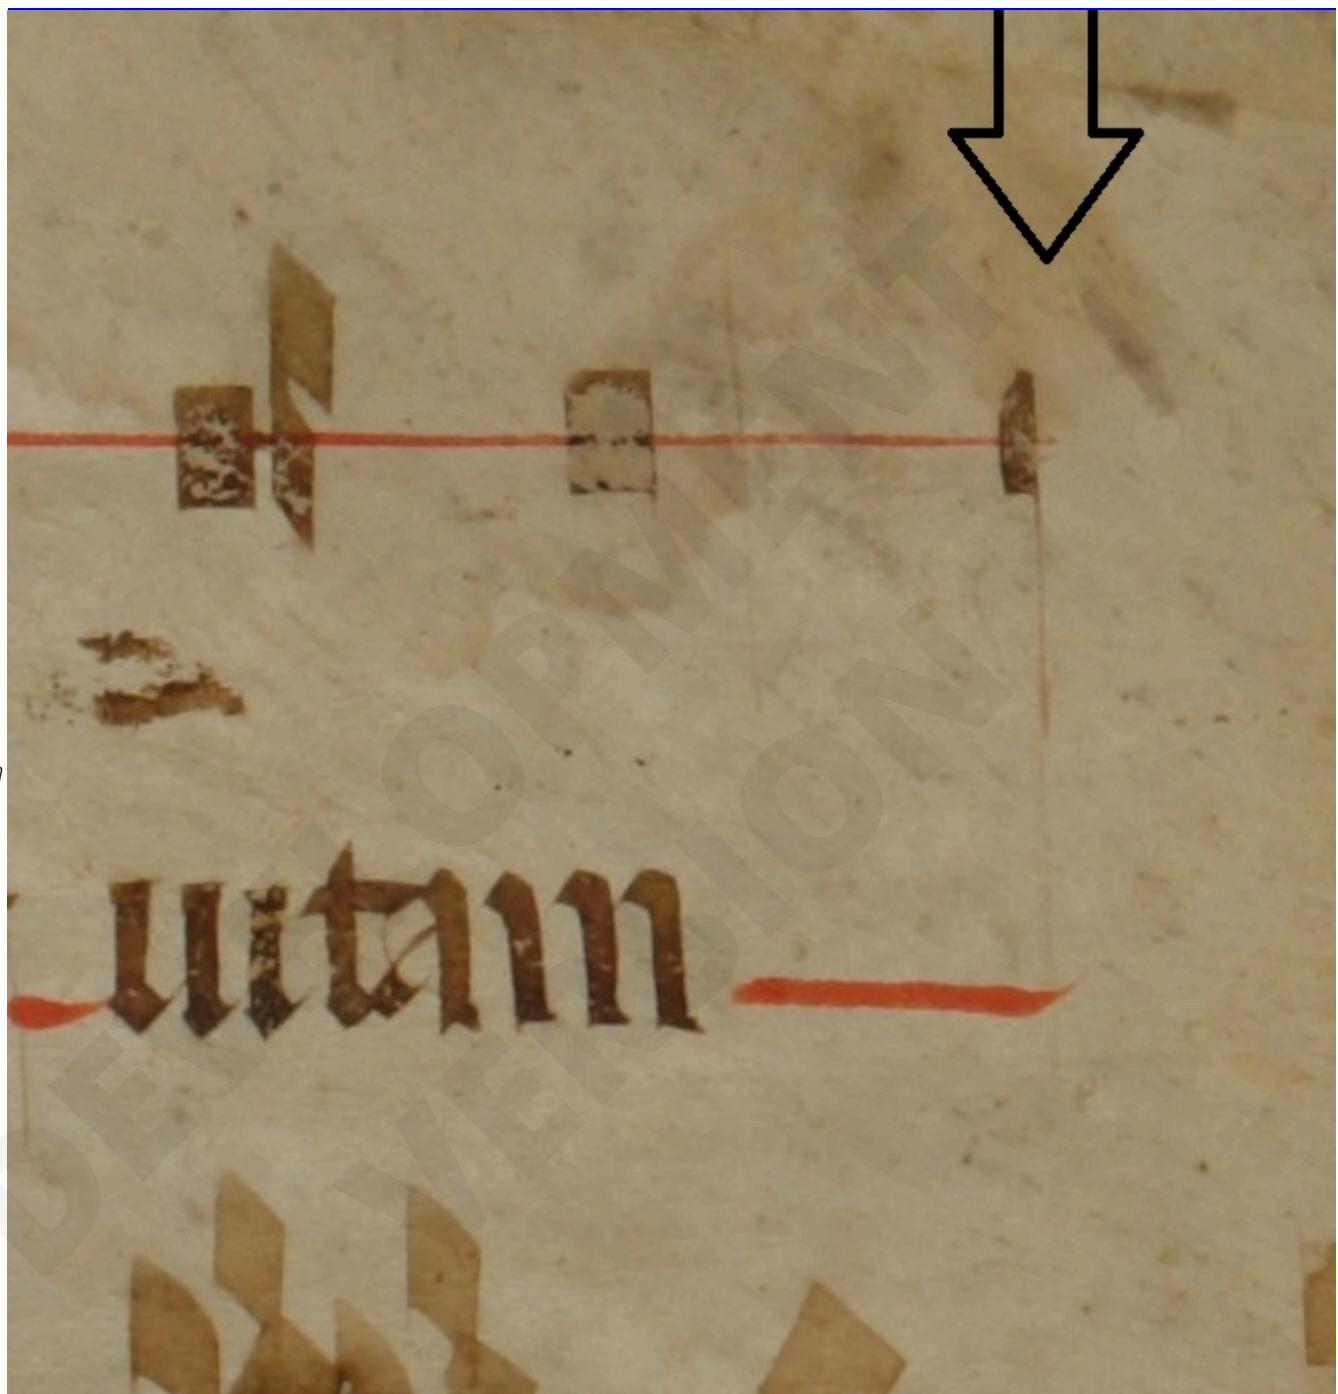

Figure 93. Custos1

---

```
<custos pname="f" oct="3"/>
```

Listing 251.

---

---

Figure 94. Custos2

```
<custos pname="c" oct="4"/>
```

Listing 252.

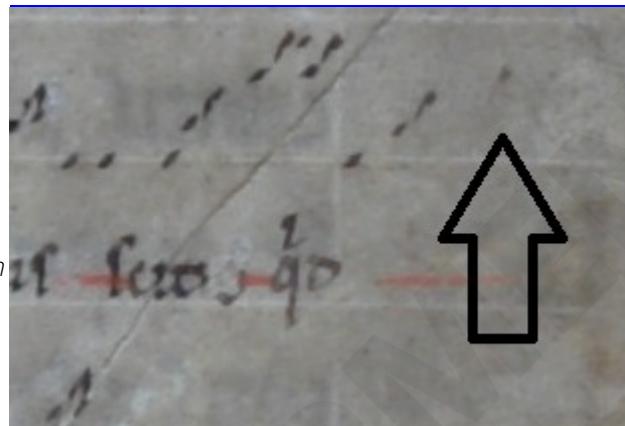

Figure 95. Custos3

```
<custos loc="+3"/>
```

Listing 253.

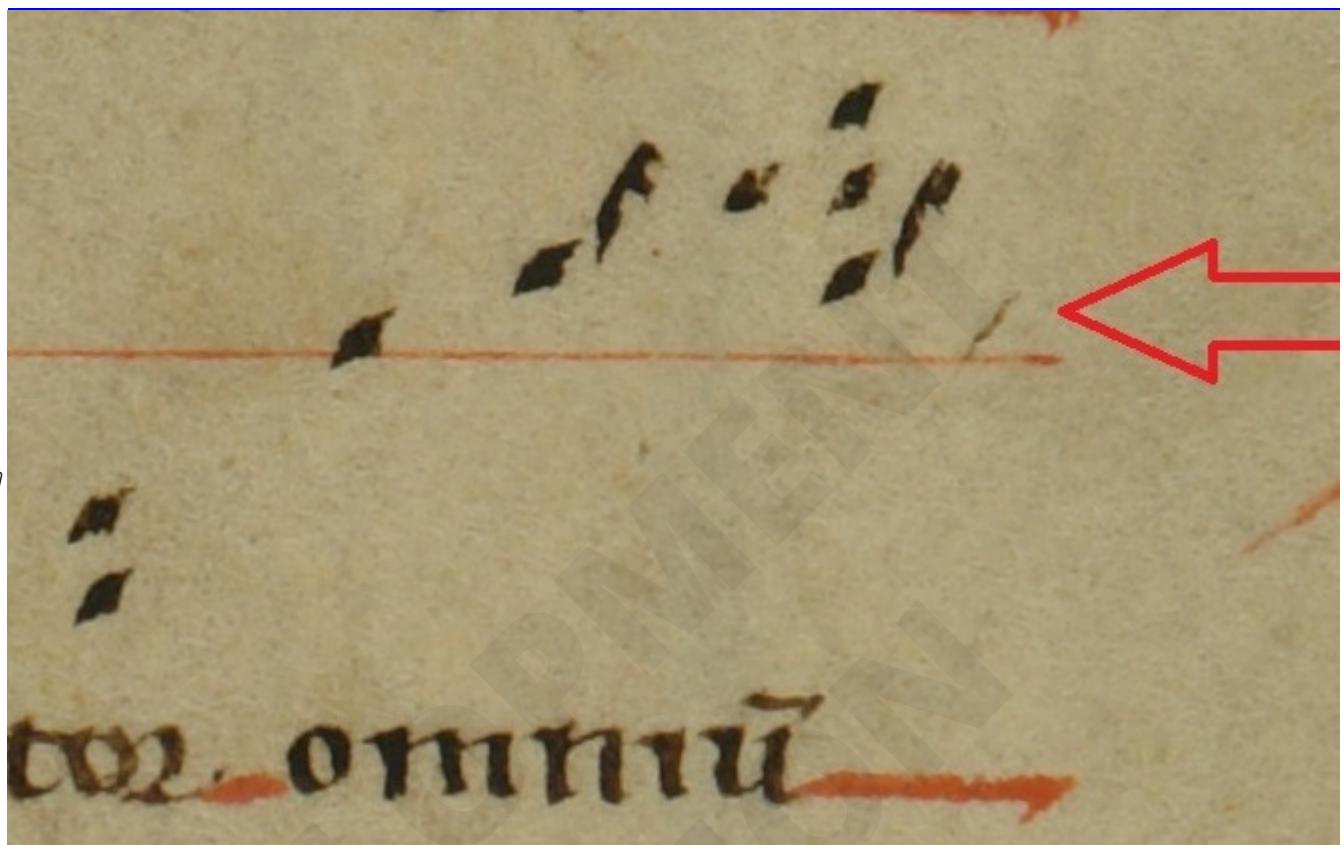

Figure 96. Custos4

---

```
<custos loc="0"/>
```

Listing 254.

---

Figure 97. Custos5

```
<custos pname="a" oct="4"/>
```

Listing 255.

Nota bene: in the last example we can read the exact pitch of the custos because the lozenged punctum (placed one step below the line) signals the lower note of the semitone E-F. This information, combined with the identification of the finalis of the piece, allows us to decipher the mode of this piece, that is the 4th.

#### 6.4.4 Episema attributes

form (att.episema.vis)

place (att.episema.vis) Captures the placement of the episema with respect to the neume or neume component with which it is associated.

EPISEMA - Staff notation

Figure 98. Episema-A

```
<neume>
  <nc pname="a" oct="4" tilt="s">
    <episema form="h" place="above"/>
  </nc>
  <nc pname="g" oct="4"/>
</neume>
```

Listing 256.

---

EPISEMA - St Gall notation. Example A

Figure 99. Pes rotundus episema

---

```
<neume>
  <nc curve="a"/>
  <nc intm="u" tilt="ne" rellen="1">
    <episema form="h" place="above-right"/>
  </nc>
</neume>
```

Listing 257.

---

EPISEMA - St Gall notation. Example B

Figure 100. Pes quadratus episema

---

```
<neume>
  <nc tilt="se"/>
  <nc intm="u" tilt="ne" rellen="1">
    <episema form="h" place="above-right"/>
  </nc>
</neume>
```

Listing 258.

---

EPISEMA - St Gall notation. Example C

Figure 101. Pes quassus episema

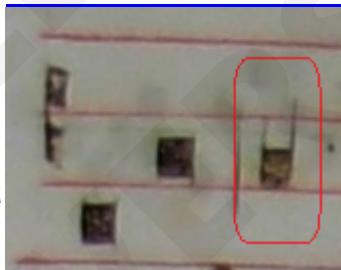

```
<neume>
  <nc s-shape="w"/>
  <nc intm="u" tilt="ne" relen="1">
    <episema form="v" place="above-right"/>
  </nc>
</neume>
```

Listing 259.

#### 6.4.5 Liquescent attributes

curve ([att.liquescent.vis](#)) Records direction of curvature.

looped ([att.liquescent.vis](#)) Indicates whether curve is closed.

LIQUESCENT - Staff notation. Example A

Figure 102. Liquescent.Ex.A

```
<neume>
  <nc curve="a" pname="b" oct="3">
    <liquescent/>
  </nc>
</neume>
```

Listing 260.

*LIQUESCENT - Staff notation. Example B*

Figure 103. Liquescent.Ex.B

```
<neume>
  <nc curve="c" pname="c" oct="4" tilt="n">
    <liquescent/>
  </nc>
</neume>
```

Listing 261.

---

*LIQUESCENT - Aquitanian notation*

Figure 104. Liquescent

```
<neume>
  <nc curve="c">
    <liquescent/>
  </nc>
</neume>
```

Listing 262.

---

#### 6.4.6 Old Hispanic tick attributes

tilt ([att.hispanTick.vis](#)) Direction toward which the mark points.

place Captures the placement of the tick mark with respect to the neume or neume component  
 (att.hispanTick.vis) with which it is associated.

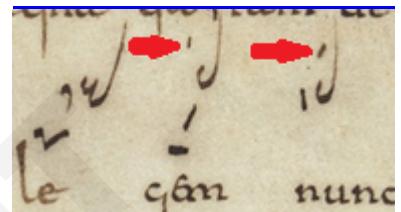

Figure 105. Hispan tick

```
<neume>
  <nc curve="a"/>
  <nc tilt="n" intm="u">
    <hispanTick tilt="n" place="above-right"/>
  </nc>
</neume>
```

Listing 263.

#### 6.4.7 Quilisma attribute

waves (att.quilisma.vis) Number of "crests" of a wavy line.

Figure 106. Quilisma

```
<neume>
  <nc pname="d" oct="4"/>
  <nc pname="e" oct="4"/>
```

```
<quilisma>
</nc>
<nc pname="f" oct="4"/>
<nc pname="e" oct="4"/>
</neume>
```

Listing 264.

QUILISMA - Old Hispanic notation

Figure 107. Quilisma2

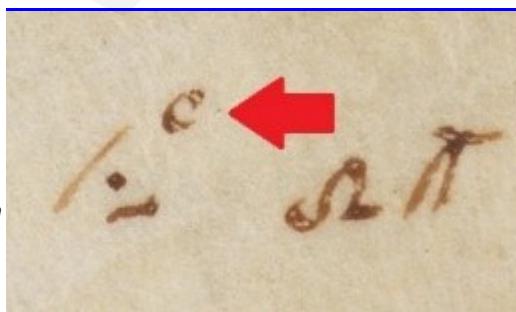

```
<neume>
  <nc>
    <quilisma waves="2"/>
  </nc>
  <nc tilt="n" intm="u"/>
  <nc tilt="se" rellen="1" intm="d"/>
</neume>
```

Listing 265.

#### 6.4.8 Significative letters attribute

place              Captures the placement of the sequence of characters with respect to the neume or neume  
(att.signifLet.vis) component with which it is associated.

SIGNIFICATIVE LETTERS - St Gall notation

Figure 108. Significative Letters

```
<neume>
  <nc tilt="ne">
    <signifLet place="above-right">c</signifLet>
  </nc>
  <nc con="g" rellen="s" intm="d"/>
  <nc con="g" tilt="e" rellen="l" intm="d"/>
</neume>
```

Listing 266.

### 6.4.9 Note

Other articulation marks such as ictus, circulus, semicirculus, accentus, and other fonts in SMuFL can be encoded using: glyph.auth, glyph.name, glyph.num, and glyph.uri.

### 6.4.10 Basic Encoding – Syllable

The following example illustrates the MEI encoding of the opening of Hildegarde's "O Splendidissima Gemma" with the text "O splendidissima". This example provides the basic MEI skeleton to have a valid MEI file and it may be used for reference for scholars willing to start encoding early music (and its text) in MEI. Information about the `<staff>` has been omitted for brevity, but it was originally encoded on a 5-line staff with two clefs, a "C" and a "F" on lines 5 and 3, respectively.

### 6.4.11 Manuscripts

Samples of MEI of St Gall notation are taken from the winter volume of the so-called "Hartker Antiphonary" CH-SGs Cod. Sang. 390.

Samples of MEI of Old Hispanic notation are taken from the "León Antiphoner" E-L MS 8.

Samples of MEI of Aquitanian notation are taken from sources on the [Portuguese Early Music Database](#).

# 7 Repertoire: String Tablature

This chapter describes the attribute classes that are part of the MEI.tablature module.

## 7.1 Overview of the Tablature Module

The tablature module is used to record basic tablature notation. It is designed primarily for guitar and similar plucked-string instruments.

The lines attribute on the `<staffDef>` element is used to define the number of lines, courses, or strings, present in the tablature. The `tab.strings` attribute is then used to enumerate the pitches of the open strings. It is important to note that this is given using the written pitch, not the sounding pitch. For example, the Western 6-string guitar, in standard tuning, sounds an octave below written pitch.

The `tab.strings` attribute gives the string tuning, ordered from highest to lowest pitch.

For standard guitar tuning, the `<staffDef>` element might look like this:

```
<staffDef lines="6" n="1" tab.strings="e5 b4 g4 d4 a3 e3"/>
```

Listing 268.

Chromatic alteration of the open string's pitch may be indicated with the '-' or 'f' (flat), or the '#' or 's' (sharp). Multiple sharps and flats are not permitted.

A guitar in E-flat tuning might look like this:

```
<staffDef lines="6" n="1" tab.strings="ef5 bf4 gf4 df4 af3 ef3"/>
```

Listing 269.

Some instruments, like the 12-string guitar, have the four lowest strings tuned an octave above but are still written on a 6-line tablature staff. In this case, you may enumerate the open string pitches while maintaining 6 lines.

```
<staffDef lines="6" n="1" tab.strings="e4 e3 a4 a3 d4 d3 g5 g4 b4 b4 e5 e5"/>
```

Listing 270.

The `<note>` element is used to capture the specific events in the tablature. The `tab.string` attribute is used to capture which string the note is to be played on. String order is the same as that given in the `tab.strings` attribute. This attribute takes a positive integer in the range of 1-9.

```
<note dur="4" oct="3" pname="a" tab.string="3"/>
```

Listing 271.

---

In the case of fretted instruments, the fret number may be captured using the tab.fret attribute. An open string may be indicated using the value 0 (zero).

---

```
<layer>
<note dur="4" oct="2" pname="a" tab.fret="5" tab.string="6"/>
<note dur="4" oct="2" pname="a" tab.fret="0" tab.string="5"/>
</layer>
```

Listing 272.

---

# 8 Lyrics and Performance Directions

This chapter describes how to encode words and syllables in vocal notation. This text is typically written under a staff to indicate the text to be vocally performed. As such, this text should not be confused with other text on the score, for which see chapter [9 Text Encoding](#).

## 8.1 Vocal Text

These guidelines suggest two methods for encoding text in vocal notation: encoding syllables as [8.3 Vocally Performed Text Encoded Within Notes](#) and encoding performed text as [8.4 Vocally Performed Text Encoded Separately](#) after the notes (and other staff events) either within `<layer>` elements or within `<measure>` elements when available (for example in a Common Music Notation context). Each method may be more convenient depending on the source text and on the textual phenomena that the encoding intends to record.

Both methods eventually rely on the `<syl>` element, which is part of the ‘shared’ module and is therefore available in all MEI files. The following sections will begin by introducing the general use of `<syl>` and then show in detail the two different encoding methods.

## 8.2 Lyric Syllables

By ‘lyric syllable’, these guidelines mean a word or portion of a word that is to be performed vocally. Each syllable is encoded with the `<syl>` element, with which it is also possible to specify the position of the syllable in a word, the type of connectors between syllables, alignment adjustments, and the formatting for each syllable. These are the key components:

**<syl>** Individual lyric syllable.

wordpos  
(att.syl.log) Records the position of a syllable within a word.

con (att.syl.log) Describes the symbols typically used to indicate breaks between syllables and their functions.

halign (att.horizontalAlign) Records horizontal alignment.

The attribute wordpos is used to specify the position of the marked-up lyric syllable in a word. It allows the following values:

- i** Indicates that the current syllable’s position is initial; that is, at the beginning of a word;
- m** Indicates that the current syllable is in the middle of a word;
- t** Indicates that the syllable’s position is terminal; that is, at the end of a word.

When a syllable is at the beginning or in the middle of a word (in which case it will have the wordpos attribute set to ‘i’ or ‘m’), it is recommended to specify the type of connector written between the current and the following syllable. This is expressed with the con attribute, which takes the following values:

- s** A space is used as a connector between syllables;
- d** A dash is used as a connector between syllables;
- u** An underscore sign (indicating prolongation of the syllable) is used as a connector between syllables;
- t** A tilde is used to indicate elision with the following syllable. This is typically rendered as a small curved line between the syllables.

Occasionally, a word or a final syllable needs to be extended across multiple notes. In this case an ‘extender’ is provided. An extender is a continuous line drawn at the text’s baseline from the end of the syllable associated with the first note until the last note to be sung with the syllable.

The use of `<syl>` described in this section is common to CMN and other notation systems, such as mensural notation. Other uses specific to certain types of notation and repertoires are addressed in other chapters. See for example [6 Repertoire: Neume Notation](#).

## 8.3 Vocally Performed Text Encoded Within Notes

Each lyric syllable can be encoded directly within an associated note, either by using the `syl` attribute on `<note>` or the `<verse>` element.

Using the `syl` attribute on notes is the simplest way of encoding vocally performed text and is recommended only for simple situations or for those encodings which do not focus on vocally performed text.

The following example from Handel's *Messiah* (HWV 56) shows the use of `syl`:

Hal - le - lu-jah,

Figure 110. Handel, Messiah HWV 56, Hallelujah

```

<measure>
  <staff>
    <layer>
      <note dots="1" dur="4" oct="5" pname="c" syl="Hal-"/>
      <note dur="8" oct="4" pname="g" syl="le-"/>
      <beam>
        <note dur="8" oct="4" pname="a" syl="lu-"/>
        <note dur="8" oct="4" pname="g" syl="jah,"/>
      </beam>
      <rest dur="4"/>
    </layer>
  </staff>
</measure>

```

Listing 273.

When there are multiple lines of vocally performed text, or the encoder wishes to be more specific about connectors, etc., the use of `<verse>` and `<syl>` is recommended.

**<verse>** Division of a poem or song lyrics, sometimes having a fixed length, meter or rhyme scheme; a stanza.

The following example from Handel's *Messiah* (HWV 56) shows the use of `<verse>`:

```
<measure>
  <staff>
    <layer>
      <note dots="1" dur="4" oct="5" pname="c">
        <verse n="1">
          <syl con="d" wordpos="i">Hal</syl>
        </verse>
      </note>
      <note dur="8" oct="4" pname="g">
        <verse n="1">
          <syl con="d" wordpos="m">le</syl>
        </verse>
      </note>
      <beam>
        <note dur="8" oct="4" pname="a">
          <verse n="1">
            <syl con="d" wordpos="m">lu</syl>
          </verse>
        </note>
        <note dur="8" oct="4" pname="g">
          <verse n="1">
            <syl wordpos="t">jah,</syl>
          </verse>
        </note>
      </beam>
      <rest dur="4"/>
    </layer>
  </staff>
</measure>
```

---

Listing 274.

As it is common practice in written text, it is assumed that a space separates words. Many vocal texts, however, introduce elisions and connect two syllables into one unit. For example, the vocal text from Mozart's *Don Giovanni* sung by Don Giovanni in Finale II, Ho fermo il core in petto introduces an elision between the word fermo and il and between core and in. An elision can be indicated by placing both syllables within the same `<note>` and setting the `<syl>` element's `con` attribute value to 't':

---

```
<note>
  <verse>
    <syl con="t" wordpos="t">re</syl>
    <syl wordpos="i">in</syl>
  </verse>
</note>
```

---

Listing 275.

When there is more than one line of text, more than one `<verse>` element can be used. The following example from a piano reduction of Wagner's *Rheingold* has two lines of text, with an English translation on the second line. Note the use of the `xml:lang` attribute to differentiate the two languages:

Figure 111. Example from Wagner's *Rheingold* with translated text.

```

      <rest dur="4" dur.ges="8p" />
    </layer>
  </staff>
</measure>
</section>
```

---

Listing 276.

Optionally, it is possible to include an `<lb>` element within `<verse>` to explicitly encode line and line group endings. This is specifically meant to facilitate karaoke applications.

Finally, the rhythm attribute can be used to specify a rhythm for the syllable that differs from that of the notes on the staff.

## 8.4 Vocally Performed Text Encoded Separately

Vocally performed text may also be encoded separately from the notes with the `<lg>` element. These are the main components:

`<lg>` May be used for any section of text that is organized as a group of lines; however, it is most often used for a group of verse lines functioning as a formal unit, e.g., a stanza, refrain, verse paragraph, etc.

`<l>` Contains a single line of text within a line group.

`staff` Signifies the staff on which a notated event occurs or to which a control event applies.

`(att.staffId)` Mandatory when applicable.

`layer (att.layerId)` Identifies the layer to which a feature applies.

Since this element is separated from the encoding of the notes, it must be associated with a staff that will provide rhythm information when required for automated processing. The staff attribute gives the associated staff and if there is more than one layer on that staff, the layer attribute may be used to indicate the layer from which the rhythm should be taken. If there is any divergence between the rhythm of the vocally performed text and the notes, the rhythm attribute on `<l>` may be used to specify the text's rhythm.

```

## 8.5 Drama

This section is supposed to explain stage directions and speeches in MEI drama.

DEVELOPMENT  
VERSION

DEVELOPMENT  
VERSION

## 9 Text Encoding

This chapter describes methods for encoding textual content with MEI. It is divided into section: One part deals with [9.1 Text Structures](#) in MEI, the other with [9.2 Text in MEI](#). While the first covers structures of textual documents such as front matter or back matter, the latter describes how to mark up features and various entities within a text, such as names, tables or quotes. These features may appear both within data (a `<fig>`ure scribbled as marginal `<annot>`ation into a score by a bored second violin...) and metadata (a number of `<date>`s within a text about the `<creation>` of a work). Accordingly, many of the elements and models explained in this chapter are used to encode [3 Metadata in MEI](#). However, they should not be confused with the elements from the [8 Lyrics and Performance Directions](#) chapter, which deals with *performed* text in MEI.

Most of the elements described here take inspiration from encoding formats that deal primarily with text, such as HTML and the Text Encoding Initiative (TEI). These elements are provided to encode relatively basic textual information. For deeper encoding of text, these Guidelines recommend consideration of other text-specific encoding formats with embedded MEI markup.

DEVELOPMENT  
VERSION

## 9.1 Text Structures

This chapter focuses on the text that accompanies the score, i.e., paratext (prefatory material, back matter, appendices, etc.).

### 9.1.1 Organizing Text into Divisions

Text can be organized in different parts, for example in chapters or sections. The `<div>` element is used to encode such structural divisions.

**<div>** Major structural division of text, such as a preface, chapter or section.

For example, printed scores, before the actual notation, can have text that can be organized in multiple sections (e.g., a preface, a critical report, performance instructions, etc. for which see the following sections); each of these sections should be identified by a different `<div>` element. Text might also occur in between music sections (see [2.1.2.2 Content of Musical Divisions](#)), for example in a collection of romantic piano works, a few pieces might be preceded or followed by poetry. Such text should be encoded with the `<div>` element, as demonstrated in the following example:

```
<mdiv>
  <score>
    <section>
      <!-- Score of Franz Liszt's "Sonetto 104 del Petrarca -->
    </section>
    <div>
      <!-- Text of Francesco Petrarca's Sonett n. 104. -->
      <lg>
        <l>L'aspectata vertù, che 'n voi fioriva</l>
        <l>quando Amor cominciò darvi bataglia,</l>
        <!-- ... -->
      </lg>
    </div>
  </score>
</mdiv>
```

---

Listing 278.

Textual divisions may have titles or other forms of introductory material, which are encoded with the `<head>` element.

**<head>** Contains any heading, for example, the title of a section of text, or the heading of a list.

The following example shows the encoding of a preface translated into three different languages, each with a different heading:

```
<front>
  <div xml:lang="en">
    <head>Preface</head>
    <!-- text -->
  </div>
  <div xml:lang="de">
    <head>Vorwort</head>
    <!-- text -->
  </div>
  <div xml:lang="it">
    <head>Prefazione</head>
    <!-- text -->
  </div>
</front>
```

Listing 279.

Having said that `<div>` identifies any structural organization of text, it is often helpful to distinguish the typology of division. The type attribute can be used for this purpose.

`type`      Characterizes the textual division in some sense, using any convenient classification scheme or typology  
`(<div>)`      that employs single-token labels.

`type` may contain any number of space-separated *tags* describing the nature of the `<div>` (or, in fact, any other element). The following example shows the use of `type` (in combination with `n`) to indicate three prefaces in English, German and Italian are columns on the same page.

```
<front>
  <div n="1" type="column" xml:lang="en">
    <head> Preface </head>
    <!-- text -->
  </div>
  <div n="2" type="column" xml:lang="de">
    <head>Vorwort</head>
    <!-- text -->
  </div>
  <div n="3" type="column" xml:lang="it">
    <head>Prefazione</head>
    <!-- text -->
  </div>
  <pb/>
</front>
```

Listing 280.

## 9.1.2 Paratext

This section introduces paratextual material, such as title pages, prefaces, indexes and other text that precedes or follows the actual score.

### 9.1.2.1 Front Matter

By ‘front matter’ these Guidelines mean distinct sections of a text (usually, but not necessarily, a printed one), prefixed to it by way of introduction or identification as a part of its production. Features such as title pages or prefaces are clear examples; a less definite case might be the prologue attached to a dramatic work. The front matter of an encoded text should not be confused with the MEI header described in chapter [3.2 Structure of the MEI Header](#), which provides metadata for the entire file.

An encoder may choose simply to ignore the front matter in a text, if the original presentation of the work is of no interest. No specific tags are provided for the various kinds of subdivision which may appear within front matter: instead, generic `<div>` (“division”) elements may be used, which should not be confused with `<mdiv>` (“musical division”) elements. The following suggested values for the type attribute may be used to distinguish various kinds of division characteristic of front matter:

- 'preface'** A foreword or preface addressed to the reader in which the author or publisher explains the content, purpose, or origin of the text.
- 'ack'** A formal declaration of acknowledgement by the author in which persons and institutions are thanked for their part in the creation of a text.
- 'dedication'** A formal offering or dedication of a text to one or more persons or institutions by the author.
- 'abstract'** A summary of the content of a text as continuous prose.
- 'contents'** A table of contents, specifying the structure of a work and listing its constituents. The list element should be used to mark its structure.
- 'frontispiece'** A pictorial frontispiece, possibly including some text.

The following extended example demonstrates how various parts of the front matter of a text may be encoded. The front part begins with a title page, which is presented in section [3.7.1 Title Pages](#), below. This is followed by a dedication and a preface, each of which is encoded as a distinct div:

---

```
<front>
  <titlePage>
    <!-- transcription of title page -->
  </titlePage>
  <div type="dedication">
    <p>
      <!-- Dedicatory text -->
```

```

</p>
</div>
<div type="preface">
  <head> Preface </head>
  <p>
    <!-- paragraph 1 -->
  </p>
  <p>
    <!-- paragraph 2 -->
  </p>
  <!-- additional material -->
</div>
</front>
```

Listing 281.

The front matter concludes with another `<div>` element, shown in the next example, this time containing a table of contents, which contains a `<list>` element (as described in chapter 9.2.4 Lists). Note the use of the `<ptr>` element to provide page-references: the implication here is that the target identifiers (`song1`, `song2`, etc.) will correspond with identifiers used for the `<mdiv>` elements containing the individual songs. (For a description of the `<ptr>` element, see chapter 13.2 Linking from MEI.)

```

<div type="contents">
  <head> Contents </head>
  <list form="ordered">
    <li>On Wenlock Edge
      <ptr target="#song1"/>
    </li>
    <li>From Far, From Eve and Morning
      <ptr target="#song2"/>
    </li>
    <li>Is My Team Ploughing?
      <ptr target="#song3"/>
    </li>
    <li>Oh, When I Was In Love With You
      <ptr target="#song4"/>
    </li>
    <li>Bredon Hill
      <ptr target="#song5"/>
    </li>
    <li>Clun
      <ptr target="#song6"/>
    </li>
  </list>
</div>
```

Listing 282.

Alternatively, the pointers in the table of contents might link to the page breaks at which a song begins, assuming that these have been included in the markup:

---

```
<list form="ordered">
  <li>On Wenlock Edge
    <ref target="#song1-p1">1</ref>
  </li>
  <li>From Far, From Eve and Morning
    <ref target="#song2-p15">15</ref>
  </li>
  <!-- .... -->
</list>
<!-- Later in the document -->
<mdiv type="song">
  <pb xml:id="song1-p1"/>
  <!-- .... -->
</mdiv>
<mdiv type="song">
  <pb xml:id="song2-p15"/>
  <!-- .... -->
</mdiv>
<!-- .... -->
```

Listing 283.

---

### 9.1.2.2 Back Matter

Conventions vary as to which elements are grouped as back matter and which as front. For example, some books place the table of contents at the front, and others at the back. For this reason, the content models of the `<front>` and `<back>` elements are identical.

The following suggested values may be used for the type attribute on all division elements, in order to distinguish various kinds of divisions characteristic of back matter:

- 'appendix'** An ancillary self-contained section of a work, often providing additional but in some sense extra-canonical text.
- 'glossary'** A list of terms associated with definition texts ('glosses').
- 'notes'** A section in which textual notes are gathered together.
- 'bibliography'** A list of bibliographic citations.
- 'index'** Any form of index to the work.
- 'colophon'** A statement appearing at the end of a book describing the conditions of its physical production.

No additional elements are proposed for the encoding of back matter at present. Some characteristic examples follow; first, an index (for the case in which a printed index is of sufficient interest to merit transcription):

```
<back>
  <div type="index">
    <head> Index </head>
    <list type="index">
      <li>a2, a3, etc., 175-176</li>
      <li>Abbreviations, 3
          <list type="index">
            <li>Percussion, 205-213</li>
            <li>Strings, 307</li>
          </list>
        </li>
        <li>Afterbeats, 77</li>
      </list>
    </div>
  </back>
```

Listing 284.

Note that if the page breaks in the original source have also been explicitly encoded, and given identifiers, the references to them in the above index can more usefully be recorded as links. For example, assuming that the encoding of page 77 of the original source starts like this:

```
<pb xml:id="text.P77"/>
```

Listing 285.

then the last item above might be encoded more usefully in the following form:

```
<li>Afterbeats,
  <ref target="#text.P77">77</ref>
</li>
```

Listing 286.

## 9.2 Text in MEI

This chapter describes methods for encoding textual content with MEI. Textual information on scores has several different uses, although some text is closer to music notation than other kinds. For example, tempo marks, directives and lyrics are directly related to the functionality of the notated music and are, therefore, described in other chapters (see for example [8.1 Vocal Text](#) and [2.2.5.1 Text Directives](#)).

Most of the elements described here take inspiration from encoding formats that deal primarily with text, such as HTML and the Text Encoding Initiative (TEI). These elements are provided to encode relatively basic textual information. For deeper encoding of text, these Guidelines recommend consideration of other text-specific encoding formats with embedded MEI markup.

### 9.2.1 Paragraphs

Paragraphs are fundamental to prose text and typically group one or more sentences that form a logical passage. Usually, it is typographically distinct; that is, it usually begins on a new line and the first letter of the content is often indented, enlarged, or both. This element has a similar meaning as the corresponding elements in Encoded Archival Description (EAD), Text Encoding Initiative (TEI), and HTML.

A paragraph is encoded with the `<p>` element:

**<p>** One or more text phrases that form a logical prose passage.

Prose text is used for several different purposes within a MEI document, therefore `<p>` can occur in many situations. For example, it may be used within metadata elements (see [3.2 Structure of the MEI Header](#)):

```
<samplingDecl>
  <p>The encoding contains only the first 5 measures.</p>
</samplingDecl>
```

---

Listing 287.

---

Alternatively, paragraphs may be part of the document contents (and therefore encoded within `<music>`), either as [9.1.2 Paratext](#) or within the music notation. In these cases, a paragraph will likely be contained by a `<div>` or other elements containing prose (e.g., `<annot>`, `<figDesc>`, etc.).

The following example shows a paragraph in a preface section:

---

```
<front>
  <div>
    <head> The Preludes
    <lb/>
```

```
Symphonic Poem No.3 by F. Liszt. </head>
```

```
<p>What else is our life but a series of preludes to that unknown Hymn, the first and solemn  
note of which is intoned by Death? </p>
```

```
</div>
```

```
</front>
```

Listing 288.

## 9.2.2 Text Rendition

Sometimes, it is desirable to capture the typographical qualities of a word or phrase without assigning it a special meaning. For this purpose, MEI offers the `<rend>` element, similar to TEI's `hi` element. Using CSS-like values, its `rend` attribute can be used to specify many typographic features, such as font style, font variants, and relative font size and weight. In addition, text decoration, direction, and enclosing 'boxes' may be captured. While `rend` is used to record relative font size and weight, absolute values for these qualities (measured in printer's points) should be specified using the `fontsize` and `fontweight` attributes. In addition to commonly found typographical qualities, MEI provides the `altrend` attribute for the capture of additional, user-defined rendition information.

The `<rend>` element can accept `glyph.auth` and `glyph.uri` attributes, which provide encoders with the ability to specify an external authority for Unicode codepoints in the textual content. Only the text content that should be rendered using SMuFL code points should go inside the `<rend>` element when using `glyph.auth` and `glyph.uri`.

```
<rend> This is what a G clef looks like:  
<rend glyph.auth="smufl">&#xE050;</rend>  
</rend>
```

Listing 289.

**<rend>** A formatting element indicating special visual rendering, e.g., bold or italicized, of a text word or phrase.

`rend` (`att.textRendition`) Captures the appearance of the element's contents using MEI-defined descriptors.

`altrend` (`att.textRendition`) Used to extend the values of the `rend` attribute.

`fontname` (`att.typography`) Holds the name of a font.

`fontsize` (`att.typography`) Indicates the size of a font expressed in printers' points, i.e., 1/72nd of an inch, relative terms, e.g., small, larger, etc., or percentage values relative to normal size, e.g., 125%.

`fontstyle` (`att.typography`) Records the style of a font, i.e., italic, oblique, or normal.

`fontweight` (`att.typography`) Used to indicate bold type.

halign ([att.horizontalAlign](#)) Records horizontal alignment.

valign ([att.verticalAlign](#)) Records vertical alignment.

### 9.2.3 Figures

The [`<fig>`](#) element groups elements representing or containing graphic information such as an illustration or figure. This element is modelled on the figure element in the Text Encoding Initiative (TEI). The [`<fig>`](#) element is used to contain images, captions, and textual descriptions of the pictures. The images themselves are specified using the [`<graphic>`](#) element, whose target attribute provides the location of an image. For example:

---

```
<fig>
  <graphic target=".../samples/snippets/mei2012-30shortexamples/beam-grace/grace-300.png"/>
</fig>
```

Listing 290.

---

The graphic element may occur multiple times within the markup of the figure in order to indicate the availability of different image formats or resolutions:

---

```
<fig>
  <graphic target=".../samples/snippets/mei2012-30shortexamples/beam-grace/grace-72.png"/>
  <graphic target=".../samples/snippets/mei2012-30shortexamples/beam-grace/grace-300.png"/>
  <graphic target=".../samples/snippets/mei2012-30shortexamples/beam-grace/grace-600.png"/>
</fig>
```

Listing 291.

---

#### 9.2.3.1 Figure Captions and Descriptions

The element [`<caption>`](#) may be used to transcribe (or supply) a title or descriptive heading for the graphic itself, as in the following example:

---

```
<fig>
  <caption>Grace notes</caption>
  <graphic target=".../samples/snippets/mei2012-30shortexamples/beam-grace/grace-300.png"/>
</fig>
```

Listing 292.

---

The figure description (`<figDesc>`) element usually contains a brief prose description of the appearance or content of a graphic figure, for use when documenting an image, perhaps without displaying it. This element is intended for use as an alternative to the content of its parent `<fig>` element; for example, for display when the equipment in use cannot display graphic images. It may also be used for indexing or documentary purposes, in which case best practice suggests the use of controlled vocabulary terms.

```
<fig>
  <graphic target="emblem1.png"/>
  <caption>Emblemi d'Amore</caption>
  <figDesc>A pair of naked winged cupids, each holding a flaming torch, in a rural
  setting.</figDesc>
</fig>
```

Listing 293.

Occasionally, a figure description may have a complex structure. In this case, one or more textual component elements (`<p>` [paragraph], `<table>`, `<list>`, `<quote>`, or `<lg>` [linegroup]) may be used to model the internal structure of the description:

```
<fig>
  <caption>Grace notes</caption>
  <figDesc>
    <p>The example shows grace notes within beams ...</p>
    <p>This illustration was created by ...</p>
  </figDesc>
  <graphic target="../samples/snippets/mei2012-30shortexamples/beam-grace/grace-300.png"/>
</fig>
```

Listing 294.

### 9.2.3.2 Images

The `<graphic>` element indicates the location of an inline graphic, illustration, or figure. As noted above, there exists a wide variety of different graphics formats, and the following list is in no way exhaustive. Moreover, inclusion of any format in this list should not be taken as indicating endorsement by the MEI of this format or any products associated with it. Some of the formats listed here are proprietary to a greater or lesser extent and cannot therefore be regarded as standards in any meaningful sense. They are, however, widely used by many different vendors. The following formats are widely used at the present time, and are likely to remain supported by more than one vendor's software:

- BMP: Microsoft bitmap format
- CGM: Computer Graphics Metafile
- GIF: Graphics Interchange Format

- JPEG: Joint Photographic Expert Group
- PBM: Portable Bit Map
- PCX: IBM PC raster format
- PICT: Macintosh drawing format
- PNG: Portable Network Graphics format
- Photo-CD: Kodak Photo Compact Disk format
- QuickTime: Apple real-time image system
- SMIL: Synchronized Multimedia Integration Language format
- SVG: Scalable Vector Graphics format
- TIFF: Tagged Image File Format

Brief descriptions of all the above are given below. Where possible, current addresses or other contact information are shown for the originator of each format. Many formal standards, especially those promulgated by the ISO and many related national organizations (ANSI, DIN, BSI, and many more), are available from those national organizations. Addresses may be found in any standard organizational directory for the country in question.

#### 9.2.3.2.1 Vector Graphic Formats

<b>SVG (Scalable Vector Graphics format)</b>	SVG is a language for describing two-dimensional vector and mixed vector or raster graphics in XML. It is defined by the Scalable Vector Graphics (SVG) 1.0 Specification, W3C Recommendation, 04 September 2001, available at <a href="http://www.w3.org/TR/2001/REC-SVG-20010904/">http://www.w3.org/TR/2001/REC-SVG-20010904/</a> .
<b>PICT (Macintosh drawing format)</b>	This format is universally supported on Macintosh (tm) systems, and readable by a limited range of software for other systems. Documentation is available from Apple Computer, Cupertino, California USA.
<b>CGM (Computer Graphics Metafile)</b>	This vector graphics format is specified by an ISO standard, ISO 8632:1987, amended in 1990. It defines binary, character, and plain-text encodings; the non-binary forms are safer for blind interchange, especially over networks. Documentation is available from ISO and from its member national bodies, such as AFNOR, ANSI, BSI, DIN, JIS, etc.

#### 9.2.3.2.2 Raster Graphic Formats

<b>PNG (Portable Network Graphics format)</b>	PNG is a non-proprietary raster format currently widely available. It provides an extensible file format for the losslessly compressed storage of raster images. Indexed-color, grayscale, and true-color images are supported, plus an optional alpha channel. Sample depths range from 1 to 16 bits. It is defined by IETF RFC 2083, March 1997.
-----------------------------------------------	----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

<b>TIFF (Tagged Image File Format)</b>	Currently the most widely supported raster image format, especially for black and white images, TIFF is also one of the few formats commonly supported on more than one operating system. The drawback to TIFF is that it actually is a wrapper for several formats, and some TIFF-supporting software does not support all variants. TIFF files may use LZW, CCITT Group 4, or PackBits compression methods, or may use no compression at all. Also, TIFF files may be monochrome, greyscale, or polychromatic. All such options should be specified in prose at the end of the encodingDesc section of the MEI header for any document including TIFF images. TIFF is owned by Aldus Corporation. Documentation on TIFF is available from the owner at Craigcook Castle, Craigcook Road, Edinburgh EH4 3UH, Scotland, or 411 First Avenue South, Seattle, Washington 98104 USA.
<b>GIF (Graphics Interchange Format)</b>	Raster images are widely available in this form, which was created by CompuServe Information Services, but has by now been implemented for many other systems as well. Documentation is copyright by, and is available from, CompuServe Incorporated, Graphics Technology Department, 5000 Arlington Center Boulevard, Columbus, Ohio 43220 USA.
<b>PBM (Portable Bit Map)</b>	PBM files are easy to process, eschewing all compression in favor of transparency of file format. PBM files can, of course, be compressed by generic file-compression tools for storage and transfer. Public domain software exists which will convert many other formats to and from PBM. Documentation of PBM is copyright by Jeff Poskanzer, and is available widely on the Internet.
<b>PCX (IBM PC raster format)</b>	This format is used by most IBM PC paint programs, and supports both monochrome and polychromatic images. Documentation is available from ZSoft Corporation, Technical Support Department, ATTN: Technical Reference Manual, 450 Franklin Rd. Suite 100, Marietta, GA 30067 USA.
<b>BMP (Microsoft bitmap format)</b>	This format is the standard raster format for computer using Microsoft Windows (tm) or Presentation Manager (tm). Documentation is available from Microsoft Corporation.

### 9.2.3.2.3 Photographic and Motion Video Formats

<b>JPEG (Joint Photographic Experts Group)</b>	This format is sponsored by CCITT and by ISO. It is ISO/IEC Draft International Standard 10918-1, and CCITT T.81. It handles monochrome and polychromatic images with a variety of compression techniques. JPEG per se, like CCITT Group IV, must be encapsulated before transmission; this can be done via TIFF, or via the JPEG File Interchange Format (JFIF), as commonly done for Internet delivery.
<b>Photo-CD (Kodak Photo Compact Disk format)</b>	This format was introduced by Kodak for rasterizing photographs and storing them on CD-ROMs (about one hundred 35mm file images fit on one disk), for display on televisions or CD-I systems. Information on Photo-CD is available from Kodak Limited, Research and Development, Headstone Drive, Harrow, Middlesex HA1 4TY, UK.

## 9.2.4 Lists

When a text contains lists, they can be encoded with the following elements:

- <list>** A formatting element that contains a series of items separated from one another and arranged in a linear, often vertical, sequence.
- <head>** Contains any heading, for example, the title of a section of text, or the heading of a list.
- <item>** Single instance or exemplar of a source/manifestation.

The **<list>** element can identify any kind of list; the form attribute can be used to specify whether the list is ordered, unordered etc. Each item in the list is encoded with the **<li>** element. The n can be used to record a label for a list item, as in the following example:

---

```
<p>The modulation follows the following steps:<br/><list form="ordered"><li n="1">C major</li><li n="2">A minor</li><li n="3">D major seventh</li><li n="4">G major</li></list></p>
```

Listing 295.

---

Occasionally, lists have headers or titles, which can be encoded with **<head>**:

---

```
<list><head>Ornaments in different languages </head><li n="English" xml:lang="en">Turn</li><li n="Italian" xml:lang="it">Gruppetto</li><li n="French" xml:lang="fr">Gruppetto</li><li n="German" xml:lang="de">Doppelschlag</li></list>
```

Listing 296.

---

## 9.2.5 Tables

The element **<table>** contains text displayed in tabular form, i.e., in rows and columns. A table is the least ‘graphic’ of the elements discussed in this chapter. Almost any text structure can be presented as a series of rows and columns: one might, for example, choose to show a glossary or other form of list in tabular form, without necessarily regarding it as a table. When tabular presentation is regarded as of less intrinsic importance, it is correspondingly simpler to encode descriptive or functional information about the contents of the table, for example to identify one cell as containing a name and another as containing a date, though the two methods may be combined.

---

The `<table>` element may appear both within other components (such as paragraphs), or between them, provided that the module defined in this chapter has been enabled. It is to a large extent arbitrary whether a table should be regarded as a series of rows or as a series of columns. For compatibility with currently available systems, however, these Guidelines require a row-by-row description of a table.

While rows and columns are always encoded in top-to-bottom, left-to-right order, formatting properties such as those provided by CSS may be used to specify that they should be displayed differently.

### 9.2.5.1 Rows

The `<tr>` (table row) element is a formatting element that contains one or more `<td>` or `<th>` elements (cells) in a `<table>`. A cell is the intersection of a row and a column. The precise rendition of the table and its cells should be specified in a style sheet.

```

<table>
  <tr>
    <th colspan="7">Besetzungen der Triosonate und ihrer Nachfolger</th>
  </tr>
  <tr>
    <td/>
    <td>Triosonate
      <lb/>
      Standardbes. </td>
    <td>Triosonate für
      <lb/>
      Orgel (Bach) </td>
    <td>Sonate mit obl.
      <lb/>
      Cembalo (Bach) </td>
    <td>Klaviertrio</td>
    <td>Streichquartett</td>
    <td>Streichtrio</td>
  </tr>
  <tr>
    <td>1. Oberstimme</td>
    <td>1. Violine</td>
    <td>Orgel r.H.</td>
    <td>Violine
      <lb/>
      (Flöte, Gambe) </td>
    <td>Violine</td>
    <td>1. Violine</td>
    <td>1. Violine</td>
  </tr>
  <tr>
    <td>2. Oberstimme</td>
    <td>2. Violine</td>

```

```
<td>Orgel l.H.</td>
<td>Cembalo r.H.</td>
<td>Klavier r.H.</td>
<td>2. Violine</td>
<td/>
</tr>
<tr>
  <td>harmonische Füllung</td>
  <td>Cembalo r.H.</td>
  <td/>
  <td/>
  <td>Bratsche</td>
  <td>Bratsche</td>
</tr>
<tr>
  <td>Bass-Stimme</td>
  <td>Cello</td>
  <td>Orgel Pedal</td>
  <td>Cello</td>
  <td>Cello</td>
  <td>Cello</td>
</tr>
</table>
```

Listing 297.

### 9.2.5.2 Cells

The `<td>` (table data) element designates a table cell that contains data as opposed to a cell that contains column or row heading information. The `colspan` and `rowspan` attributes provide tabular rendering information. They indicate that a particular cell or row of a table spans more than one row or column.

---

```
<table>
<tr>
  <td colspan="2" rowspan="2">unmittelbares Schlagen</td>
  <td colspan="2" rowspan="2">mittelbares Schlagen</td>
</tr>
<tr>
  <td>Gegenschlag</td>
  <td>Aufschlag</td>
  <td>Schütteln</td>
  <td>Schrapen</td>
</tr>
<tr>
```

```

<td>1. Stäbe</td>
<td>1. Stäbe</td>
<td>1. Rahmen</td>
<td>1. Raspeln</td>
</tr>
<tr>
  <td>2. Platten</td>
  <td>2. Röhren</td>
  <td>2. Gefäße</td>
  <td>2. Räder</td>
</tr>
<tr>
  <td/>
  <td>3. Platten</td>
  <td>3. Reihen</td>
  <td/>
</tr>
<tr>
  <td/>
  <td>4. Gefäße</td>
  <td/>
  <td/>
</tr>
</table>

```

Listing 298.

The `<th>` (table header) element designates a table cell containing column or row heading information as opposed to one containing data. The `colspan` and `rowspan` attributes tabular display rendering information. They indicate that a particular cell or row of a table spans more than one row or column.

```

| Systematische Einteilung der Idiophone |           |                      |          |
|--|-----------|----------------------|----------|
| unmittelbares Schlagen                 |           | mittelbares Schlagen |          |
| Gegenschlag                            | Aufschlag | Schütteln            | Schrapen |
| 1. Stäbe                               |           |                      |          |

```

```
<td>1. Stäbe</td>
<td>1. Rahmen</td>
<td>1. Raspeln</td>
</tr>
<tr>
  <td>2. Platten</td>
  <td>2. Röhren</td>
  <td>2. Gefäße</td>
  <td>2. Räder</td>
</tr>
<tr>
  <td/>
  <td>3. Platten</td>
  <td>3. Reihen</td>
  <td/>
</tr>
<tr>
  <td/>
  <td>4. Gefäße</td>
  <td/>
  <td/>
</tr>
</table>
```

---

Listing 299.

## 9.2.6 Quotation

It is common, in many types of texts, to find quotations. A quotation is typically attributed to another text other than the one being encoded. Often, the quoted material is typographically distinct from the surrounding text; i.e., surrounded by so-called ‘quote marks’ or rendered as a separate block of text. The `<quote>` element is used to mark this function:

**<quote>** Contains a paragraph-like block of text attributed to an external source, normally set off from the surrounding text by spacing or other typographic distinction.

The following examples show the use of `<quote>`.

```
<p>Hugh MacDonald has argued that Liszt's Symphonic Poems were meant to
<quote>display the traditional logic of symphonic thought</quote>
. </p>
```

---

Listing 300.

<p>The majority of the works represented in this catalogue were purchased in Paris and London between 1928 and 1934. After graduating from Harvard in 1924, Mackay-Smith spent several years in Europe:

<quote>  
 <p>I bought my first early music from Harold Reeves in London in the summer of 1928 when I was able to acquire virtually all the 18th century editions, particularly of trio music, which he then had in stock, going back not only through his current but also through earlier catalogues, picking out numbers which remained unsold. It is almost a shame today to think of the prices at which such things were then available, one or two pounds apiece. </p>

</quote>

</p>

Listing 301.

## 9.2.7 Poetry

This **<lg>** (line group) element is used generically to encode any section of text that is organized as a group of lines. Following the recommendations of the Text Encoding Initiative, it is recommended to use it, along with the following elements, for marking up poetry:

**<lg>** May be used for any section of text that is organized as a group of lines; however, it is most often used for a group of verse lines functioning as a formal unit, e.g., a stanza, refrain, verse paragraph, etc.

**<head>** Contains any heading, for example, the title of a section of text, or the heading of a list.

**<l>** Contains a single line of text within a line group.

Because **<lg>** groups verses, it can be used to encode additional stanzas not integrated into the music notation. In addition, it is common for a poem to include a title or a header, as is demonstrated by the following example:

```
<mdiv>
  <score>
    <section>
      <!-- Score of Franz Liszt's "Sonetto 104 del Petrarca" -->
    </section>
    <div>
      <!-- Text of Francesco Petrarca's Sonett n. 104. -->
      <lg>
        <head> Sonetto 104 </head>
        <l>L'aspectata vertù, che 'n voi fioriva</l>
        <l>quando Amor cominciò darvi bataglia,</l>
        <l>produce or frutto, che quel fiore aguaglia,</l>
        <l>et che mia speme fa venire a riva.</l>
        <!-- ... -->
      </lg>
    </div>
  </score>
```

```
</mdiv>
```

Listing 302.

---

### 9.2.8 Names

The [<name>](#) element may be used to mark up portions of a text that function as name.

**<name>** Proper noun or noun phrase.

The [<name>](#) element is intended for generic applications and may be used to identify any named entity, such as a person, item, application, place, etc. Sometimes, however, a more specific encoding is desired, identifying the type of entity by using dedicated elements. MEI offers an (optional) module for this, which provides such elements for various types of names.

### 9.2.9 Dates

The [<date>](#) element may be used to mark up portions of a text that denote a date.

**<date>** A string identifying a point in time or the time period between two such points.

The element [<date>](#) contains a date in any format, including a date range. A date range may be expressed as textual content or, when intervening punctuation is present, as a combination of date sub-elements and text.

```
<p>
  <date>5/3/05</date>
  <date>May 30, 2012</date>
  <date>March 1–21, 1812</date>
  <date>
    <date>March 1, 1812</date>
    -
    <date>March 21, 1812</date>
  </date>
</p>
```

Listing 303.

---

To be more specific about the date, the attributes in the [att.datable](#) and [att.calendared](#) classes can be used:

- startdate ([att.datable](#)) Contains the starting point of a date range in standard ISO form.
- enddate ([att.datable](#)) Contains the end point of a date range in standard ISO form.
- notbefore ([att.datable](#)) Contains a lower boundary, in standard ISO form, for an uncertain date.
- notafter ([att.datable](#)) Contains an upper boundary for an uncertain date in standard ISO form.
- isodate ([att.datable](#)) Provides the value of a textual date in standard ISO form.

calendar            Indicates the calendar system to which a date belongs, for example, Gregorian, Julian, Roman,  
 (att.calendared)    Mosaic, Revolutionary, Islamic, etc.

In the following example, the ambiguous date text "5/3/05" is resolved using the isodate attribute:

```
<p>
  <date isodate="1905-05-03">5/3/05</date>
  <date isodate="2005-03-05">5/3/05</date>
</p>
```

Listing 304.

## 9.2.10 Numbers

The **<num>** element may be used to identify any numeric information in a text. The unit may be used to specify the unit of measurement.

**<num>** Numeric information in any form.

unit (att.measurement) Indicates the unit of measurement.

This element is useful when it is necessary to provide specific information about numeric data, such as the unit of measurement or the kind of quantity described, or when it should be displayed in a special manner.

## 9.2.11 Addresses

Addresses may be encoded using the **<address>** element, which itself may hold an arbitrary number of **<addrLine>** elements.

**<address>** Contains a postal address, for example of a publisher, an organization, or an individual.

**<addrLine>** Single line of a postal address.

It is important to note that the **<address>** element does not hold a reference to the person or organization whose address is specified. This must be provided in a separate element, as in the following example:

```
<p>
  <corpName>Universität Paderborn</corpName>
  <address>
    <addrLine>Warburger Straße 100</addrLine>
    <addrLine>33098 Paderborn</addrLine>
    <addrLine>Germany</addrLine>
  </address>
</p>
```

Listing 305.

## 9.2.12 Bibliographic Citations and References

The following element is used in the encoding of bibliographic citations and references:

**<bibl>** Provides a loosely-structured bibliographic citation in which the sub-components may or may not be explicitly marked.

The **<bibl>** element may contain a mix of text and more specific elements, including the following:

**<annot>** Provides a statement explaining the text or indicating the basis for an assertion.

**<arranger>** A person or organization who transcribes a musical composition, usually for a different medium from that of the original; in an arrangement the musical substance remains essentially unchanged.

**<author>** The name of the creator of the intellectual content of a non-musical, literary work.

**<biblScope>** Defines the scope of a bibliographic reference, for example as a list of page numbers, or a named subdivision of a larger work.

**<composer>** The name of the creator of the intellectual content of a musical work.

**<creation>** Non-bibliographic details of the creation of an intellectual entity, in narrative form, such as the date, place, and circumstances of its composition. More detailed information may be captured within the history element.

**<date>** A string identifying a point in time or the time period between two such points.

**<distributor>** Person or agency, other than a publisher, from which access (including electronic access) to a bibliographic entity may be obtained.

**<edition>** A word or text phrase that indicates a difference in either content or form between the item being described and a related item previously issued by the same publisher/distributor (e.g., 2nd edition, version 2.0, etc.), or simultaneously issued by either the same publisher/distributor or another publisher/distributor (e.g., large print edition, British edition, etc.).

**<editor>** The name of the individual(s), institution(s) or organization(s) acting in an editorial capacity.

**<extent>** Used to express size in terms other than physical dimensions, such as number of pages, records, bytes, physical components, etc.

**<funder>** Names of individuals, institutions, or organizations responsible for funding. Funders provide financial support for a project; they are distinct from sponsors, who provide intellectual support and authority.

**<genre>** Term or terms that designate a category characterizing a particular style, form, or content.

**<identifier>** An alpha-numeric string that establishes the identity of the described material.

**<imprint>** Information relating to the publication or distribution of a bibliographic item.

**<librettist>** Person or organization who is a writer of the text of an opera, oratorio, etc.

**<lyricist>** Person or organization who is a writer of the text of a song.

**<physLoc>** Groups information about the current physical location of a bibliographic item, such as the repository in which it is located and its shelf mark(s), and its previous locations.

**<publisher>** Name of the organization responsible for the publication of a bibliographic item.

- <pubPlace>** Name of the place where a bibliographic item was published.
- <recipient>** The name of the individual(s), institution(s) or organization(s) receiving correspondence.
- <relatedItem>** Contains or references another bibliographic item which is related to the present one.
- <repository>** Institution, agency, or individual which holds a bibliographic item.
- <respStmt>** Transcription of text that names one or more individuals, groups, or in rare cases, mechanical processes, responsible for creation, realization, production, funding, or distribution of the intellectual or artistic content.
- <series>** Contains information about the serial publication in which a bibliographic item has appeared.
- <sponsor>** Names of sponsoring individuals, organizations or institutions. Sponsors give their intellectual authority to a project; they are to be distinguished from funders, who provide the funding but do not necessarily take intellectual responsibility.
- <textLang>** Identifies the languages and writing systems within the work described by a bibliographic description, not the language of the description.
- <title>** Title of a bibliographic entity.

These elements fall into the following categories: - identification of the bibliographic entity and those responsible for its intellectual content - publication and distribution data for the bibliographic entity - description of the physical characteristics of the item - annotation of the bibliographic citation and additional details regarding the item's intellectual content

The elements **<title>**, **<edition>**, **<series>**, and **<identifier>** fall into the first category as do the elements **<arranger>**, **<author>**, **<composer>**, **<librettist>**, **<lyricist>**, **<funder>**, **<sponsor>**, and **<respStmt>**. The **<respStmt>** element is provided for marking responsibility roles that cannot be recorded using more specific elements. The **<biblScope>** element also carries information of an identifying nature.

The **<identifier>** for a given item may be an International Standard Book/Music Number, Library of Congress Control Number, a publisher's or plate number, a personal identification number, an entry in a bibliography or catalog, etc.

To classify the **<title>** according to some convenient typology, the type attribute may be used. Sample values include: main (main title), subordinate (subtitle, title of part), abbreviated (abbreviated form of title), alternative (alternate title by which the work is also known), translated (translated form of title), uniform (collective title). The type attribute is provided for convenience in analysing titles and processing them according to their type; where such specialized processing is not necessary, there is no need for such analysis, and the entire title, including subtitles and any parallel titles, may be enclosed within a single **<title>** element. Title parts may be encoded in **<title>** sub-elements. The name of the list from which a controlled value is taken may be recorded using the authority attribute.

Publication and distribution data may be captured using **<pubPlace>**, **<publisher>**, **<distributor>**, and **<date>** elements directly inside **<bibl>** when the citation is unstructured. However, these elements should be grouped within **<imprint>** whenever practical.

The physical characteristics of the cited item may be described using the **<extent>** element.

Annotation of the bibliographic citation and the provision of other pertinent details are addressed by several elements. Commentary on the bibliographic item or citation is accommodated by the `<annot>` and `<creation>` elements. The `<annot>` element is provided for generic comments, while `<creation>` is intended to hold information about the context of the creation of the cited item. Terms by which the bibliographic item can be classified may be placed in `<genre>`. For letters and other correspondence, `<recipient>` captures the name of the person or organization to whom the item was addressed. The natural language(s) of the item may be recorded in one or more `<textLang>` elements. Finally, a holding institution may be documented using the `<repository>` element directly within `<bibl>`, but `<physLoc>` should be used whenever possible as a grouping mechanism for location and shelfmark information. To identify sub-units of the holding institution, `<repository>` sub-elements may be used. The name of the list from which a controlled value for the agency name is taken may be recorded using the authority attribute.

When supplied with a target attribute, `<bibl>` may function as a hypertext reference to an external electronic resource. In addition, other related bibliographic items may be described or referenced using the `<relatedItem>` element.

---

```
<bibl>
  <genre>letter</genre>
  <author>Carl Nielsen</author>
  <recipient>Gustav Hetsch</recipient>
  <creation>
    <date isodate="1915-04-08">1915-04-08</date>
  </creation>
  <physLoc>
    <repository>
      <identifier auth.uri="http://www.rism.info/" auth="RISM">DK-Kk</identifier>
    </repository>
    <identifier>CNA IAc</identifier>
  </physLoc>
  <relatedItem rel="host">
    <bibl xml:id="shared.bibl_d1e380372">
      <title>CNB</title>
      <biblScope>V/210</biblScope>
    </bibl>
  </relatedItem>
</bibl>
```

---

Listing 306.

---

Please consult [9.2.8 Names](#) and [9.2.9 Dates](#) for more information about recording the names and dates frequently found in bibliographic citations.

### 9.2.12.1 Related Items

In some situations it is necessary to provide references from one bibliographic item to another. For these situations, MEI offers the `<relatedItem>` element. A `<relatedItem>` may be used inside of `<bibl>`, and may either point to a different entity using its target attribute, or may hold the related item as a child.

```

<bibl>
  <genre>letter</genre>
  <author>Carl Nielsen</author>
  <recipient>Gustav Hetsch</recipient>
  <creation>
    <date isodate="1915-04-08">1915-04-08</date>
  </creation>
  <physLoc>
    <repository>
      <identifier auth.uri="http://www.rism.info/" auth="RISM">DK-Kk</identifier>
    </repository>
    <identifier>CNA IAc</identifier>
  </physLoc>
  <relatedItem rel="host">
    <bibl xml:id="shared.bibl_d1e380372">
      <title>CNB</title>
      <biblScope>V/210</biblScope>
    </bibl>
  </relatedItem>
</bibl>

```

Listing 307.

In this example, the nested `<relatedItem>` / `<bibl>` provides information about the ‘container’ where the outer `<bibl>` may be found. The kind of relation is expressed using the `rel` attribute. It describes the relationship of the child `<bibl>` to the `<relatedItem>`’s parent `<bibl>`.

`rel` Describes the relationship between the entity identified by the `<relatedItem>` element and the (`<relatedItem>`) resource described in the parent element, i.e., `<bibl>`, `<source>` or `<relatedItem>`.

In these relations, the subject is always the `<relatedItem>`, and the object is always the parent of the `<relatedItem>`. Thus, a value of `rel="preceding"` indicates that the resource described within the `<relatedItem>` (or referenced by its target attribute) precedes the `<bibl>` containing the `<relatedItem>`. Following MODS, both values of preceding and succeeding indicate a temporal order.

It is important not to confuse `<relatedItem>` with the concepts of [3.5 Functional Requirements for Bibliographic Records \(FRBR\)](#); see [3.5.4 RelatedItem vs. FRBR](#).

### 9.2.13 Annotations

Annotations are one of the most versatile features of MEI. They are provided using the `<annot>` element.

**<annot>** Provides a statement explaining the text or indicating the basis for an assertion.

This element may be contained by a wide range of other elements and may contain a large number of other elements. While this offers great flexibility in addressing the wide variety of textual features that might occur within an annotation, it may lead to markup that cannot be effectively processed mechanistically.

In all cases, **<annot>** provides a comment upon a feature of the encoding, but never contains textual transcription. Depending on its context, an annotation will deal with either its parent element, or, more usually, with the element(s) specified in its plist attribute. This attribute uses URI references to link to one or more other elements using their xml:id attribute values, as in the following example:

---

```
<note xml:id="shared.someInterestingNote"/>
<!-- elsewhere in the document: -->
<annot plist="#shared.someInterestingNote">
  <!-- additional information about this note -->
</annot>
```

Listing 308.

---

# 10 Analysis Markup and Harmonies

This chapter of the MEI Guidelines describes how the results of a musical analysis or harmonic information may be stored in MEI.

## 10.1 Analytical Information

This chapter describes the use of attributes that capture data which may be useful for analytical purposes. The analysis module provides attributes that record relationships between entities found in the encoding. These attributes may be used differently by different users, depending on the purpose of the analysis.

These Guidelines recommend that encoders employ commonly accepted analytical practices, such as ‘functional analysis’ or ‘Schenkerian analysis’, and document their use in the [<encodingDesc>](#) described in section [3.4.2 Encoding Description](#). For general information on musical analysis, please consult Grove Music Online, ‘[Analysis](#)’.

### 10.1.1 General Relationships Between Elements

The relationships between event elements, such as note, chord, and rest, are the basic material of musical analysis; the attributes described below ensure a closed network of these relations and provide the opportunity to record data useful for common analytical tasks. In the context of a formal analysis, for instance, the attributes presented here can be useful in the capture information about the structure of a musical work.

MEI offers several attributes in the [att.linkng](#) class for the description of basic relationships:

copyof ( <a href="#">att.linkng</a> )	Points to an element of which the current element is a copy.
sameas ( <a href="#">att.linkng</a> )	Points to an element that is the same as the current element but is not a literal copy of the current element.
corresp ( <a href="#">att.linkng</a> )	Used to point to other elements that correspond to this one in a generic fashion.
next ( <a href="#">att.linkng</a> )	Used to point to the next event(s) in a user-defined collection.
prev ( <a href="#">att.linkng</a> )	Points to the previous event(s) in a user-defined collection.
precedes ( <a href="#">att.linkng</a> )	Points to one or more events in a user-defined collection that are known to be successors of the current element.
follows ( <a href="#">att.linkng</a> )	points to one or more events in a user-defined collection that are known to be predecessors of the current element.
synch ( <a href="#">att.linkng</a> )	Points to elements that are synchronous with the current element.

The [att.alignment](#) class also contains an attribute for describing temporal relationships:

when ( <a href="#">att.alignment</a> )	Indicates the point of occurrence of this feature along a time line. Its value must be the ID of a <a href="#">&lt;when&gt;</a> element elsewhere in the document.
-------------------------------------------	--------------------------------------------------------------------------------------------------------------------------------------------------------------------

These attributes accommodate the encoding of linkages between the element carrying the attribute and one or more other elements. All of them use URIs to establish the connection. While the examples below illustrate relationships between musical events, the use of the aforementioned attributes is not restricted to musical events. On the contrary, these attributes can be used to capture information about relations between any elements. Further information on this can be found in [13 Linking Data](#).

Using the attributes above makes it possible to create relationships between events, which are often widely-spaced in both encoded order and time. The attributes allow a large number of connections, enhancing the informational content, and therefore the potential usefulness, of the encoding.

The copyof attribute points to an element of which the current element is a copy. It can be used to repeat a note, for example, without encoding the whole `<note>` element again. The copy is a ‘deep’ one; that is, the copyof attribute copies all attributes and child elements which belong to the copied element, such as the dur and oct attributes of a copied `<note>`. The value of the copyof attribute must be a URI, which usually refers to an element in the current document. The following example demonstrates use of the copyof attribute:

---

```
<section>
  <measure n="1">
    <staff n="1">
      <layer>
        <note xml:id="analysis.note1_1" dur="4" oct="4" pname="g"/>
      </layer>
    </staff>
  </measure>
  <measure n="2">
    <staff n="1">
      <layer>
        <note copyof="#analysis.note1_1"/>
      </layer>
    </staff>
  </measure>
</section>
```

---

Listing 309.

---

In this example, the `<note>` in the second measure has exactly the same characteristics as the `<note>` in the first `<measure>`.

Using copyof is not limited to copying events. The copyof attribute can also be used to copy an entire `<measure>` or `<staff>`. When there are many repeated features, the use of the copyof greatly reduces encoding effort. The image and the following encoding of the beginning of Schubert’s *Erlkönig* illustrates the benefit of using the copyof attribute.

Figure 112. First measure of Schubert's Erlkönig

```

<measure>
  <staff n="1">
    <layer>
      <tuplet num="3" num.visible="true" xml:id="analysis.tup1">
        <chord dur="8">
          <note oct="3" pname="g"/>
          <note oct="4" pname="g"/>
        </chord>
        <chord dur="8">
          <note oct="3" pname="g"/>
          <note oct="4" pname="g"/>
        </chord>
        <chord dur="8">
          <note oct="3" pname="g"/>
          <note oct="4" pname="g"/>
        </chord>
      </tuplet>
      <tuplet copyof="#analysis.tup1" xml:id="analysis.tup2"/>
      <tuplet copyof="#analysis.tup1" xml:id="analysis.tup3"/>
      <tuplet copyof="#analysis.tup1" xml:id="analysis.tup4"/>
    </layer>
  </staff>
</measure>

```

Listing 310.

This example can be reduced further by using copyof inside the initial tuplet to represent the repeated chords:

```

<measure>
  <staff n="1">
    <layer>

```

```
<mRest/>
</layer>
</staff>
<staff n="2">
<layer>
<tuplet num="3" num.visible="true" xml:id="analysis.tup5">
<chord dur="8" xml:id="analysis.t1c1">
<note oct="3" pname="g"/>
<note oct="4" pname="g"/>
</chord>
<chord copyof="#analysis.t1c1"/>
<chord copyof="#analysis.t1c1"/>
</tuplet>
<tuplet copyof="#analysis.tup5" xml:id="analysis.tup6"/>
<tuplet copyof="#analysis.tup5" xml:id="analysis.tup7"/>
<tuplet copyof="#analysis.tup5" xml:id="analysis.tup8"/>
</layer>
</staff>
<staff n="3">
<layer>
<mRest/>
</layer>
</staff>
</measure>
```

---

Listing 311.

While copyof signifies a duplicate copy of an element, the sameas indicates that the current element represents exactly the same entity as the one referenced in sameas. Use of sameas is used for describing the same entity from multiple perspectives, e.g., the same event in two layers.

While copyof and sameas have defined semantics, the corresp may be used to create user-defined relationships between elements. The example below demonstrates the encoding of a relationship between the third note and the fermata, even though the fermata is not placed directly above the note.

---

```
<measure n="1" right="end">
<staff n="1">
<layer n="1">
<note dur="4" oct="4" pname="c" xml:id="analysis.note1"/>
<note dur="4" oct="4" pname="d" xml:id="analysis.note2"/>
<note dur="2" oct="4" pname="e" xml:id="analysis.note3"/>
</layer>
</staff>
<fermata corresp="#analysis.note3" place="above" tstamp="4.75"/>
</measure>
```

---

Listing 312.

The corresp attribute only marks the correspondence between the current element and one or more other entities. To describe the nature of the correspondence, one must use `<annot>`.

The next and prev attributes point to elements which follow or precede the current element in some fashion other than that indicated by encoding order. The use of these attributes helps to avoid confusion in the sequence of events, for example, in voice leading across layers or staves, when the encoding reflects the physical arrangement of voices. In the second measure of the following example, the target of the next attribute occurs after the pointing element in time, but before it in encoding order:

Figure 113. Bach Chorale, Ach Gott, vom Himmel sieh' darein, m. 6-7

```

<measure n="6" xml:id="analysis.m_sc_62">
  <staff n="1">

            </beam>
            <note dur="4" oct="4" pname="e" xml:id="analysis.n_sc_73_1"/>
            <note dur="4" oct="4" pname="e" xml:id="analysis.n_sc_75_1"/>
            <beam>
                <note dur="8" oct="4" pname="e" xml:id="analysis.n_sc_76_1"/>
            </beam>
        </layer>
    </staff>
</measure>

```

```

        <note dur="8" oct="4" pname="d" xml:id="analysis.n_sc_77_1"/>
    </beam>
</layer>
</staff>
<staff n="2">
    <layer n="1">
        <note dur="4" next="#analysis.n_sc_73_2" oct="3" pname="a" xml:id="analysis.n_sc_71_2"/>
    </layer>
    <layer n="2">
        <note accid="n" dur="4" oct="3" pname="f" xml:id="n_sc_71_0"/>
        <beam>
            <note dur="8" oct="3" pname="c" xml:id="n_sc_73_0"/>
            <note dur="8" oct="3" pname="d" xml:id="n_sc_74_0"/>
        </beam>
        <note dur="4" oct="3" pname="e" xml:id="n_sc_75_0"/>
        <beam>
            <note dur="8" oct="2" pname="a" xml:id="n_sc_76_0"/>
            <note dur="8" oct="2" pname="b" xml:id="n_sc_77_0"/>
        </beam>
    </layer>
</staff>
</measure>

```

Listing 313.

This attribute may also be useful to clarify a sequence of entities which occurs across some form of interruption, in this case, notes before and after a system or page break where there is no custos or direct in the source:

```

<measure n="1">
    <staff n="1">
        <layer>
            <note dur="4" next="#analysis.m1s1e2" oct="4" pname="f" stem.dir="up"
                xml:id="analysis.m1s1e1"/>
            <pb/>
            <note dur="8" next="#analysis.m1s1e3" oct="3" pname="b" prev="#analysis.m1s1e1"
                stem.dir="up" xml:id="analysis.m1s1e2"/>
            <note dur="8" oct="4" pname="c" prev="#analysis.m1s1e2" stem.dir="up"
                xml:id="analysis.m1s1e3"/>
        </layer>
    </staff>
</measure>

```

Listing 314.

A one-to-many relationship between the current element and the entities being referred to can be expressed by using a list of space-separated URIs in corresp.

The synch attribute points to an element that is synchronous with; that is, begins at the same moment in time, as the current element. It is useful when the encoding order differs from the order in which entities occur in time.

The when attribute may be used to indicate the point of occurrence of the feature bearing this attribute along a time line. Its value must be the ID of a [when](#) element. For more detailed information regarding the use of when, please see [12.2 Performances](#).

### 10.1.2 Event-Specific Analytical Information

In addition to the common analytical attributes, the analysis module also offers other, more specific attributes on certain musical elements:

inth ([att.intervalHarmonic](#)) Encodes the harmonic interval between pitches occurring at the same time.

intm ([att.intervalMelodic](#)) Encodes the melodic interval from the previous pitch. The value may be a general directional indication (u, d, s, etc.), an indication of diatonic interval direction, quality, and size, or a precise numeric value in half steps.

mfunc ([att.melodicFunction](#)) Describes melodic function using [Humdrum \\*\\*embel syntax](#).

deg ([att.harmonicFunction](#)) Captures scale degree information using [Humdrum \\*\\*deg syntax](#) -- an optional indicator of melodic approach (^ = ascending approach, v = descending approach), a scale degree value (1 = tonic ... 7 = leading tone), and an optional indication of chromatic alteration, 1, v7, ^1, or v5+, for example. The amount of chromatic alteration is not indicated.

pclass ([att.pitchClass](#)) Holds pitch class information.

psolfa ([att.solfa](#)) Contains sol-fa designation, e.g., do, re, mi, etc., in either a fixed or movable Do system.

#### 10.1.2.1 Melodic Intervals

The intm attribute offers several methods for encoding the melodic interval from a preceding pitch. First, Parsons Code allows for description of the contour of the melody in very general terms; that is, as up, down, or same note. Parsons Code is helpful for identifying musical works with clearly defined melodies and analyzing the relationship between successive notes of monophonic tunes. For more information about the Parsons Code, please see the "The Directory of Tunes and Musical Themes" by Denys Parsons (2002). The next example shows interval relationships indicated by the Parsons Code:

```
<measure n="1">
  <staff n="1">
    <layer>
      <note dur="4" oct="4" pname="c"/>
      <note dur="4" oct="4" pname="d" intm="u"/>
      <note dur="4" oct="4" pname="e" intm="u"/>
```

```

<note dur="4" oct="4" pname="f" intm="u"/>
<note dur="2" oct="4" pname="g" intm="u"/>
<note dur="2" oct="4" pname="g" intm="s"/>
<note dur="4" oct="4" pname="f" intm="d"/>
</layer>
</staff>
</measure>

```

Listing 315.

Alternatively, diatonic interval quality and size may be indicated by a letter signifying the interval quality (A= augmented, d= diminished, M = major, m = minor, P = perfect) followed by a number indicating the size of the interval. The interval direction may be encoded using a leading plus (+) or minus (-) sign:

```

<measure>
<staff>
<layer>
<note dur="4" oct="5" pname="c"/>
<note dur="4" oct="5" pname="d" intm="+M2"/>
<note dur="4" oct="5" pname="c" intm="-M2"/>
<note dur="4" oct="4" pname="b" intm="-m2"/>
<note dur="4" oct="3" pname="b" intm="-P8"/>
</layer>
</staff>
</measure>

```

Listing 316.

As a third option, signed integers may be used to record the difference in half steps between the previous pitch and the current one. Decimal values accommodate the description of microtonal intervals:

```

<measure>
<staff>
<layer>
<note dur="4" oct="4" pname="c"/>
<note dur="4" oct="4" pname="d" intm="1.1"/>
<note dur="4" oct="5" pname="d" intm="7.9"/>
<note dur="4" oct="5" pname="c" intm="-2.334"/>
</layer>
</staff>
</measure>

```

Listing 317.

### 10.1.2.2 Melodic Function

The mfunc attribute describes melodic function of a `<note>` or neume using the [Humdrum \\*\\*embel syntax](#). In the following example, the note B is labeled as a lower neighbor while all other notes are labeled as chord tones:

```

<section>
  <measure n="2">
    <staff n="1">
      <layer>
        <chord dur="4" stem.dir="up" xml:id="analysis.chord1">
          <note dur="4" mfunc="ct" oct="4" pname="f" xml:id="analysis.m2e1"/>
          <note dur="4" mfunc="ct" oct="4" pname="a" xml:id="analysis.m2e2"/>
          <note dur="4" mfunc="ct" oct="5" pname="c" xml:id="analysis.m2e3"/>
        </chord>
        <note accid="f" dur="4" mfunc="ln" oct="4" pname="b" stem.dir="down"
          xml:id="analysis.m2e4"/>
      </layer>
    </staff>
  </measure>
  <measure n="3">
    <staff n="1">
      <layer>
        <chord dur="4" stem.dir="up" xml:id="analysis.chord2">
          <note dur="4" mfunc="ct" oct="4" pname="c" xml:id="analysis.m3e5"/>
          <note dur="4" mfunc="ct" oct="4" pname="e" xml:id="analysis.m3e6"/>
          <note dur="4" mfunc="ct" oct="4" pname="g" xml:id="analysis.m3e7"/>
        </chord>
      </layer>
    </staff>
  </measure>
</section>

```

Listing 318.

### 10.1.2.3 Harmonic Intervals

inth ([att.intervalHarmonic](#)) Encodes the harmonic interval between pitches occurring at the same time.

In contrast with intm, which characterizes melodic (sequential) intervals, the inth attribute is used to encode the harmonic interval between the current note and other pitches occurring at the same moment in time. The notes of interest may or may not be marked as a `<chord>`. In the markup below, for example, the values of inth capture the harmonic intervals between notes distributed across multiple staves and layers.

```

<measure>

```

```

<staff>
  <layer n="1">
    <note dur="4" inth="M3 P5" oct="4" pname="c" xml:id="analysis.e1"/>
  </layer>
  <layer n="2">
    <note dur="4" inth="M3 m3" oct="4" pname="e" xml:id="analysis.e2"/>
  </layer>
</staff>
<staff n="2">
  <layer n="3">
    <note dur="4" inth="P5 m3" oct="4" pname="g" xml:id="analysis.e3"/>
  </layer>
</staff>
</measure>

```

Listing 319.

Use of the inth permits detailed specification of intervallic information for every note and its function in relation to other simultaneously-occurring notes and hence about the harmonic nature of the musical work.

#### 10.1.2.4 Scale Degrees

**deg** ([att.harmonicFunction](#)) Captures scale degree information using [Humdrum \\*\\*deg syntax](#) -- an optional indicator of melodic approach (^ = ascending approach, v = descending approach), a scale degree value (1 = tonic ... 7 = leading tone), and an optional indication of chromatic alteration, 1, v7, ^1, or v5+, for example. The amount of chromatic alteration is not indicated.

The deg attribute can be used to represent key-dependent scale-degree information for music in major or minor keys.

Scale-degree values are relative to the prevailing major or minor key. In the case of minor keys, scale degrees are characterized with respect to the harmonic minor scale. For example, the pitch F in the key of A minor is the submediant (6), but F is the lowered submediant (6-) in the key of A major.

Melodic approach can be indicated by a leading caret (^) or lowercase v, representing ascending and descending approaches, respectively.

Chromatic alteration of the scale degree can be represented using a trailing plus (+) or minus (-) signs, signifying raised or lowered scale degree, respectively. The actual amount of chromatic alteration is not indicated.

```

<!-- Fifth scale degree in the prevailing scale -->
<note deg="5"/>

```

Listing 320.

```
<!-- Augmented 5th -->
<note deg="5+" />
```

Listing 321.

---

```
<!-- Lowered 6 scale degree approached from below -->
<note deg="^6-" />
```

Listing 322.

---

```
<!-- Leading tone approached from above -->
<note deg="v7" />
```

Listing 323.

---

#### 10.1.2.5 Pitch Class

The pclass attribute can be used to encode information about the pitch class to which a note belongs. The attribute's value must be an integer less than or equal to 11. It is only allowed on the `<note>` element. The pclass attribute comes from "musical set theory" elaborated first by Howard Hanson and Allen Forte as a new method for organizing tones. It provides a concept for categorizing musical objects (notes) and describing their relationships. It is a kind of grouping and combining, mostly developed in connection with atonal music. However, the concept of set theory is general and can also be applied to tonal music. A pitch class means the summary of every pitch with specific characteristics that means a pitch class set is an unordered collection of pitches, e.g., every pitch with the name C.

A pitch class may contain a large number of pitches, because different octaves and enharmonic spellings of pitch make no difference. The notes C, E, and G would be 0, 4 and 7 in pitch class notation, for example, regardless of the octave in which they are performed. The example below contains the same pitch in four different enharmonic spellings, but all are part of the same pitch class.

---

```
<chord>
  <note dur="2" oct="5" pclass="2" pname="d"/>
  <note accid="ss" dur="4" pclass="2" pname="c"/>
  <note accid="ff" dur="1" pclass="2" pname="e"/>
</chord>
```

Listing 324.

### 10.1.2.6 Solmization

Solmization is a system which associates a syllable with each note of a musical scale. There are various forms of solmization used throughout the world. In Europe and North America, solfège is the most common practice. In this system, the seven syllables for a major scale are do, re, mi, fa, so, la and ti. In the 'fixed-do' system, the syllable "do" is always associated with the pitch "c", while in the 'movable-do' system, "do" is associated with the tonic note. The psolfa attribute is only allowed on `<note>` and `<nc>` elements. Its value is unconstrained in order to accommodate various solmization systems.

```
<measure>
  <staff n="1">
    <layer>
      <note dur="4" oct="4" pname="c" psolfa="do"/>
      <note dur="4" oct="4" pname="d" psolfa="re"/>
      <note dur="4" oct="4" pname="e" psolfa="mi"/>
      <note dur="4" oct="4" pname="f" psolfa="fa"/>
    </layer>
  </staff>
</measure>
```

Listing 325.

### 10.1.3 Metrical Conformance

It is often helpful to record whether a given staff, layer, or measure obeys the meter established for it. The following attributes are provided for this purpose:

metcon (att.meterConformance)	Indicates the relationship between the content of a staff or layer and the prevailing meter.
----------------------------------	----------------------------------------------------------------------------------------------

metcon (att.meterConformance.bar)	Indicates the relationship between the content of a measure and the prevailing meter.
--------------------------------------	---------------------------------------------------------------------------------------

When used on `<staff>` or `<layer>` elements, the metcon attribute can be used to indicate if the duration of the contained events is equal to (c), less than (i), or greater than (o) that predicted by the time signature. When used on the `<measure>` element, metcon takes a boolean value, where true indicates conformance by all staff and layer descendants of the measure.

In the first example below, the layer, staff, and measure all match the prevailing meter. In the second example, however, the first layer does not comply with the meter, making the staff containing it and measure as a whole non-compliant. When there is a single layer or when all the layers on a staff agree with each other, metrical compliance can be indicated on the `<staff>` element. When, however, not all layers have the same value for metcon, then it is necessary to omit metcon at the staff level. The value of metcon on the measure level can usually be computed based on the values of its layer and staff sub-elements.

---

```
<!-- in 2/4 -->
<measure metcon="true" n="1">
  <staff n="1">
    <layer>
      <note dur="4" oct="4" pname="f"/>
      <note dur="8" oct="4" pname="b"/>
      <note dur="8" oct="4" pname="a"/>
    </layer>
  </staff>
</measure>
```

---

Listing 326.

---

```
<!-- in 2/4 -->
<measure metcon="false" n="1">
  <staff n="1">
    <layer metcon="i">
      <note dur="4" oct="4" pname="f"/>
      <note dur="8" oct="4" pname="b"/>
    </layer>
    <layer metcon="true">
      <note dur="4" oct="4" pname="d"/>
      <note dur="8" oct="4" pname="g"/>
      <note dur="8" oct="4" pname="f"/>
    </layer>
  </staff>
</measure>
```

---

Listing 327.

---

## 10.2 Harmony

This chapter describes the encoding of indications of harmony occurring within a music text, e.g., chord names, tablature grids, figured bass, or signs for harmonic analysis, and the methods by which these indications can be connected with their interpretations. For encoder-supplied analysis of intervallic content, please see chapter [10.1 Analytical Information](#).

### 10.2.1 Indications of Harmony

On the most basic level, chords in the musical text can be encoded using the `<chord>` element:

**<chord>** A simultaneous sounding of two or more notes in the same layer \*with the same duration\*.

Additional information on the use of the `<chord>` element is available in [2.2.3 Basic Music Events](#) and [4.2.5 Notes, Chords and Rests in CMN](#).

With only this kind of markup, harmonic information is implicit in the notes themselves. The elements and attributes of this module, however, provide for the encoding of explicit indications of harmony, such as chord symbols, tablature grids, figured bass signs, and the symbols of harmonic analysis like Roman numerals and their interpretation.

#### 10.2.1.1 Interpreted Chord Data in scoreDef

An harmonic label, such as "7", may occur many times throughout an MEI instance. Where the goal is diplomatic transcription, simply recording the uninterpreted label is sufficient. Recording the precise meaning of such a label requires storing an interpretation. But, including the interpretation at every point of occurrence of the label would swell the size of the file and complicate the markup for those users who are not interested in the interpretation. Therefore, MEI separates the encoding of harmonic labels from the encoding of the interpretation of those labels.

The following elements enable the creation and re-use of interpreted chord data:

**<chordTable>** Chord/tablature look-up table.

**<chordDef>** Chord tablature definition.

`tab.pos (att.stringtab.position)` Records fret position.

**<chordMember>** An individual pitch in a chord defined by a `<chordDef>` element.

`inth (att.intervalHarmonic)` Encodes the harmonic interval between pitches occurring at the same time.

`tab.fing (att.stringtab)` Indicates which finger, if any, should be used to play an individual string. The index, middle, ring and little fingers are represented by the values 1-4, while t is for the thumb. The values x and o indicate muffled and open strings, respectively.

`tab.fret (att.stringtab)` Records the location at which a string should be stopped against a fret.

**<barre>** A barre in a chord tablature grid.

fret      Records the location at which the strings should be stopped against a fret in a fretboard diagram. This **<barre>** may or may not be the same as the actual location on the fretboard of the instrument in performance.

The **<chordTable>** element is a container for a set of chord definitions, while the **<chordDef>** element defines a single chord. Chord definitions may be created *a priori* or as the result of analysis of the pitch content of the music at hand, for instance, by examination of the notes occurring on the downbeat of each measure. In this way, the chord definitions serve as a record of the analysis.

Even though it is not required by the schema, an `xml:id` attribute on **<chordDef>** is necessary to permit the creation of associations between harmonic indications in the musical text with the chord defined here. The `xml:id` attribute provides a unique identifier for the chord definition that can be referenced by the **<harm>** element's `chordref` attribute.

Individual pitches of a chord are encoded using **<chordMember>**. The `inth` attribute provides the means for indicating the number of half steps of the chord note above the bass note.

These simple resources allow for the detailed specification and interpretation of harmonic indications found in the musical text. For example, the harmonic label A can be equated with a fully spelled-out indication of functional harmony that can be substituted for the harmonic label, say, in an aural rendition:

```
<!-- Chord defined in scoreDef -->
<chordDef xml:id="harmonychordA">
  <chordMember oct="2" pname="a"/>
  <chordMember oct="3" pname="e"/>
  <chordMember accid.ges="s" oct="4" pname="c"/>
  <chordMember oct="4" pname="e"/>
  <chordMember oct="4" pname="a"/>
</chordDef>
<!-- Later in musical text -->
<harm chordref="#harmonychordA" tstamp="1">A</harm>
```

---

Listing 328.

---

Alternatively, the non-bass chord tones may be indicated, not with pitch names, but with their intervallic distance above the bass note. Therefore, the example above may also be encoded:

```
<chordDef xml:id="harmonychordA2">
  <chordMember oct="2" pname="a"/>
  <chordMember intn="7"/>
  <chordMember intn="16"/>
  <chordMember intn="19"/>
  <chordMember intn="24"/>
```

---

```
</chordDef>
```

Listing 329.

---

The preceding encoding possibilities provide the detailed information necessary to create playable chord annotations. For more generic uses, however, the encoding can be taken one step further; that is, it can be reduced to its minimum intervallic content by eliminating octave duplications and expressing all chord members, including the bass note, using intervals above the bass. Of course, the `inth` attribute for the bass note itself should be set to 0. For example:

```
<chordDef xml:id="harmonychordA3">
  <chordMember inth="0"/>
  <chordMember inth="4"/>
  <chordMember inth="7"/>
</chordDef>
```

Listing 330.

---

### 10.2.1.2 Chord Tablature Grids

The `pos` attribute on `<chordDef>`, the `fing` and `fret` attributes on `<chordMember>`, and the `<barre>` element child of `<chordDef>` are provided in order to create displayable and performable chord tablature grids for guitar and other fretted string instruments. The `fret` attribute gives the fret position at which the barre should be created, while the `startid` and `endid` attributes are used to indicate the `<chordMember>` elements on which the barre starts and finishes.

The `<chordDef>` element may contain `<barre>` sub-elements when a single finger is used to stop multiple strings. Here the `fret` attribute gives the fret position at which the barre should be created, while the `startid` and `endid` attributes are used to indicate the `<chordMember>` elements on which the barre starts and finishes.

### 10.2.1.3 Indications of Harmony in the Music Text

With regard to indications of harmony, MEI attempts to strike a balance between very precise (interpreted) and very loose (uninterpreted) markup needs. Therefore, various kinds of harmonic labels are accommodated by the `<harm>` element. While some are more structured than others, in the final analysis they all function as *labels*. Therefore, MEI provides only a single element for the capture of harmonic indications of all kinds:

extender (`att.extender`) Indicates the presence of an extension symbol, typically a line.

rendgrid (`att.harm.vis`) Describes how the harmonic indication should be rendered.

The `<harm>` element can be used to capture chord labels that consist entirely of text:

```
<measure>
  <harm tstamp="1">Cmaj</harm>
  <harm tstamp="2">ii6</harm>
</measure>
```

Listing 331.

or labels that are chord tablature grids:

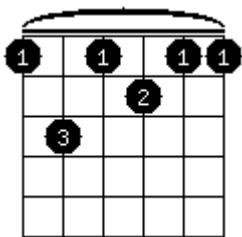

Figure 114. Chord grid without label

```
<harm chordref="#harmonychordA" tstamp="1"/>
```

Listing 332.

or labels that mix these styles:

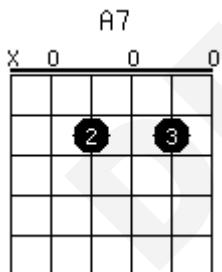

Figure 115. Chord grid with label

```
<harm chordref="#harmonychordA" rendgrid="gridtext" tstamp="1">A7</harm>
```

Listing 333.

The `<harm>` element must define a point of attachment using one of the following attributes: startid, tstamp, tstamp.ges or tstamp.real. The most commonly-used of these are startid and tstamp.

The dur attribute encodes the logical and visual duration of the harmony. Please note that the dur attribute here is not a true duration, but rather a time stamp for the end point of the harmony.

Precise placement of the harmonic label can be controlled through the use of attributes in the `att.harm.vis` attribute class.

### 10.2.1.3.1 Figured Bass

Figured bass is a specialized form of harmonic indication. In order to support the capture of the semantics of figured bass, and not just its visual representation, MEI provides the following elements:

**<fb>** Symbols added to a bass line that indicate harmony. Used to improvise a chordal accompaniment. Sometimes called Generalbass, thoroughbass, or basso continuo.

extender (`att.extender`) Indicates the presence of an extension symbol, typically a line.

Figured bass, consisting as it does of text, can always be represented purely visually. This is probably how an OMR program or other naive encoder might deal with the markup of figured bass:

Figure 116. Figured bass

```
<harm place="above" staff="1" tstamp="1">6</harm>
```

Listing 334.

However, this kind of approach fails to recognize that a figured bass is being used and not some other system of harmonic indications. To capture this knowledge, the preceding example can also be marked more explicitly with:

```
<harm place="above" staff="1" tstamp="1">
  <fb>
    <f>6</f>
```

```
</fb>
</harm>
```

Listing 335.

In order to provide greater control over the individual components of the figured bass, each component can be treated as a figure. The natural symbol is encoded using the Unicode MUSIC NATURAL SIGN character.

---

Figure 117. Figured bass with accidental

```
<harm place="above" staff="1" tstamp="1">
<fb>
  <f>7</f>
  <f>♮</f>
</fb>
</harm>
```

Listing 336.

Encoding order of the component `<f>` elements is significant as is the encoding order of the characters within each component. In the preceding example, the entire figured bass sign is encoded from top to bottom, in other words, just as the figure appears on the page. In the following examples, the encoding order of the characters in `<f>` explicitly locates the accidentals:

---

Figure 118. Figured bass with chromatically altered figure

```
<harm place="below">
<fb>
<f>7 b</f>
</fb>
</harm>
```

Listing 337.

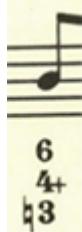

Figure 119. Figured bass with chromatically altered figures

```
<harm>
<fb>
<f>6</f>
<f>4+</f>
<f>⁹ 3</f>
</fb>
</harm>
```

Listing 338.

You may use 6\ and 6/ for numerals that should be shown with a backslash and slash, respectively. An alternative would be to use the "bslash" (backward slash) and "fslash" (forward slash) on the `<rend>` element.

Figure 120. Figured bass with chromatically altered figure

```
<harm>
```

```

<fb>
  <f>
    <rend rend="bslash">6</rend>
  </f>
  <!-- or -->
  <f>
    <rend rend="fslash">6</rend>
  </f>
</fb>
</harm>

```

Listing 339.

Each component of the figured bass sign may use the extender attribute to indicate that horizontal lines are used to mark the extent of the figure's harmonic influence. The altsym attribute can be used to point to a user-defined symbol that better represents the figure component, for example, the combined "2" and "+" below. Similar to the slash in the preceding example before, the small curve over the "5" in example 6 can be represented by the Unicode COMBINING INVERTED BREVE.

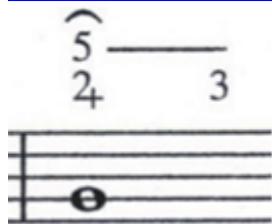

Figure 121. Figured bass with alternative sign

```

<measure>
  <harm tstamp="1">
    <fb>
      <f>2</f>
      <f extender="true">5</f>
      <f altsym="combo2plus">2+</f>
    </fb>
  </harm>
  <harm tstamp="3">
    <fb>
      <f>3</f>
    </fb>
  </harm>
</measure>

```

Listing 340.

Because the repertoire of signs is so large, figures which consist entirely of a mark indicating repetition of the preceding figure, should be represented by the character appearing in the document. For example, in some notational styles, the repetition sign is a dash (-), while in others it is a solidus (/). Using characters like this is also consistent with other existing figured bass encoding schemes.

Figure 122. Figured bass repetition

```
<harm tstamp="1.5">
  <fb>
    <f>-</f>
  </fb>
</harm>
```

Listing 341.

Often, the distinction between extending lines and repetition signs is unclear. Treating what at first appear to be extenders as repetition signs, however, can sometimes help to simplify the required markup and to make the intent of the signs explicit. For example, in the following example the dashes on beat 4 and 4.5 are treated as repetition signs:

Figure 123. Extenders and repetition

```
<measure>
  <harm tstamp="3.5">
    <fb>
      <f>b3</f>
      <f>6</f>
      <f>5</f>
```

```
</fb>
</harm>
<harm tstamp="4">
  <fb>
    <f>-</f>
    <f>#3</f>
  </fb>
</harm>
<harm tstamp="4.5">
  <fb>
    <f>7</f>
    <f>-</f>
  </fb>
</harm>
</measure>
```

---

Listing 342.

Using extender attributes for this example may make it easier to render the figured bass symbol, but it is less explicit with regard to the intended harmony. For example, it is difficult to ascertain what harmony should be sounding on beat 4 and its after-beat.

---

```
<measure>
  <harm tstamp="3.5">
    <fb>
      <f>b 3</f>
      <f extender="true">6</f>
      <f>5</f>
    </fb>
  </harm>
  <harm tstamp="4">
    <fb>
      <f extender="true">#3</f>
    </fb>
  </harm>
  <harm tstamp="4.5">
    <fb>
      <f>7</f>
    </fb>
  </harm>
</measure>
```

---

Listing 343.

The primary goal of `<fb>` is not the capture all the visual idiosyncrasies that can be found in printed and manuscript scores throughout the centuries, but to provide a more-or-less standardized label. The markup below, or any markup in fact, cannot capture the exact look of the figured bass signs. The `altsym` attribute may be used to provide access to a user-defined symbol for precise rendition. Similarly, the `facs` attribute may be employed to point to the symbol as it occurs in the encoding source material.

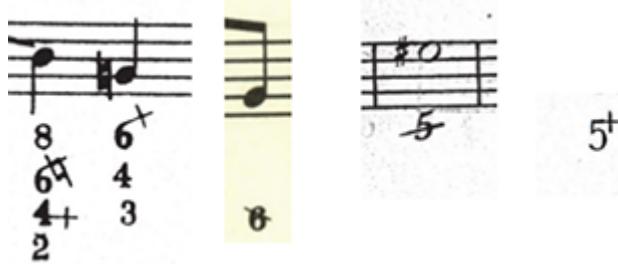

Figure 124. Figured bass with alternative sign

```
<!-- Ex. a -->
<measure>
  <harm tstamp="3">
    <fb>
      <f>8</f>
      <f altsym="#my6_1" facs="#source6_1">6½</f>
      <f>4+</f>
      <f>2</f>
    </fb>
  </harm>
  <harm tstamp="4">
    <fb>
      <f altsym="#my6_2" facs="#source6_2">6\</f>
      <f>4</f>
      <f>3</f>
    </fb>
  </harm>
</measure>
```

Listing 344.

```
<!-- Ex. b -->
<harm tstamp="4.5">
  <fb>
    <f>6\</f>
  </fb>
</harm>
```

Listing 345.

```
<!-- Ex. c -->
<harm tstamp="1">
  <fb>
    <f>5/</f>
  </fb>
</harm>
```

Listing 346.

---

```
<!-- Ex. d -->
<harm>
  <fb>
    <f altsym="#my5" facs="#source5">5+</f>
  </fb>
</harm>
```

Listing 347.

---

# 11 Scholarly Editing with MEI

This chapter introduces markup targeting at digital scholarly editions of music. In [11.1 Critical Apparatus](#), the alignment of multiple sources / witnesses of the same musical text is discussed. [11.2 Editorial Markup](#) covers editorial observations in and interventions to the text. [11.3 Genetic Markup](#) finally deals with the special requirements and needs of genetic editions in music.

## 11.1 Critical Apparatus

This chapter describes how to encode differences between multiple exemplars of the same musical work (often referred to in MEI as 'sources'). The mechanisms and elements described in this chapter are closely related to their counterparts in the TEI guidelines. It is also important to refer to chapter [11.2 Editorial Markup](#) of these guidelines, especially concerning the `<choice>` element described therein.

### 11.1.1 General Usage

The following elements are defined in the critApp Module:

- `<app>` (apparatus) – Contains one or more alternative encodings.
- `<lem>` (lemma) – Contains the lemma, or base text, of a textual variation.
- `<rdg>` (reading) – Contains a single reading within a textual variation.

An `<app>` element always encapsulates the differences between varying sources. Therefore, it must contain at least two child elements. Possible child elements are `<lem>` and `<rdg>`, which use the same model, but have a different meaning: Whereas `<lem>` is used for prioritizing one alternative, a `<rdg>` has no such additional meaning and simply indicates a reading as found in one or more sources. Accordingly, `<lem>` is allowed only once in `<app>`, whereas `<rdg>` may appear as often as necessary.

```
<app>
  <lem>
    <!-- preferred reading -->
  </lem>
  <rdg>
    <!-- alternative reading -->
  </rdg>
  <rdg>
    <!-- alternative reading -->
  </rdg>
</app>
```

Listing 348.

The `<rdg>` (and `<lem>`) elements use the source attribute to point to one or more descriptions of the bibliographic sources containing the material they mark:

```
<!-- In the document content: -->
<app>
  <rdg source="#critApp.source1">
    <!-- reading of source 1 -->
  </rdg>
  <rdg source="#critApp.source2 #critApp.source3">
    <!-- reading of sources 2 *and* 3 -->
  </rdg>
</app>
```

Listing 349.

```
<!-- Earlier in the document header: -->
<sourceDesc>
  <source xml:id="critApp.source1">
    <!-- bibliographic description of source 1 -->
  </source>
  <source xml:id="critApp.source2">
    <!-- bibliographic description of source 2 -->
  </source>
  <source xml:id="critApp.source3">
    <!-- bibliographic description of source 3 -->
  </source>
</sourceDesc>
```

Listing 350.

The seq attribute may be used on [<lem>](#) or [<rdg>](#) to record the sequence of a series of readings. In the following example, the material in source B is marked as sequential to (and perhaps derived from) the reading in source A:

```
<app>
  <rdg seq="1" source="#critApp.sourceA">
    <!-- material in source 1 -->
  </rdg>
  <rdg seq="2" source="#critApp.sourceB">
    <!-- material in source 2 -->
  </rdg>
</app>
```

Listing 351.

If interested in modeling such dependencies between witnesses, using markup from [3.5 Functional Requirements for Bibliographic Records \(FRBR\)](#) is generally recommendable.

If a source has additional content that is not found in other sources, an empty `<rdg>` element may be used to indicate the lack of material in the other sources. In the following example, source 1 includes material that is not found in sources 2 and 3:

```
<app>
<rdg source="#critApp.source1">
    <!-- additional content of source 1 -->
</rdg>
<rdg source="#critApp.source2 #critApp.source3"/>
</app>
```

Listing 352.

When working with a large number of sources, it might seem tedious to provide references for all sources. However, use of the `<rdg>` element without source is not recommended because such an encoding is not explicit and is therefore difficult to process.

### 11.1.2 Variants in Musical Content

The `<app>` element may be used to accommodate textual variation at nearly any point in a musical text. For example, it may be used to indicate minor differences such as stem directions:

```
<layer>
<!-- preceding notes -->
<app>
    <rdg source="#critApp.source1">
        <note dur="2" oct="4" pname="b" stem.dir="down"/>
    </rdg>
    <rdg source="#critApp.source2">
        <note dur="2" oct="4" pname="b" stem.dir="up"/>
    </rdg>
</app>
<!-- following notes -->
</layer>
```

Listing 353.

or to indicate more significant differences, such as the insertion of extra measures:

```
<section>
<measure>...</measure>
<measure>...</measure>
<app>
```

```
<rdg source="#critApp.source1"/>
<rdg source="#critApp.source2">
  <!-- source 2 has 2 measures not found in source 1 -->
  <measure>...</measure>
  <measure>...</measure>
</rdg>
</app>
<measure>...</measure>
</section>
```

Listing 354.

However, the flexibility in the location of `<app>` places a burden on the encoder to ensure that the `<app>`, `<rdg>`, and `<lem>` elements are used correctly; that is, the content of every `<rdg>` and `<lem>` has to be a valid replacement for its parent `<app>`, even though this cannot be controlled effectively by the MEI schema.

### 11.1.3 Variants in Score Definitions

In addition to its use for differentiation of the musical content of multiple sources, `<app>` may also be utilized to describe the layout of different scores, even when the musical content itself remains the same. An example of this is two sources that have the same content, but a different ordering of staves on which the content is written. By definition, the order of staves in MEI is described in and derived from the order of `<staffDef>` elements in `<scoreDef>`, not from the order of `<staff>` elements within a `<measure>`. The `<staff>` element in a measure points to its corresponding `<staffDef>` using the same value for `n` on both elements.

This rather loose mechanism makes it possible to point dynamically to the correct staff definition for a given source. The following example demonstrates how this can be accomplished for two sources, both presenting a two-staff score, but with differing staff order. No further `<app>` element is necessary within the `<measure>` to describe the alternative score order of the sources.

```
<score>
  <app>
    <rdg source="#critApp.source1">
      <scoreDef>
        <staffGrp>
          <staffDef n="1"/>
          <staffDef n="2"/>
        </staffGrp>
      </scoreDef>
    </rdg>
    <rdg source="#critApp.source2">
      <scoreDef>
        <staffGrp>
          <!-- The order of <staffDef> elements defines score order, not its @n attribute! -->
          <staffDef n="2"/>
        </staffGrp>
      </scoreDef>
    </rdg>
  </app>
</score>
```

```

        <staffDef n="1"/>
    </staffGrp>
</scoreDef>
</rdg>
</app>
<section>
    <measure>
        <staff n="1">...</staff>
        <staff n="2">...</staff>
    </measure>
</section>
</score>

```

Listing 355.

When unique values for n on `<layerDef>` and `<layer>` are provided, it is possible to reallocate layers in the same fashion as staves.

This mechanism may also be used to describe not only differing page orientations, formats and margins, but also clefs and keys.

The use of `<app>` in conjunction with `<staffDef>` illustrates the greater flexibility of connecting `<staff>` and `<staffDef>` by a shared n value. A technically more robust alternative to n would be to use the def attribute on `<staff>`, which points to the xml:id of a `<staffDef>`. However, this strong connection would be tied to one specific `<staffDef>`, and would not allow to pick one alternative out of an `<app>`.

#### 11.1.4 Nesting Apparati

In some situations, musical sources will agree at one level while differing at a lower level. For these cases, `<app>` elements may be nested to any level necessary. In the following example, there are three sources, two of which agree on the addition of a measure, but differ in the content of the added measure:

```

<section>
    <measure>...</measure>
    <app>
        <rdg source="#critApp.source1"/>
        <rdg source="#critApp.source2 critApp.#source3">
            <!-- whereas source1 omits it, source2 and source3 have an additional measure -->
            <measure>
                <staff>
                    <layer>
                        <app>
                            <!-- while source2 provides a measure rest, source3 has a whole note -->
                            <rdg source="#critApp.source2">
                                <mRest/>

```

```
</rdg>
<rdg source="#critApp.source3">
    <note dur="1" oct="3" pname="g"/>
</rdg>
</app>
</layer>
</staff>
</measure>
</rdg>
</app>
<measure>...</measure>
</section>
```

Listing 356.

When nesting `<app>` elements, it is important that the value(s) in the child `<rdg>` element's source attribute must be a strict subset of the ancestor `<rdg>` element's source value.

## 11.2 Editorial Markup

It is often necessary to render an account of any changes made to a musical text during its creation (and any subsequent editing) and to accommodate editorial comment necessitated by an editorial process. The elements and attributes described in this chapter may be used to record such editorial interventions, whether made by the composer, the copyists of the manuscript, the editor of an earlier edition used as a copy text, or the current encoder/editor.

The scope of the elements described herein is therefore the description of features relating to the genesis, later revision and editorial interpretation of a text. Mechanisms for describing multiple sources are described in chapter 11.1 Critical Apparatus of these Guidelines, while the full setup for genetic editions is described in chapter 11.3 Genetic Markup.

The elements described in this chapter may be contained by a wide range of other MEI elements and, in turn, may contain a variety of elements. The encoder must assume responsibility for the appropriateness of the markup; that is, a great many combinations of editorial and transcriptional markup are technically possible, but care must be taken to see that the encoding does not contravene the rationale of these Guidelines. In general, it should be ensured that a file would be valid if the editorial markup would be omitted, as such a validation cannot be ensured in an efficient way by the MEI schema.

For most of the elements discussed here, some encoders may wish to indicate both a responsibility; that is, a coded value indicating the person or agency responsible for making the editorial intervention in question, and an indication of the degree of certainty which the encoder wishes to associate with the intervention. The elements discussed here thus may potentially carry the following optional attributes:

**cert** ([att.evidence](#)) Signifies the degree of certainty or precision associated with a feature.

**resp** Indicates the agent(s) responsible for some aspect of the text's transcription, editing, or ([att.responsibility](#)) encoding. Its value must point to one or more identifiers declared in the document header.

They are available through the generic attribute class [att.common](#), which is a member of [att.responsibility](#), and the attribute class [att.edit](#), to which these elements subscribe.

Many of the elements discussed here can be used in two ways. Their primary purpose is to indicate that their content represents an editorial intervention (or, in some cases, the lack of intervention) of a specific kind. Sometimes, pairs or other meaningful groupings of such elements can be recorded, then wrapped within the special purpose **<choice>** element:

**<choice>** Groups a number of alternative encodings for the same point in a text.

Wrapping elements this way enables the encoder to represent, for example, a text in its 'original', uncorrected form alongside the same text in one or more 'edited' forms. Making use of this style of representation, software may dynamically switch between the 'Urtext view' of the text and one or more 'views' of the text after the application of the encoded editorial interventions.

Elements which can be combined in this way constitute the `model.choicePart` class. The default members of this class are `<sic>`, `<corr>`, `<reg>`, `<orig>`, and `<unclear>`. As `model.editLike` and `model.editorialLike` are members of `model.choicePart`, `<choice>`, `<subst>`, `<abbr>`, and `<expan>` can also be combined with the other elements. All of their functions and usage are described in greater detail below.

Three categories of editorial intervention are discussed by the remainder of this chapter:

- indication or correction of apparent errors;
- indication of regularization of variant, irregular, non-standard, or eccentric forms; and
- editorial additions, suppressions, and omissions.

### 11.2.1 Abbreviations

MEI offers methods for marking abbreviations in prose, as in the following example:

---

```
<p> ... the next passage shall be performed in  
<abbr>pno:</abbr>  
... </p>
```

Listing 357.

---

or abbreviations in the music itself, as in the following example:

---

```
<abbr>  
  <bTrem unitdur="16">  
    <note dur="4" oct="5" pname="c" stem.mod="2slash"/>  
  </bTrem>  
</abbr>
```

Listing 358.

---

The generic type attribute may be used to classify the abbreviation according to a convenient typology. Sample values include:

- suspension** the abbreviation provides the first letter(s) of the word or phrase, omitting the remainder;
- contraction** the abbreviation omits some letter(s) in the middle;
- brevigraph** the abbreviation comprises a special symbol or mark;
- superscription** the abbreviation includes writing above the line;
- acronym** the abbreviation comprises the initial letters of the words of a phrase;

- title** the abbreviation is for a title of address (Dr, Ms, Mr, ...);
- organization** the abbreviation is for the name of an organization;
- geographic** the abbreviation is for a geographic name.

This tag is the mirror image of the `<expan>` tag (not to be confused with the `<expansion>` element described in 2.1.2.2 Content of Musical Divisions). Both `<abbr>` and `<expan>` allow the encoder to transcribe an abbreviation and its expansion. In the case of `<abbr>`, the original is transcribed as the content of the element and the expansion as an attribute value, while `<expan>` reverses this. The choice between the two is up to the user. For example:

```
<div>
  <!-- using abbr -->
  <p>... the next passage shall be performed in
    <abbr expan="piano">pno:</abbr>
    ...
  </p>
  <!-- using expan -->
  <p>... the next passage shall be performed in
    <expan abbr="pno:">piano</expan>
    ...
  </p>
</div>
```

Listing 359.

The `<abbr>` tag is not required; if appropriate, the encoder may transcribe abbreviations in the source text silently, without tagging them. If abbreviations are not transcribed directly but expanded silently, then the MEI header should indicate this is the case. The cert attribute signifies the degree of certainty ascribed to the expansion of the abbreviation. The expan attribute gives an expansion of the abbreviation. The resp attribute contains an ID reference to an element containing the name of the editor or transcriber responsible for supplying the expansion of the abbreviation.

When the content of the abbr or expan attributes requires additional markup, an attribute cannot be used. In this case, the abbreviated and expanded forms must be presented within elements. Furthermore, as alternatives to each other, the `<abbr>` and `<expan>` elements must be wrapped by the `<choice>` element, as described above. The previous example, where the 'o:' in 'pno:' is written as superscript, would be encoded as:

```
<p>... the next passage shall be performed in
  <choice>
    <abbr>pn
      <rend rend="sup">o:</rend>
    </abbr>
    <expan>piano</expan>
  </choice>
</p>
```

---

Listing 360.

---

### 11.2.1.1 Instructions

Many musical scores make use of various kinds of shorthand notation which omit some parts of the score that have already been written elsewhere. Typical examples for this are symbols that indicate repetition of the preceding measure or beat. In MEI, these symbols can be encoded using the  [<mRpt>](#) and  [<beatRpt>](#) elements respectively. Often, similar graphical symbols (often one or two slashes, "/") are used to mean that the current staff should have the same or similar content as another staff.

*colla parte* directives have a less strictly-defined scope than the 'Rpt elements' ( [<beatRpt>](#),  [<halfmRpt>](#),  [<mRpt>](#),  [<mRpt2>](#),  [<multiRpt>](#)). That is, rather than specifying the repetition of content of a particular duration, like a measure or beat, *colla parte* instructions can refer to material of any length. In order to encode such scribal shorthand, MEI offers the  [<cpMark>](#) element, which allows filling of blank spaces in the score with horizontally and/or vertically distant material.

**<cpMark>** A verbal or graphical indication to copy musical material written elsewhere.

Like any other 'controlEvent' (see  [1.2.2 Events and Controlevents](#)),  [<cpMark>](#) is placed in the score using the staff and tstamp attributes. The end point of the mark itself, when necessary, may be indicated using the tstamp2 attribute. The source material, which is intended to be inserted in the space indicated by the copy mark, can be identified by the attributes origin.tstamp, origin.tstamp2, origin.staff and origin.layer. While origin.tstamp provides the relative distance from the beginning of the "gap", origin.tstamp is relative to the position identified by origin.tstamp. However, origin.tstamp defaults to the same value as tstamp2 and should only be provided when necessary. When neither origin.staff nor origin.tstamp are provided, they take the same values as the cpMark's staff and tstamp attributes; that is, they indicate a strict 'vertical' or 'horizontal' copy.

Figure 125. Copy marks in the first and second violin of C.M.v.Weber's Freischütz, Autograph, Nr.3 (Walzer), measures 223-231

---

In the example above, there are no less than three different copy instructions, which need to be encoded with four `<cpMark>` elements. First, Weber inserts characters from "a" to "f" in red ink to identify filled measures. Then, he repeats the same characters in *empty* measures, which indicates that the content from the *filled* measures should be copied here. While one could try to encode this with just one `<cpMark>` element, it is both clearer and easier to process when using two elements.

The second and third shorthand indications are written in the second violin (lower staff). Here, Weber writes "unis.[ono]", silently omitting the reference to the first violin. His next shorthand ("in 8va") additionally instructs the copyist to double the written material in another octave. This information can be captured using the `dis` and `dis.place` attributes on `<cpMark>`.

```
<cpMark origin.tstamp="-6m+1" staff="8" tstamp="1" tstamp2="5m+4">a. b. c. d. e. f. g.</cpMark>
<cpMark origin.tstamp="-6m+1" staff="9" tstamp="1" tstamp2="5m+4">a. b. c. d. e. f. g.</cpMark>
<cpMark origin.staff="8" staff="9" tstamp="1.5" tstamp2="1m+3.5">unis:</cpMark>
<cpMark dis="8" dis.place="below" origin.staff="8" staff="9" tstamp="2" tstamp2="2m+3.5">in
8va</cpMark>
```

Listing 361.

Figure 126. A transcription of the example above with all shorthand resolved and colored

Text used as a copy mark, like the letters in the Weber example, may be encoded as content of the `<cpMark>` element. In the case of non-text marks, the `altsym` and `facs` attributes may be used to refer to a graphical surrogate.

Depending on the purpose of the encoding, the omitted parts in the score may be filled with `<space>` and `<mSpace>` elements of appropriate duration or silently overwritten with the content that the `<cpMark>` identifies. Also, these two options may be combined through the use a `<choice>` element whose `<abbr>` and `<expan>` children explicitly encode a transcription of the original 'gap' (in abbr) and the result of the insertion of the indicated material (in expan, see [11.2.1 Abbreviations](#)).

## 11.2.2 Apparent Errors

When the source material to be encoded is manifestly faulty, an encoder or transcriber may elect simply to correct it without comment, although for scholarly purposes it will often be more generally useful to record both the correction and the original state of the text. The elements described here enable all three approaches, and allows the last to be done in a way that makes it easy for software to present either the original or the correction.

**<sic>** Contains apparently incorrect or inaccurate material.

**<corr>** Contains the correct form of an apparent erroneous passage.

The following examples show alternative treatment of the same material. The text to be encoded contains a chord (c4, e4, g4, a4), where c4, e4, and a4 are quarter notes, but g4 is incorrectly written as a half note.

An encoder may choose to silently correct the engraver's error:

---

```
<chord>
  <note dur="4" oct="4" pname="c"/>
  <note dur="4" oct="4" pname="e"/>
  <note dur="4" oct="4" pname="g"/>
  <note dur="4" oct="4" pname="a"/>
</chord>
```

Listing 362.

---

or the correction may be made explicit:

---

```
<chord>
  <note dur="4" oct="4" pname="c"/>
  <note dur="4" oct="4" pname="e"/>
  <corr>
    <note dur="4" oct="4" pname="g"/>
  </corr>
  <note dur="4" oct="4" pname="a"/>
</chord>
```

Listing 363.

---

Alternatively, the encoder may simply record the typographic error without correcting it, either without comment or with a **<sic>** element to indicate the error is not a transcription error in the encoding:

---

```
<chord>
  <note dur="4" oct="4" pname="c"/>
  <note dur="4" oct="4" pname="e"/>
  <sic>
    <note dur="2" oct="4" pname="g"/>
  </sic>
  <note dur="4" oct="4" pname="a"/>
</chord>
```

Listing 364.

---

If the encoder elects to record the original source text and provide a correction for the sake of transparency, both `<sic>` and `<corr>` may be used, wrapped in a `<choice>` element. The order of the `<sic>` and `<corr>` elements is not significant:

```
<chord>
<note dur="4" oct="4" pname="c"/>
<note dur="4" oct="4" pname="e"/>
<choice>
  <sic>
    <note dur="2" oct="4" pname="g"/>
  </sic>
  <corr>
    <note dur="4" oct="4" pname="g"/>
  </corr>
</choice>
<note dur="4" oct="4" pname="a"/>
</chord>
```

Listing 365.

An indication of the person or agency responsible for the emendation can be provided as follows:

```
<!-- within the header for this document: -->
<respStmt>
  <name role="editor" xml:id="editTrans.JK">Johannes Kepper</name>
</respStmt>
<!-- ... -->
<chord>
  <note dur="4" oct="4" pname="c"/>
  <note dur="4" oct="4" pname="e"/>
  <choice>
    <sic>
      <note dur="2" oct="4" pname="g"/>
    </sic>
    <corr resp="#editTrans.JK">
      <note dur="4" oct="4" pname="g"/>
    </corr>
  </choice>
  <note dur="4" oct="4" pname="a"/>
</chord>
```

Listing 366.

Here the `resp` attribute has been used to indicate responsibility for the correction. Its value (`#editTrans.JK`) is an example of the pointer values discussed in section [13 Linking Data](#). In this case, the `resp` attribute points to a `<name>` element within the metadata header, but any element might be indicated in this way, if the correction

has been taken from some other source. The resp attribute is available for all elements which are members of the `att.common` class (through `att.responsibility`). The `att.edit` class makes available a cert attribute (through `att.evidence`), which may be used to indicate the degree of editorial confidence in a particular correction, as in the following example:

```
<chord>
  <note dur="4" oct="4" pname="c"/>
  <note dur="4" oct="4" pname="e"/>
  <choice>
    <sic>
      <note dur="2" oct="4" pname="g"/>
    </sic>
    <corr cert="high">
      <note dur="4" oct="4" pname="g"/>
    </corr>
  </choice>
  <note dur="4" oct="4" pname="a"/>
</chord>
```

Listing 367.

---

Where, as here, the correction takes the form of amending information present in the text being encoded, the encoder should use the `<corr>` element. Where the correction is present in the text being encoded, and consists of some combination of visible additions and deletions, the elements `<add>` and / or `<del>` should be used. For additional information on the use of `<add>` and `<del>`, see section 11.2.4.2 Additions and Deletions. Where the correction takes the form of an addition of material not present in the original because of physical damage or illegibility, the `<supplied>` element may be used. Where the ‘correction’ is simply a matter of expanding abbreviated notation, the `<expan>` element may be used.

### 11.2.3 Regularization and Normalization

When the musical source makes extensive use of unusual symbol shapes or non-standard notation features, it may be desirable for a number of reasons to regularize it; that is, provide ‘standard’ or ‘regularized’ forms that are equivalent to the non-standard forms.

As with other such changes to the source text, the changes may be made silently (in which case the MEI header should still specify the types of silent changes made) or may be explicitly marked using the following elements:

**<reg>** Contains material which has been regularized or normalized in some sense.

**<orig>** Contains material which is marked as following the original, rather than being normalized or corrected.

**<choice>** Groups a number of alternative encodings for the same point in a text.

Consider this traditional soprano clef appearing somewhere in the course of a musical piece:

Figure 127. Soprano clef from the begin of Heinrich Schütz' St. Matthew's Passion.

An encoder may choose to preserve this original clef, but flag it as nonstandard from the perspective of current practice by using the `<orig>` element with no attributes specified, as follows:

```
<orig>
  <clef line="1" shape="C"/>
</orig>
```

Listing 368.

Alternatively, the encoder may indicate that the clef has been modernized into a G-clef by using the `<reg>` element with no attributes specified, as follows:

```
<reg>
  <clef line="2" shape="G"/>
</reg>
```

Listing 369.

As another alternative, the encoder may encode both the old and modernized shapes, so that applications may render both at the reader's will:

```
<choice>
  <orig>
    <clef line="1" shape="C"/>
  </orig>
  <reg>
    <clef line="2" shape="G"/>
  </reg>
</choice>
```

Listing 370.

As described above, the resp attribute may be used to specify the agent responsible for the regularization.

## 11.2.4 Additions, Deletions, and Omissions

The following elements are used to indicate when single notational symbols have been omitted from, added to, or marked for deletion from, a musical text. Like the other editorial elements described in this chapter, they allow for a wide range of editorial practices:

**<gap>** Indicates a point where material has been omitted in a transcription, whether as part of sampling practice or for editorial reasons described in the MEI header.

**<unclear>** Contains material that cannot be transcribed with certainty because it is illegible or inaudible in the source.

reason              Holds a short phrase describing the reason for missing textual material (gap), why material is supplied (supplied), or why transcription is difficult (unclear).

**<add>** Marks an addition to the text.

**<del>** Contains information deleted, marked as deleted, or otherwise indicated as superfluous or spurious in the copy text by an author, scribe, annotator, or corrector.

### 11.2.4.1 Omissions, Unclear Readings, Damage, and Supplied Readings

Encoders may choose to omit parts of the source for reasons ranging from illegibility, (making transcription difficult or impossible), to editorial policy, e.g., systematic exclusion of poetry or prose from an encoding. The full details of the policy decisions concerned should be documented in the MEI header (see section [3.4.2 Encoding Description](#)). Each place in the text at which omission has taken place should be marked with a **<gap>** element, optionally with further information about the reason for the omission, its extent, and the person or agency responsible for it, as in the following examples:

---

```
<gap extent="2" reason="illegible" unit="quarter_note"/>
```

Listing 371.

---

```
<gap extent="several notes" reason="overwriting illegible"/>
```

Listing 372.

---

Note that the extent of the gap may be marked precisely using attributes unit and extent.

Unlike TEI, MEI does not offer a *desc* element for further description of the reason for a gap. Instead, an **<annot>** may refer to the gap via its startid, endid, or plist attributes and provide additional information.

The `<unclear>` element is used to mark passages in the original which cannot be read with confidence, or about which the transcriber is uncertain for other reasons, as for example when transcribing an illegible source. Its reason and resp attributes are used, as with the `<gap>` element, to indicate the cause of uncertainty and the person responsible for the conjectured reading.

```
<note dur="4" oct="4" pname="c">
  <unclear reason="ink blot">
    <artic artic="acc"/>
  </unclear>
</note>
```

Listing 373.

Where the difficulty in transcription arises from an identifiable cause, the agent attribute signifies the causative agent. The cert attribute signifies the degree of certainty ascribed to the transcription of the text contained within the `<unclear>` element. Where the difficulty in transcription arises from action (partial deletion, etc.) assignable to an identifiable hand, the hand attribute may record the hand responsible for the action.

When the reason for a gap in the encoding is damage of the document carrier (the paper on which the document is written, for example), the `<damage>` element should be used instead of the `<gap>` element. In the case of damage resulting from an identifiable cause, the agent attribute signifies the causative agent. The degree attribute signifies the degree of damage according to a convenient scale. A `<damage>` tag with this attribute should only be used where the text may be read with some confidence; data supplied from other sources should be tagged as `<supplied>`. The extent attribute indicates approximately how much text is in the damaged area, in notes, measures, inches, or any appropriate unit, where this cannot be deduced from the contents of the tag. For example, the damage may span structural divisions in the text so that the tag must then be empty of content. In the case of damage (deliberate defacement, etc.) assignable to an identifiable hand, the hand attribute signifies the hand responsible for the damage.

Sometimes the editor provides information not present in the source material. These conjectures or emendations are marked up in MEI using the `<supplied>` element.

The following example demonstrates the use of the `<supplied>` element in combination with `<gap>` within `<subst>`:

```
<beam>
  <note dur="4" oct="3" pname="c"/>
  <note dur="4" oct="3" pname="d"/>
  <subst>
    <gap extent="two eighth notes" reason="missing notes"/>
    <supplied>
      <note dur="4" oct="3" pname="e"/>
      <note dur="4" oct="3" pname="f"/>
    </supplied>
  </subst>
</beam>
```

```
</supplied>
</subst>
<note dur="4" oct="3" pname="g"/>
<note dur="4" oct="3" pname="a"/>
</beam>
```

Listing 374.

When the presumed loss of text arises from an identifiable cause, agent signifies the causative agent. When the presumed loss of text arises from action (partial deletion, etc.) assignable to an identifiable hand, the hand attribute signifies the hand responsible for the action. The reason attribute indicates why the text has to be supplied, e.g., 'overbinding', 'faded ink', 'lost folio', 'omitted in original', etc. The source attribute contains the source of the supplied text. The editor(s) responsible for supplied material may be recorded in the resp attribute. The value of resp must point to one or more identifiers declared in the document header. The cert attribute signifies the degree of certainty ascribed to the supplied material.

#### 11.2.4.2 Additions and Deletions

The `<add>` and `<del>` elements may be used to record where material has been added or deleted in the source material.

The following example demonstrates the usage of `<add>` to mark up a note being added to an existing chord:

```
<chord>
  <note pname="c"/>
  <note pname="e"/>
  <note pname="g"/>
  <add>
    <note accid="f" pname="b"/>
  </add>
</chord>
```

Listing 375.

The next example shows how `<del>` may be used to capture the information that two measures have been cancelled. As seen in this example, the rend attribute is used to specify the method of deletion.

```
<section>
  <measure>
    <!-- ... -->
  </measure>
```

```

<measure>
  <!-- ... -->
</measure>
<del rend="strike">
  <measure>
    <!-- ... -->
  </measure>
  <measure>
    <!-- ... -->
  </measure>
</del>
<measure>
  <!-- ... -->
</measure>
</section>

```

Listing 376.

Additional information for both elements may be specified using attributes. Whereas the hand attribute marks responsibility for the textual change, the resp attribute is used to refer to the editor who identified this textual change as such. The cert attribute signifies the degree of certainty ascribed to the identification of the hand of the deletion or addition.

The `<add>` element should not be used to mark editorial changes, such as supplying a note omitted by mistake from the source text or a passage present in another source. In these cases, either the `<corr>` or `<supplied>` tags should be used instead.

#### 11.2.4.3 Substitutions, Restorations, and Handshifts

When several interventions to the musical text are to be regarded as a single action, they may be grouped using the `<subst>` element. The most common combination is a replacement of portions of the musical text using both the `<add>` and `<del>` element, as seen in the following example:

```

<layer>
  <!-- preceding content -->
  <subst>
    <del>
      <note dur="4" oct="4" pname="c"/>
    </del>
    <add>
      <beam>
        <note dur="8" oct="4" pname="c"/>
        <note dur="8" oct="4" pname="d"/>
      </beam>
    </add>
  </subst>

```

```
</add>
</subst>
<!-- subsequent content -->
</layer>
```

---

### Listing 377.

---

An intervention closely related to substitution is the restoration of a previously deleted section. For this purpose MEI offers the `<restore>` element, which may contain a `<del>` or other content directly.

The following example illustrates an instance where a lyric was cancelled and later restored by overwriting it:

---

```
<note dur="4" oct="4" pname="c">
  <syl>
    <restore desc="overwritten">
      <del>God</del>
    </restore>
  </syl>
</note>
```

---

### Listing 378.

---

The `desc` attribute gives a prose description of the means of restoration. The `cert` attribute signifies the degree of certainty ascribed to the identification of the hand of the restoration. The `type` attribute may be used to indicate the action cancelled by the restoration. The `resp` attribute contains an ID reference to an element containing the name of the editor or transcriber responsible for identifying the hand of the restoration. The `hand` attribute signifies the hand of the agent which made the restoration.

MEI offers a `<handShift>` milestone element that can be used to mark a change of scribe or scribal style.

The `character` attribute describes characteristics of the hand, particularly those related to the quality of the writing, e.g., 'shaky', 'thick', 'regular'. A description of the tint or type of ink, e.g., 'brown' or the writing medium, e.g., 'pencil', may be placed in the `medium` attribute.

---

```
<layer>
  <note pname="f"/>
  <note pname="a"/>
  <handShift medium="blue ink"/>
  <note pname="c"/>
  <note pname="e"/>
</layer>
```

---

### Listing 379.

---

The new hand may be identified using the new attribute, while the previous hand may be recorded in the old attribute. The resp attribute contains an ID reference to an element containing the name of the editor or transcriber responsible for identifying the change of hand. The cert attribute signifies the degree of certainty ascribed to the identification of the new hand.

When using this element within a layer, it is important to ensure that all layers and staves are considered. Every `<handShift>` affects only the content of its own layer and staff, even in the following measures. Therefore, there must be a separate `<handShift>` for every `<staff>` and `<layer>`. This mechanism allows the description of shifts at timestamps that differ between each staff.

DEVELOPMENT  
VERSION

## 11.3 Genetic Markup

Genetic editions try to trace the creation of a (musical) work in all its recorded details, from the first sketches to the 'final' complete text. The aim of genetic textual criticism is to investigate compositional working and thinking processes - the genesis of compositions. In contrast to traditional scholarly editions, which focus on the constitution of a performable text of a work, Genetic Textual Criticism focuses on the process of production, the gradual elaboration of musical thoughts while writing. It is dependent on the availability of comprehensible traces of these writing processes. Genetic editions often have to deal with significant uncertainties, and they require a considerable amount of markup, as detailed below.

### 11.3.1 Encoding Genetic States

Leaving aside temporary breaks, a compositional process is continuous: the composer's writing operations have happened in a strict order, which could be specified if his working would have been filmed. However, this exact order is rarely ever recoverable from the surviving manuscripts, prints or other materials. Instead, relative statements can be made – the red pencil must have been written after the brown ink etc. Instead of a continuous movie, scholars are often only able to reconstruct a slide show, reflecting certain recoverable states of the composition. Very often, those states have a local range only – the order of two states on one page may be known, as is the order of two other states on a second page. This doesn't necessarily allow to identify the succession of all four states.

MEI utilizes the `<genDesc>` element to describe the recoverable genetic states of a work. It is nested inside `<music>` and may contain a number of `<genState>` elements.

**<genDesc>** (genetic description) - Bundles information about the textual development of a work.

**<genState>** Describes a distinctive state in the textual development of a work.

A genetic description is used to bundle all known states of a work. The ordered attribute may be used to specify whether the order of child elements of the `<genDesc>` matches their temporal order, or if their temporal order is unknown. As `<genDesc>` may be self-nested, it is possible to specify the order of some states within a larger unordered set of genetic states, or to position a set of states with unknown temporal order in a larger ordered set.

```
<genDesc ordered="false">
  <genState label="State A"/>
  <genState label="State B"/>
<genDesc ordered="true">
  <genState label="State C1"/>
  <genState label="State C2"/>
  <genState label="State C3"/>
</genDesc>
</genDesc>
```

---

Listing 380.

---

In the above example, the temporal relation of states A, B and all of C is not known, but it is known that C1 precedes C2 and C3.

Even when the temporal order of a set of states is not fully recoverable, some arguments about relative chronology may be available. It is possible to encode these statements with the precision the editor feels comfortable with, utilizing the attributes next and prev (for immediate successors / predecessors), and precedes and follows (for relative successors / predecessors).

Genetic states can be further described by using any combination of the `<desc>`, `<date>`, and `<respStmt>` children of `<genState>`.

### 11.3.2 Referencing Genetic States

While the (relative) chronology of genetic states may be encoded using the `<genDesc>` element (see 11.3.1 Encoding Genetic States), the textual operations they manifest in are encoded using the regular `<add>`, `<del>`, etc. elements are used (see 11.2.4 Additions, Deletions, and Omissions). However, for a genetic edition these elements are linked to their corresponding `<genState>` element using the state attribute.

```
<!-- definition of a state within genDesc -->
<genState xml:id="genetic.stateX"/>
<!-- somewhere later in the musical text: -->
<subst state="#genetic.stateX">
  <del>
    <clef shape="C" line="1"/>
  </del>
  <add>
    <clef shape="G" line="2"/>
  </add>
</subst>
```

Listing 381.

In the example above, state X of the encoded work is established by the change from a C clef to a G clef. Other states preceding state X will read a C clef, while state X and succeeding states read a G clef. A genetic state of the work is constituted by performing all textual operations referencing that state, i.e., by carrying out all additions, deletions and restorations.

The instant attribute on `<del>` etc. allows to specify that corresponding modification has been carried out immediately after writing the original text, so that no separate genetic state has been established.

It is up to encoder to identify the appropriate level of granularity: In an ideal world, the writing or cancellation of a single note would constitute a new state. In practice, this level of detail isn't feasible, and the combination of multiple writing operations into larger logical operations seems inevitable. However, this may range from very large tasks ('replacing the second movement of a symphony') to very small ones ('adding the slurs for the viola in measures 22 and 23'), depending on the intentions and scope of the encoding.

### 11.3.3 Encoding Metatexts

The arguments used to establish a chronological order of genetic states are sometimes found in external sources like letters, but very often they are to be found in the witnesses holding the musical text, even though they are typically not part of the text itself. Examples for such arguments are the writing medium, spacing, marginal notes, among others.

Some of these so-called ‘metatexts’ can be encoded using MEI, namely those that are written into the relevant sources. For this purpose, MEI offers the [metaMark](#) element, as known from the TEI.

**<metaMark>** A graphical or textual statement with additional / explanatory information about the musical text. The textual consequences of this intervention are encoded independently via other means; that is, with elements such as [<add>](#), [<del>](#), etc.

A metaMark is provided as a ‘controlEvent’ (see [1.2.2 Events and Controlevents](#)); as such, by convention, it should be encoded at the end of the [<measure>](#) where it first occurs. It is highly recommended to specify the function of the metaMark using its function attribute, which may take the following values:

- *confirmation*: confirmation of a previous textual decision; i.e., cancellation of a deleted passage in a different writing medium.
- *addition*: denoted material is to be inserted in the musical text.
- *deletion*: denoted material is no longer part of the musical text.
- *substitution*: denoted material is replaced, either by the musical text pointed at with the target attribute or the musical content of the metaMark element itself.
- *clarification*: attempt to clarify a potentially illegible or otherwise unclear part of the musical text.
- *question*: marks a section of the musical text which is to be considered further.
- *investigation*: marks a section of the musical text as an investigation of the consequences of certain compositional decisions or potential alternatives.
- *restoration*: declares a formerly cancelled part of the musical text as valid again.
- *navigation*: clarification of the reading order of the musical text.

Some metaMarks may have actual content, like marginal notes. This content may be transcribed inside the [metaMark](#) element. It also has a facs attribute to refer back to the corresponding sections of a facsimile.

It is important to keep in mind that [metaMark](#) elements do not encode the textual consequences they transport – this is an encoding of the sign, not of its meaning, which can be encoded in other elements like [restore](#).

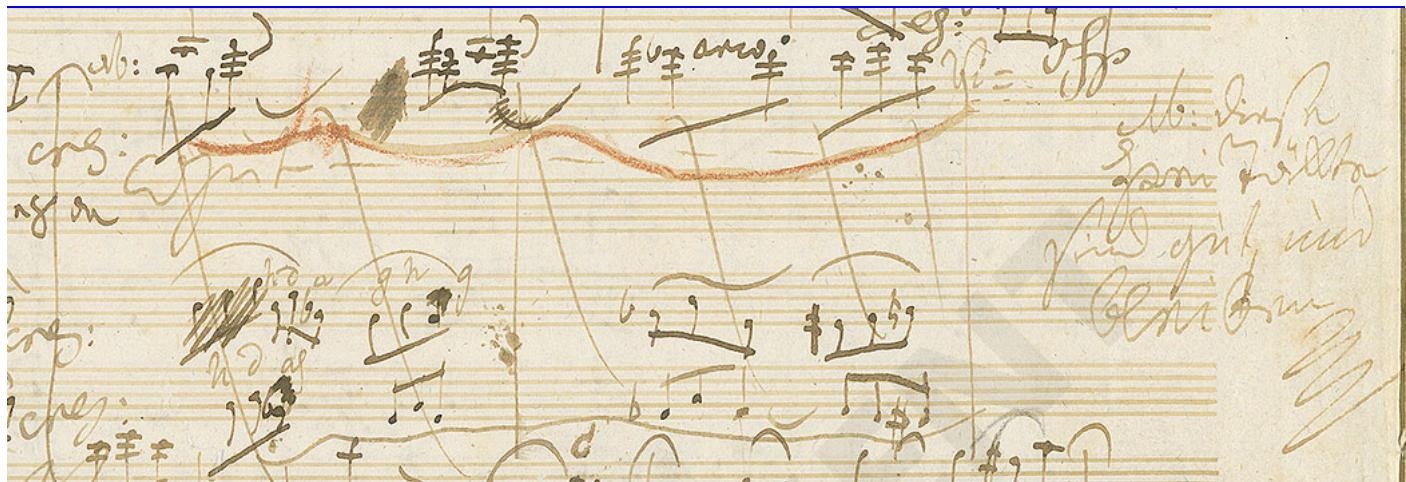

Figure 128. metaMarks in Beethoven's op.59.3, p.18

The above excerpt from a Beethoven manuscript holds a number of different metaMarks, some of which are encoded in the following examples:

```
<metaMark staff="1" place="below" function="restoration">gut</metaMark>
```

Listing 382.

The metaMark above captures the word 'gut' (good) Beethoven wrote below the red pencil, which indicates that the formerly deleted text of the two measures shown shall be kept.

```
<metaMark function="clarification"> Nb: diese
<lb/>
Zwei Takte
<lb/>
sind gut, und
<lb/>
bleiben </metaMark>
```

Listing 383.

This `<metaMark>` transcribes Beethoven's marginal note explaining the same situation as above.

```
<metaMark staff="3" place="above" tstamp="4" function="clarification">g</metaMark>
```

Listing 384.

This third metaMark covers one of the letters Beethoven inserted to clarify the pitch of that given note.

#### **11.3.4 Genetic Changes at the Page Level**

In genetic editions, it may also be of interest to trace when pages are added and / or removed from manuscripts. The general information about pages can be encoded using the [`<foliaDesc>`](#) element, as described in [3.7.2 Description of folia](#). It is possible to wrap the elements used there, including [`<patch>`](#) and [`<cutout>`](#) with editorial markup like [`<add>`](#) and [`<del>`](#). These elements can then be used to reference [`<genState>`](#) as described in [11.3.2 Referencing Genetic States](#).

# 12 Facsimiles and Recordings

MEI can be used to connect an encoding of some sort – either a transcription of existing material, or the specification of some expected output in some form – with existing sources. This existing material may be in different formats – music notation in any combination of print and manuscript, or audio or video footage. The concepts for establishing such connections between encoded music and source material is described in the following chapters.

## 12.1 Facsimiles

Most often, MEI is used for the preparation of a digital musical text based on an existing music document, or with the intention of rendering the encoded notation into a document or audio rendition. MEI can, however, be used to provide a different kind of digital reproduction of a source document, which relies on the description and provision of digital imagery. Both approaches may be combined, so that the encoding of the musical content and digital facsimiles may add different facets to the same MEI document.

### 12.1.1 Elements of the Facsimile Module

This module makes available the following elements for encoding facsimiles:

**<facsimile>** Contains a representation of a written source in the form of a set of images rather than as transcribed or encoded text.

**<surface>** Defines a writing surface in terms of a rectangular coordinate space, optionally grouping one or more graphic representations of that space, and rectangular zones of interest within it.

**<zone>** Defines an area of interest within a **<surface>** or graphic file.

These element are used to add a separate subtree to MEI, starting with the **<facsimile>** element inside **<music>**, as seen in the following example:

```
<mei>
  <meiHead>
    <!-- metadata header -->
  </meiHead>
  <music>
    <facsimile>
      <!-- The facsimile subtree starts here. -->
    </facsimile>
    <body>
      <!-- The encoding of the musical content goes here. -->
    </body>
  </music>
</mei>
```

Listing 385.

It is possible to have more than one `<facsimile>` element in this location. This is especially useful when multiple sources are encoded in the same file using the mechanisms described in chapter 11.2 Editorial Markup of these Guidelines. In this case, the `decls` (declarations) attribute of `<facsimile>` may be used to refer to a source defined in the document's header, as seen in the following example:

```
<mei>
  <meiHead>
    <fileDesc>
      <sourceDesc>
        <source xml:id="facsimile.source1">
          <!-- description of source -->
        </source>
      </sourceDesc>
    </fileDesc>
  </meiHead>
  <music>
    <facsimile decls="#facsimile.source1">
      <!-- facsimile content -->
    </facsimile>
  </music>
</mei>
```

---

Listing 386.

When using the FRBR model (see 3.5 Functional Requirements for Bibliographic Records (FRBR)), it is equally possible to reference a `<manifestation>` element instead of `<source>`.

Within a `<facsimile>` element, each page of the source is represented by a `<surface>` element. Each surface may be assigned an identifying string utilizing the `label` attribute. In addition, it may encapsulate more detailed metadata about itself in a `<figDesc>` element. The coordinate space of the surface may be recorded in abstract terms in the `ulx`, `uly`, `lrx`, and `lry` attributes. For navigation purposes, `<surface>` has a `startid` attribute that accommodates pointing to the first object appearing on this particular writing surface.

```
<facsimile>
  <surface label="page 1" lrx="2000" lry="3000" startid="#measure1" ulx="0" uly="0"/>
</facsimile>
```

---

Listing 387.

Within `<surface>` elements, one may nest one or more `<graphic>` elements, each providing a reference to an image file that represents the writing surface. Multiple `<graphic>` elements are permitted in order to accommodate alternative versions (different resolutions or formats, for instance) of the surface image. In spite of changes in resolution or format, all images must contain the same content, i.e., the entire writing surface. A `<graphic>` may refer to a single page within a multi-page document, which is – at least for Adobe PDF documents – available through a `#page=X` suffix to the `target` attribute.

```

<facsimile>
  <surface>
    <graphic height="2000px" target="image1.jpg" width="3000px"/>
    <graphic height="1000px" target="image1smaller.jpg" width="1500px"/>
    <graphic height="200px" target="image1smallest.png" width="300px"/>
  </surface>
</facsimile>
<facsimile>
  <surface>
    <graphic height="297mm" target="source1.pdf#page=1" width="210mm"/>
  </surface>
  <surface>
    <graphic height="297mm" target="source1.pdf#page=2" width="210mm"/>
  </surface>
</facsimile>

```

Listing 388.

The preceding markup will provide the basis for most page-turning applications. Often, however, it is desirable to focus attention on particular areas of the graphical representation of the surface. The `<zone>` element fulfills this purpose:

```

<surface lrx="3000" lry="2000" ulx="0" uly="0">
  <graphic height="2000px" target="image1.jpg" width="3000px"/>
  <zone lrx="370" lry="410" ulx="300" uly="200"/>
  <zone lrx="439" lry="410" ulx="367" uly="200"/>
  <zone lrx="512" lry="410" ulx="436" uly="200"/>
</surface>

```

Listing 389.

The coordinates of each zone *define a space relative to the coordinate space of its parent surface*. Note that this is not necessarily the same coordinate space defined by the width and height attributes of the graphic that represents the surface. The zone coordinates in the preceding example do not represent regions within the graphic, but rather regions of the *writing surface*.

Because the coordinate space of a zone is defined relative to that of a surface, it is possible to provide multiple graphic elements *and* multiple zone elements within a single surface. In the following example, two different images representing the entire surface are provided alongside specification of two zones of interest within the surface:

```

<surface lrx="3000" lry="2000" ulx="0" uly="0">

```

```
<graphic height="2000px" target="image1.jpg" width="3000px"/>
<graphic height="1995px" target="image1cropped.jpg" width="2995px"/>
<zone lrx="370" lry="410" ulx="300" uly="200"/>
<zone lrx="30" lry="30" ulx="0" uly="0"/>
</surface>
```

Listing 390.

A `<zone>` element may contain `<figDesc>` or `<graphic>` elements that provide detailed descriptive information about the zone and additional images, e.g., at a different/higher resolution, of the rectangle defined by the zone. The data objects contained within the zone may also be specified through the use of the data attribute, which contains ID references to one more elements in the content tree of the MEI file, such as a `<note>`, `<measure>`, etc.

---

```
<!-- In the facsimile subtree: -->
<zone data="#facsimile.measure1" xml:id="facsimile.zone1"/>
<!-- somewhere in the content: -->
<measure xml:id="facsimile.measure1">
  <!-- measure content -->
</measure>
```

Listing 391.

Conversely, an element in the content may refer to the `<facsimile>` subtree using its `facs` attribute, which is made available by the `att.facsimile` attribute class. The last example could therefore be encoded with pointers in the other direction:

---

```
<!-- In the facsimile subtree: -->
<zone xml:id="facsimile.zone2"/>
<!-- somewhere in the content: -->
<measure facets="#facsimile.zone2" xml:id="facsimile.measure2">
  <!-- measure content -->
</measure>
```

Listing 392.

The `<pb>` element defined in the [2 Shared Concepts in MEI](#) makes special use of the `facs` attribute, in that it does not point to a `<zone>`, but a `<surface>` element instead. A `<pb>` marks the beginning of a page, so it can be concluded that all elements in the content tree which are encoded between any two `<pb>` elements encode musical symbols written on the page (`<surface>`) referenced by the first of these two `<pb>` element's `facs` attribute.

---

The encoding of `<facsimile>` elements is intended to support sequential display of page images. If an encoder wants to describe the physical setup of a source document, the `<foliaDesc>` element is more appropriate. The difference of both approaches, and how to combine them, is described in chapter [3.7.2 Description of folia](#).

DEVELOPMENT  
VERSION

## 12.2 Performances

This chapter describes the ‘performance’ module, which can be used for organizing audio and video files of performances of a musical work. The elements provided allow the encoder to group different recordings of the same performance, identify temporal segments within the recordings, and encode simple alignments with a music text.

### 12.2.1 Overview

The following elements are available to encode information about a recorded performance:

**<performance>** A presentation of one or more musical works.

**<recording>** A recorded performance.

**<avFile>** References an external digital audio or video file.

**<clip>** Defines a time segment of interest within a recording or within a digital audio or video file.

**<when>** Indicates a point in time either absolutely (using the absolute attribute), or relative to another when element (using the since, interval and inttype attributes).

The **<performance>** element begins a subtree of the **<music>** element and appears alongside with, or instead of, **<body>** (described in [2.1.2 General Music Structure Elements](#)) and **<facsimile>** (described in [12.1 Facsimiles](#)). A **<performance>** element represents one recorded performance event. As a performance may be recorded in multiple formats or by different personnel or using different equipment, the **<performance>** element may group one or more recordings of the event.

The **decls** attribute can be used to point to performance medium metadata for the performed work. See [3.6.7 Performance Medium](#) and [3.5 Functional Requirements for Bibliographic Records \(FRBR\)](#) for more details.

The **<recording>** element identifies a single recording event taking place within an absolute temporal space. The class **att.mediaBounds** contains attributes that can be used to define this space:

begin (att.mediaBounds)	Specifies a point where the relevant content begins. A numerical value must be less and a time value must be earlier than that given by the end attribute.
end (att.mediaBounds)	Specifies a point where the relevant content ends. If not specified, the end of the content is assumed to be the end point. A numerical value must be greater and a time value must be later than that given by the begin attribute.
betype (att.mediaBounds)	Type of values used in the begin/end attributes. The begin and end attributes can only be interpreted meaningfully in conjunction with this attribute.

The **<avFile>** element identifies an external file associated with a recording act. In the simplest case, the recording element will contain one **<avFile>** element identifying a file that represents it. The target attribute contains the URI of the digital media file. Use of the mimetype attribute is recommended for the **<avFile>** element. Its value should be a valid MIME media type defined by the Internet Engineering Task Force in RFC 2046. It is also recommended that all avFile elements have a recording or clip parent which bears the begin, end, and betype attributes.

```
<performance>
  <recording begin="00:00:00.00" betype="time" end="00:03:10.00">
    <avFile mimetype="audio/wav" target="http://example.com/path/to/audio/recording"/>
  </recording>
</performance>
```

Listing 393.

Sometimes, multiple digital files are created in order to provide greater flexibility in redistribution and playback capabilities. In this case, multiple `avFile` elements may occur, each with a different `mimetype`. Keep in mind, however, that each file still represents the complete temporal extent of the recording act in spite of the change of file format:

```
<performance>
  <recording begin="00:00:00.00" betype="time" end="00:03:10.00">
    <avFile mimetype="audio/wav" target="http://example.com/path/to/audio/recording/wav"/>
    <avFile mimetype="audio/mpeg" target="http://example.com/path/to/audio/recording/mpeg"/>
  </recording>
</performance>
```

Listing 394.

The `<clip>` element identifies a temporal segment of a recording act. In the following example, the clip begins two minutes into the timeframe of the recording and ends 20 seconds later:

```
<recording begin="00:00:00.00" betype="time" end="00:03:10.00">
  <clip begin="00:02:00.00" betype="time" end="00:20:20.00"/>
</recording>
```

Listing 395.

Beyond these relatively simple uses, complex situations may occur that require equally complex markup. For example, a single performance may be represented by multiple digital media files. Because they have differing durations, the media files must be the result of separate recording acts, even if these recording acts took place at the same time:

```
<performance>
  <recording begin="00:00:00.00" betype="time" end="00:03:10.00">
    <avFile mimetype="audio/wav" target="http://example.com/path/to/audio/recording/wav"/>
  </recording>
```

```
<recording begin="00:00:00.00" betype="time" end="00:03:15.00">
  <avFile mimetype="audio/mpeg" target="http://example.com/path/to/audio/recording/mpg"/>
</recording>
</performance>
```

Listing 396.

A single performance may also be represented by multiple, *sequential* digital files, as when a complete work is recorded in several so-called ‘takes’. In this case, the files may be considered to be parts of a single recording act, the extent of which is the combined extent of the individual clips. For example, a series of `<clip>` elements may be used to identify each movement of a piece and give start and end times for the movements in relation to the overall temporal space of the complete work:

---

```
<performance>
  <recording>
    <clip begin="00:00:00.00" betype="time" end="00:07:00.00" n="mov1">
      <avFile mimetype="audio/aiff" target="movement01.aiff"/>
    </clip>
    <clip begin="00:07:01.00" betype="time" end="00:12:03.00" n="mov2">
      <avFile mimetype="audio/aiff" target="movement02.aiff"/>
    </clip>
  </recording>
</performance>
```

Listing 397.

Similar markup is also applicable when a single file representing the entirety of a recording act is broken into segments later, as is often done for practical storage and distribution reasons. The file from which the clips are derived is indicated using an `avFile` element:

---

```
<performance>
  <recording begin="00:00:00.00" betype="time" end="00:12:03.00" n="completeWork">
    <avFile mimetype="audio/aiff" target="completeWork.aiff"/>
    <clip begin="00:00:00.00" betype="time" end="00:07:00.00" n="mov1">
      <avFile mimetype="audio/aiff" target="movement01.aiff"/>
    </clip>
    <clip begin="00:07:02.00" betype="time" end="00:12:03.00" n="mov2">
      <avFile mimetype="audio/aiff" target="movement02.aiff"/>
    </clip>
  </recording>
</performance>
```

Listing 398.

A `<clip>` may be used to define any region of interest, such as a cadenza or a modulation, a song verse, etc. The following example shows the use of `<clip>` and its attributes to identify significant sections of a recording:

```
<performance>
  <recording begin="00:00:00.00" betype="time" end="00:05:21.00">
    <!-- Exposition -->
    <clip begin="00:00:00.00" betype="time" end="00:01:41.00"/>
    <!-- Development -->
    <clip begin="00:01:41.00" betype="time" end="00:03:14.00"/>
    <!-- Recapitulation -->
    <clip begin="00:03:14.00" betype="time" end="00:04:28.00"/>
    <!-- Coda -->
    <clip begin="00:04:28.00" betype="time" end="00:05:21.00"/>
  </recording>
</performance>
```

Listing 399.

The preceding example also demonstrates that media files are not required in order to define the temporal space of a recording act or clip. This makes it possible to set the boundaries of these features, then use the content of the performance element as a rudimentary "edit decision list" to create the matching digital files.

If an encoding of the notated text with which the media files are associated is included in the MEI file, the startid attribute can be used to indicate the first element in the sequence of events to which the recording corresponds:

```
<performance>
  <recording begin="00:00:00.00" betype="time" end="00:07:00.00" n="mov1"
    startid="#performance.m1_1">
    <avFile mimetype="audio/aiff" target="fullpiece.aiff"/>
  </recording>
</performance>
<!-- ... -->
<body>
  <mdiv>
    <score>
      <section>
        <measure n="1" xml:id="performance.m1_1">
          <!-- ... -->
        </measure>
      </section>
    </score>
  </mdiv>
</body>
```

Listing 400.

Clips can also be aligned with components of the musical text encoded in the `<body>`. The startid attribute can be used to specify the starting element in the sequence of events to which the clip corresponds. The following example shows the use of clip elements to identify the exposition of the first movement from Beethoven's piano sonata Op. 14, no. 2 and its concluding 'codetta'.

---

```
<performance>
  <recording begin="00:00:00.00" betype="time" end="00:05:21.00">
    <avFile mimetype="audio/aiff" target="BeethovenOp14N2-Mov1.aiff"/>
    <!-- Exposition -->
    <clip begin="00:00:0.00" betype="time" end="00:01:41.00" startid="#performance.m1"/>
    <!-- Exposition's "codetta" -->
    <clip begin="00:01:31.00" betype="time" end="00:01:41.00" startid="#performance.m48"/>
  </recording>
</performance>
<!-- ... -->
<body>
  <mdiv>
    <score>
      <section>
        <measure n="1" xml:id="performance.m1">
          <!-- ... -->
        </measure>
        <!-- ... -->
        <measure n="48" xml:id="performance.m48">
          <!-- ... -->
        </measure>
      </section>
    </score>
  </mdiv>
</body>
```

---

Listing 401.

---

Please note that the begin and end times of clips may overlap. In the preceding example, the extent of the codetta is contained within that of the exposition. Overlapping beginning and ending points may also be used to provide additional performance context for a segment or because there is uncertainty with regard to precise values for these points.

---

```
<performance>
  <recording begin="00:00:00.00" betype="time" end="00:03:06.54">
    <!-- a section of interest -->
    <clip begin="00:00:00.00" betype="time" end="00:00:41.00"/>
    <!-- the following section starts a little before the end of the previous one to give some
        "adjustment" time -->
    <clip begin="00:00:31.00" betype="time" end="00:01:07.00"/>
    <!-- the boundaries of the following section are "fuzzy" -->
```

```

<clip begin="00:02:18.00" betype="time" end="00:02:49.85"/>
</recording>
</performance>
```

Listing 402.

A bibliographic description of a recording or metadata explaining how clip boundaries were determined may be associated with the recording and clip elements via the decls attribute:

```

<performance>
  <recording begin="00:00:00.00" betype="time" decls="#performance.recBibDesc"
    end="00:03:06.54">
    <!-- a section of interest -->
    <clip begin="00:00:00.00" betype="time" end="00:00:41.00"/>
    <!-- the following section starts a little before the end of the previous one to give some
      "adjustment" time -->
    <clip begin="00:00:31.00" betype="time" decls="#performance.clipDesc" end="00:01:07.00"/>
    <!-- the boundaries of the following section are "fuzzy" -->
    <clip begin="00:02:18.00" betype="time" end="00:02:49.85"/>
  </recording>
</performance>
```

Listing 403.

Associations between a feature of the encoding, such as a note, dynamic mark, or annotation, and a time point, may be created using `<when>` elements and when attributes.

The `<when>` element identifies a particular point in time during the playback of a media file, such as an audio recording.

```
<when absolute="00:00:01.915291666" abstype="time" xml:id="t1"/>
```

Listing 404.

Time points may be identified in absolute terms as above; that is, in hours, minutes, and seconds since the beginning of the recording, or in relative terms using the interval, inttype, and since attributes. In the following example, the time point of interest happens 48 frames after the occurrence of the point labelled as "t1".

```
<when interval="48" inttype="smpte-ndf29.97" since="#t1" xml:id="t1.1"/>
```

Listing 405.

Having identified a point of interest, another feature of the encoding may be associated with this point using its `when` attribute:

---

```
<annot resp="#LvB" when="#t1">
  <p>I like this part!</p>
</annot>
```

Listing 406.

---

One use of the association created between the annotation and the time point is to display the text of the annotation as the recording or clip is played.

The `when` attributes allows only a single value, so only one-to-one relationships can be created using this mechanism. However, one-to-many relationships are accommodated in the opposite direction; that is, from a time point to other features of the markup. For example,

---

```
<when xml:id="t1.2" absolute="00:00:01.915291666" abstype="time" data="#feature1 #feature2
#feature3"/>
```

Listing 407.

---

indicates that the entities identified in `data` all occur at the same instant.

`<extData>` is a container for holding non-MEI data formats, similar to `<extMeta>` but available in `<when>` rather than in `<meiHead>`. `<extData>` allows for data from audio or other sources to be linked to notes or other score events. Data should be enclosed in a CDATA tag.

The following example shows JSON formatted performance data encoded with `<extMeta>` for a single note (presumed to be defined elsewhere in the document as with the ID "note\_1"). Both single-value summaries (e.g., pitch) and time series values (e.g., contF0) are encoded.

---

```
<when absolute="00:00:00.00" xml:id="when_1" data="#note_1">
  <extData> <![CDATA[ {"offset": "00:00:02.9005", "pitch": "455.98", "contF0": [454.3737606,
  454.7165531, 455.2337513, 455.4622624, 456.0605954]} ]]> </extData>
</when>
```

Listing 408.

---

# 13 Linking Data

This chapter describes the use of elements in MEI for linking and referencing. This includes the elements, models, and attributes that are part of the 'MEI.ptrref' module. This module contains declarations, techniques and approaches to establish references within a single MEI document, or to link out from one MEI document to another or to other external sources. This chapter also addresses possibilities to link into an MEI document from external sources which makes MEI highly interoperable and serviceable in the context of Linked (Open) Data approaches.

## 13.1 Links

An element is a 'link' when it has an attribute whose value is a reference to the ID of one or more other elements (cross-reference). These link elements indicate an association between themselves (or one of their ancestors) and one or more other entities, either inside the same document or elsewhere. An association between two elements in the same document is said to be an 'internal' link, while an association that involves an entity outside the current document is called an 'external' link. However, either of the elements discussed in the following section can be used for either purpose.

## 13.2 Linking from MEI

This section describes techniques and approaches to establish references within a single MEI document, or to link out from one MEI document to another or to other external sources.

### 13.2.1 Pointers and References

The link elements discussed in this section are the `<ptr>` and the `<ref>` elements which are declared in the `MEI.ptrref` module.

**<ptr>** Defines a traversible pointer to another location, using only attributes to describe the destination.

**<ref>** Defines a traversible reference to another location. May contain text and sub-elements that describe the destination.

The `<ptr>` element is a traversible pointer to another location. It is an empty linking element that uses only attributes to describe its link destination. It cannot contain text or sub-elements to describe the referenced object. The next example shows the use of the `<ptr>` element to target a certain identifier (here e.g., a page number, or more precisely, page break elements, `<pb>`, bearing these identifiers) from within a `<list>` of item descriptions:

---

```
<list>
  <li>
    <!-- item description -->
    <ptr target="#p123"/>
  </li>
  <li>
    <!-- item description -->
    <ptr target="#p124"/>
  </li>
</list>
```

---

Listing 409.

---

The `<ref>` element defines a traversible reference to another location. While `<ptr>` cannot contain other markup, the `<ref>` element can include text or sub-elements that further specify the link destination:

---

```
<repository>
  <ref target="http://path.to.target/repo1.xml">
    <title>...</title>
    <address>
      <addrLine>...</addrLine>
    </address>
    <identifier>...</identifier>
  </ref>
```

```
</repository>
```

Listing 410.

### 13.2.2 Specifying Link Elements

The `<ptr>` and `<ref>` elements share a set of common attributes that are inherited from the `att.pointing` class (a more detailed explanation is provided below):

<code>target (att.pointing)</code>	Identifies passive participants in a relationship; that is, the entities pointed "to".
<code>targettype (att.pointing)</code>	Characterization of target resource(s) using any convenient classification scheme or typology.
<code>xlink:actuate (att.pointing)</code>	Defines whether a link occurs automatically or must be requested by the user.
<code>xlink:show (att.pointing)</code>	Defines how a remote resource is rendered.
<code>xlink:role (att.pointing)</code>	Characterization of the relationship between resources. The value of the role attribute must be a URI.

In addition to the attributes in the `att.pointing` class, the `mimetype` attribute from the `att.internetMedia` class is also available on `<ptr>` and `<ref>` (a more detailed explanation is provided below):

<code>mimetype (att.internetMedia)</code>	Specifies the applicable MIME (multimedia internet mail extension) type. The value should be a valid MIME media type defined by the Internet Engineering Task Force in RFC 2046.
-------------------------------------------	----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

The `att.linking` class provides another set of common attributes (a more detailed explanation is provided in [10 Analysis Markup and Harmonies: 10.1.1 General Relationships Between Elements](#)):

<code>copyof (att.linking)</code>	Points to an element of which the current element is a copy.
<code>corresp (att.linking)</code>	Used to point to other elements that correspond to this one in a generic fashion.
<code>follows (att.linking)</code>	points to one or more events in a user-defined collection that are known to be predecessors of the current element.
<code>next (att.linking)</code>	Used to point to the next event(s) in a user-defined collection.
<code>precedes (att.linking)</code>	Points to one or more events in a user-defined collection that are known to be successors of the current element.
<code>prev (att.linking)</code>	Points to the previous event(s) in a user-defined collection.
<code>sameas (att.linking)</code>	Points to an element that is the same as the current element but is not a literal copy of the current element.
<code>synch (att.linking)</code>	Points to elements that are synchronous with the current element.

Additionally, the following attributes are also available on `<ptr>` and `<ref>`:

Via the `att.metadataPointing` class:

**decls** **(att.metadataPointing)** Identifies one or more metadata elements (other than classification terms) within the header, which are understood to apply to the element bearing this attribute and its content.

Via the `att.classed` class:

**class** Contains one or more URIs which denote classification terms that apply to the entity bearing this attribute.  
**(att.classed)**

Via the `att.responsibility` class:

**resp** Indicates the agent(s) responsible for some aspect of the text's transcription, editing, or  
**(att.responsibility)** encoding. Its value must point to one or more identifiers declared in the document header.

### 13.2.2.1 Define the link element's target (XPointer mechanism)

The target attribute specifies the destination of a pointer or reference using a method standardized by the W3C consortium, known as the XPointer mechanism. The XPointer framework is described at <http://www.w3.org/TR/xptr-framework/>. This mechanism permits a range of complexity, from the very simple (a reference to the value of the target element's `xml:id` attribute) to the more complex usage of a full URI with embedded XPointers:

```
<!-- element ID -->  
<ptr target="#SA" />
```

### Listing 411.

```
<!-- relative URL -->  
<ptr target="myFile.xml"/>
```

### Listing 412.

```
<!-- absolute URL -->  
<xptr target="http://www.w3.org/TR/xptr-framework/" />
```

### Listing 413.

```
<!-- URL with fragment identifier -->
<ptr target="http://www.w3.org/TR/xptr-xpointer/#xpointer(id('chum')/quote)"/>
```

Listing 414.

```
<!-- URN -->
<ref target="urn:isbn:0000-0000-9E59-0000-0-0000-0000-2">Spider-Man</ref>
```

Listing 415.

A target attribute is not required in order to mark the textual content as a cross-reference, as demonstrated in the example below; however, without this attribute the reference will not be resolvable.

```
<p>See
<ref>Hankinson, Roland, Fujinaga (2011)</ref>
.</p>
```

Listing 416.

### 13.2.2.2 Define the type of a link element's target

The targettype attribute allows the target resource to be characterized using any convenient classification scheme or typology. This is often useful when the target requires special processing, e.g., for display purposes. The pointers in the examples below may be formatted differently, e.g., the bibliographic citation may result in special typography while the pointer to the audio file may be used to embed an audio player:

```
<ptr target="#cit1" targettype="biblioCitation"/>
```

Listing 417.

```
<ptr target="http://path.to.resource/myAudio.aiff" targettype="audioClip"/>
```

Listing 418.

### 13.2.2.3 Define the mimetype of a link element's target

The function of the mimetype attribute is similar to that of targettype in that they both allow classification of the destination. Unlike targettype, however, mimetype explicitly defines the destination type using a standard taxonomy. Its value should be a valid MIME (Multimedia Internet Mail Extension) type as defined by the Internet Engineering Task Force (IETF) in RFC 2046, available at <http://www.ietf.org/rfc/rfc2046.txt>. The following are all valid mimetype values:

---

```
<ptr mimetype="application/pdf" target="my.pdf"/>
<ptr mimetype="text/xml" target="my.xml"/>
<ptr mimetype="image/png" target="my.png"/>
```

Listing 419.

---

As shown above, the `<ptr>` element can be used to 'point to' a digital image (`target="my.png"`). However, when the intention is to *display* a digital image as part of the rendering of an MEI file, the `<graphic>` element provides a convenient and recommended alternative:

---

```
<graphic mimetype="image/png" target="my.png"/>
```

Listing 420.

---

The mimetype attribute is particularly useful for documenting the nature of the destination when the value of target does not provide a filename extension or when the destination is a non-standard file type:

---

```
<ptr mimetype="application/pdf" target="myFile1"/>
<ptr mimetype="application/x-myApplicationSpecificFile" target="myFile2"/>
```

Listing 421.

---

### 13.2.2.4 Determine the link element's behaviour

The xlink:actuate and xlink:show attributes are used in conjunction to determine the link's behavior.

The xlink:actuate attribute defines whether the resolution of a link occurs automatically or must be requested by the user.

The following values are allowed for the xlink:actuate attribute:

**'onLoad'** load the target resource(s) immediately

**'onRequest'** load the target resource(s) upon user request, e.g., after a mouse click

**'none'** do not permit loading of the target resource(s); no other markup is provided to determine appropriate behavior

**'other'** behavior other than permitted by the other values of this attribute; application should look for other markup to determine appropriate behavior

The value "none" may be used to indicate that the link is un-traversable and no other markup is provided to determine appropriate behavior; it may or may not render the link invisible to the user. When the value of xlink:actuate is "other", an application must base a determination of appropriate behavior on factors other than the value of xlink:actuate.

The xlink:show attribute defines how a remote resource is to be rendered. The following values are permitted:

**'new'** target of the link appears in a new window

**'replace'** target of the link replaces the current resource in the same window

**'embed'** the content of the target appears at the point of the link

**'none'** do not permit traversal to the target resource(s); no other markup is provided to determine appropriate behavior

**'other'** behavior other than permitted by the other values of this attribute; application should look for other markup to determine appropriate behavior

The value "none" may be used to indicate a link that is not displayed or is not displayable and no other markup is provided to determine appropriate behavior. When the value of xlink:show is "other", an application must base a determination of appropriate behavior on factors other than the value of xlink:show.

The following example illustrates a pointer that results in the automatic creation of a new window with the content of the target loaded in it:

```
<ptr mimetype="text" target="http://www.ietf.org/rfc/rfc2046.txt" xlink:actuate="onLoad"
xlink:show="new"/>
```

Listing 422.

### 13.2.2.5 Determine the link element's role

The xlink:role attribute describes the meaning of resources within the context of a link. It is used to label or describe a link or resource in a human- and machine-readable fashion. The value of xlink:role must be an absolute URI (Uniform Resource Identifier) reference as defined by the Internet Engineering Task Force (IETF) in RFC 3986, available at <http://tools.ietf.org/html/rfc3986>. The URI reference identifies a resource that describes the intended property. When no value is supplied, no particular role value is to be inferred.

```
<ptr target="joe.xml" xlink:role="http://www.example.com/linkprops/student"/>
```

Listing 423.

---

```
<ptr target="joe.xml" xlink:role="http://www.example.com/linkprops/instructor"/>
```

Listing 424.

---

In the preceding examples, the value of the `xlink:role` attribute may be used to specify the value of the link target's role.

## 13.3 Linking and Alignment

The linkAlign module has been deprecated in MEI v3.

DEVELOPMENT  
VERSION

DEVELOPMENT  
VERSION

# 14 Integrating MEI with other Standards and Formats

In this chapter, the combination of MEI with other relevant formats in the field is covered. Here, the MEI Guidelines try to serve as Best Practice Recommendations; they don't claim to provide full and / or authoritative documentation for those other formats. The intention is to provide good starting points and share experience across various projects, trying to unify both tools and workflows for better efficiency. Accordingly, if the information found here provides as outdated or incomplete, please [get in touch](#).

## 14.1 TEI

The TEI's Special Interest Group on Music has come up with an ODD customization for TEI, which allows to embed MEI excerpts into TEI. However, the SIG Music is officially considered *dormant*, so the information provided is somewhat outdated. The most recent resources are available from [GitHub](#).

As of yet, no official MEI customization to include elements from the TEI namespace into MEI has been written, even though this is definitely wanted.

## 14.2 IIIF

This chapter will explain how to use MEI in an IIIF-compatible way.

DEVELOPMENT  
VERSION

## 14.3 SMuFL

This section describes how to use MEI with the Standard Music Font Layout (SMuFL, <https://www.smufl.org/>) specification.

DEVELOPMENT  
VERSION

## 14.4 SVG

In order to use Scalable Vector Graphics (SVG) in MEI, a new *module* needs to be compiled into ODD (see 1.2.5 *Customizing MEI* for an introduction on how to do that). In order to do that, you need to enter the following `<tei:moduleRef>` into the `<tei:schemaSpec>` of your ODD file:

---

```
<moduleRef url="http://www.w3.org/Graphics/SVG/1.1/rng/svg11.rng">
  <content>
    <rng:define name="mei_model.graphicLike" combine="choice"> <rng:ref name="svg"></rng:ref>
    </rng:define>
  </content>
</moduleRef>
```

Listing 425.

---

With this addition, which can be added to any of the provided customizations of MEI (see 1.2.4 *MEI Profiles*), the `<svg>` element becomes available everywhere `model.graphicLike` (i.e., the `<graphic>` element) is currently allowed, that is: inside of `<fig>`, `<incip>`, `<surface>`, and `<zone>`.

In the following example, an `<svg:path>` element is inserted into a `<surface>`. It would now be possible for measures or other music features to point to the rectangular `<zone>` in MEI namespace, or the fancy shaped `<svg:path>` using their `facs` attribute (see 12.1.1 *Elements of the Facsimile Module* for that mechanism). It's equally possible to use SVG content inside figures on title pages or anywhere else.

---

```
<surface lrx="3000" lry="2000" ulx="0" uly="0"> <graphic target="image1.jpg" width="3000px"
height="2000px"></graphic>
  <zone xml:id="rectangle" lrx="370" lry="410" ulx="300" uly="200"/>
  <svg:svg version="1.1" width="3000px" height="2000px" viewBox="0 0 3000 2000">
    <svg:path id="fancyShape" fill="#ff0000" d="..."/>
  </svg:svg>
</surface>
```

Listing 426.

---

Of course it's possible to allow elements in SVG namespace in other places in MEI as well, by adjusting the model classes that the SVG namespace shall join.

## 14.5 Musical Instrument Digital Interface (MIDI)

This chapter describes the MIDI encoding functionality present in MEI. The purpose of this module is to allow for integrating MIDI data into MEI-encoded notation, to both aid software in translating MEI to MIDI, and to permit the capture of information in files that have been translated from MIDI to MEI. The MIDI model in MEI is similar to that of Mup, and the user is directed to the [Mup User Guide](#) for further reading.

The MIDI module defines certain generally-accepted MIDI units that may be used outside of a MIDI context. For example, the dur.ppq attribute accepts MIDI *ppq* (Pulses Per Quarter) as a valid measurement of duration. Similarly, the pnum attribute allows MIDI note numbers for specifying a pitch value.

### 14.5.1 PPQ in scoreDef and staffDef

To define the MIDI resolution of a score, the ppq attribute may be used on the `<scoreDef>` element. This value can be used to interpret the values found in the dur.ppq attribute on elements in the `att.duration.ges` class.

```
<scoreDef keysig="1f" meter.count="4" meter.sym="common" meter.unit="4" ppq="48">
  <staffGrp>
    <staffDef clef.line="2" clef.shape="G" keysig="1f" lines="5" n="1" xml:id="midi.P1"/>
    <staffDef clef.line="4" clef.shape="F" keysig="1f" lines="5" n="2" xml:id="midi.P2"/>
    <staffDef clef.line="4" clef.shape="F" keysig="1f" lines="5" n="3" xml:id="midi.P3"/>
  </staffGrp>
</scoreDef>

<note dur="8" dur.ges="24p" oct="5" pname="a" stem.dir="up" xml:id="midi.d1e40"/>

<rest dur="32" dur.ges="6p" vo="4" xml:id="midi.d1e58"/>

<!-- snip --&gt;</pre>

```

Listing 427.

The ppq attribute is also available on the `<staffDef>` element in order to aid in the conversion to MEI from other representations that allow a different time base for each staff. However, these independent values for ppq are only interpretable in terms of a common time base. Therefore, the ppq attribute is required on `<scoreDef>` when the values of ppq on the staff definitions differ. In the following example, the values of the ppq attributes on the `<staffDef>` elements are all factors of the value of ppq attached to `<scoreDef>`.

```
<scoreDef keysig="1f" meter.count="4" meter.sym="common" meter.unit="4" ppq="48">
  <staffGrp>
    <staffDef clef.line="2" clef.shape="G" keysig="1f" lines="5" n="1" ppq="2" xml:id="midi.P1"/>
    <staffDef clef.line="4" clef.shape="F" keysig="1f" lines="5" n="2" ppq="16"
      xml:id="midi.P2"/>
```

```
<staffDef clef.line="4" clef.shape="F" keysig="1f" lines="5" n="3" ppq="24"
  xml:id="midi.P3"/>
</staffGrp>
</scoreDef>
```

Listing 428.

---

### 14.5.2 Recording General MIDI Instrumentation

The `<instrDef>` element can be used to record MIDI instrument names or numbers using the `midi.instrname` and `midi.instrnum` attributes. The `midi.instrname` attribute must contain an instrument name from the list provided by the `data.MIDINAMES` data type. By default, `data.MIDINAMES` contains General MIDI Instrument designations.

---

```
<scoreDef keysig="1f" meter.count="4" meter.sym="common" meter.unit="4" ppq="48">
  <staffGrp>
    <staffDef clef.line="2" clef.shape="G" lines="5" n="1" xml:id="midi.P5">
      <instrDef midi.instrname="Violin"/>
    </staffDef>
    <staffDef clef.line="2" clef.shape="G" lines="5" n="2" xml:id="midi.P6">
      <instrDef midi.instrname="Violin"/>
    </staffDef>
    <staffDef clef.line="3" clef.shape="C" lines="5" n="3" xml:id="midi.P7">
      <instrDef midi.instrname="Viola"/>
    </staffDef>
    <staffDef clef.line="4" clef.shape="F" lines="5" n="3" xml:id="midi.P8">
      <instrDef midi.instrname="Cello"/>
    </staffDef>
  </staffGrp>
</scoreDef>
```

Listing 429.

---

The `midi.instrnum` is provided for those cases when an instrument number is needed. It must contain valid MIDI values; that is, 0-127. In these cases, a General MIDI Instrument name is redundant.

---

```
<scoreDef keysig="1f" meter.count="4" meter.sym="common" meter.unit="4" ppq="48">
  <staffGrp>
    <staffDef clef.line="2" clef.shape="G" lines="5" n="1" xml:id="midi.P5">
      <instrDef midi.instrnum="41"/>
    </staffDef>
    <staffDef clef.line="2" clef.shape="G" lines="5" n="2" xml:id="midi.P6">
      <instrDef midi.instrnum="41"/>
    </staffDef>
    <staffDef clef.line="3" clef.shape="C" lines="5" n="3" xml:id="midi.P7">
```

```

<instrDef midi.instrnum="42"/>
</staffDef>
<staffDef clef.line="4" clef.shape="F" lines="5" n="3" xml:id="midi.P8">
  <instrDef midi.instrnum="43"/>
</staffDef>
</staffGrp>
</scoreDef>

```

Listing 430.

### 14.5.3 Recording MIDI Event Data

MIDI messages are encapsulated in the `<midi>` element, which is typically used in contexts like `<layer>` and `<measure>`. In earlier versions of MEI, the `<noteOn>` and `<noteOff>` elements were used to record MIDI note on/off events. The use of these elements is now discouraged in favor of using the `<note>` element directly. MIDI duration should be recorded using the `dur.ges` attribute, and MIDI pitch information should be recorded using the `pnum` attribute.

MIDI control changes (`<cc>`) are encoded using the `num` and `val` attributes. Control change numbers are specified in the General MIDI documentation. In the example below, the `<cc>` elements encode increasing controller event 7 (volume) values, or in musical terms, a crescendo. Other MIDI event messages follow this same pattern, using the `num` and `val` attributes to record the raw MIDI data.

```

<measure>
  <staff>
    <layer>
      <note dur.ges="8" pnum="45"/>
      <note dur.ges="8" pnum="42"/>
      <note dur.ges="8" pnum="43"/>
      <note dur.ges="8" pnum="44"/>
    </layer>
  </staff>
  <midi layer="1" staff="1">
    <cc num="7" tstamp=".5" val="50"/>
    <cc num="7" tstamp="1.5" val="55"/>
    <cc num="7" tstamp="2" val="60"/>
    <cc num="7" tstamp="2.5" val="65"/>
  </midi>
</measure>

```

Listing 431.

In the preceding example, each control change is associated with a time stamp. The `tstamp` attribute is required in order to indicate when the MIDI event should take place. It is often necessary to indicate a time stamp slightly earlier than the affected notes to compensate for MIDI delay.

For better legibility and error checking, the `<midi>` element may be used, as in the following example, to group MIDI parameter changes. Even so, the `tstamp` attribute is required on all parameters in order to associate them with their point of actuation:

```
<midi layer="1" staff="1">
  <cc num="7" tstamp=".5" val="50"/>
  <cc num="64" tstamp=".5" val="64"/>
</midi>
```

Listing 432.

---

#### 14.5.4 MIDI in Mensural and Neume Notation

In mensural, neume, and other historical or non-Western repertoires, there is often no measure-based time stamp with which to associate MIDI controller data. Therefore, in these notations MIDI controller data is assumed to be associated with the event that immediately follows in the same layer. Thus, a crescendo in mensural notation may be encoded like so:

```
<staff>
  <layer>
    <midi>
      <cc num="7" val="50"/>
    </midi>
    <note dur="fusa" dur.ges="8p" pnum="42"/>
    <midi>
      <cc num="7" val="55"/>
    </midi>
    <note dur="fusa" dur.ges="8p" pnum="43"/>
    <midi>
      <cc num="7" val="60"/>
    </midi>
    <note dur="fusa" dur.ges="8p" pnum="44"/>
    <midi>
      <cc num="7" val="65"/>
    </midi>
    <note dur="fusa" dur.ges="8p" pnum="45"/>
  </layer>
</staff>
```

Listing 433.

## MEI.analytical

Analytical component declarations.

### Elements in MEI.analytical

– no elements defined in MEI.analytical –

### Model Classes in MEI.analytical

– no model classes defined in MEI.analytical –

### Macro Groups in MEI.analytical

– no macro groups defined in MEI.analytical –

### Attribute Classes in MEI.analytical

att.accid.anl, att.ambitus.anl, att.ambNote.anl, att.anchoredText.anl, att.annot.anl, att.arpeg.anl, att.artic.anl, att.attacca.anl, att.barLine.anl, att.beam.anl, att.beamSpan.anl, att.beatRpt.anl, att.bend.anl, att.bracketSpan.anl, att.breath.anl, att.bTrem.anl, att.caesura.anl, att.chord.anl, att.chordDef.anl, att.chordMember.anl, att.clef.anl, att.clefGrp.anl, att.cpMark.anl, att.curve.anl, att.custos.anl, att.mdiv.anl, att.dir.anl, att.dot.anl, att.dynam.anl, att.ending.anl, att.episema.anl, att.f.anl, att.fermata.anl, att.fing.anl, att.fingGrp.anl, att.fTrem.anl, att.gliss.anl, att.grpSym.anl, att.hairpin.anl, att.halfmRpt.anl, att.harm.anl, att.graceGrp.anl, att.harmonicFunction, att.harpPedal.anl, att.hispanTick.anl, att.instrDef.anl, att.intervalHarmonic, att.intervalMelodic, att.keyAccid.anl, att.keySig.anl, att.keySigDefault.anl, att.layer.anl, att.layerDef.anl, att.ligature.anl, att.line.anl, att.liquescent.anl, att.lv.anl, att.lyrics.anl, att.measure.anl, att.melodicFunction, att.mensur.anl, att.metaMark.anl, att.meterSig.anl, att.meterSigGrp.anl, att.midi.anl, att.mNum.anl, att.mordent.anl, att.mRest.anl, att.mRpt.anl, att.mRpt2.anl, att.mSpace.anl, att.multiRest.anl, att.multiRpt.anl, att.nc.anl, att.ncGrp.anl, att.neume.anl, att.note.anl, att.octave.anl, att.ornam.anl, att.oriscus.anl, att.ossia.anl, att.pad.anl, att.part.anl, att.parts.anl, att.pb.anl, att.pedal.anl, att.phrase.anl, att.pitchClass, att.plica.anl, att.proport.anl, att.quilisma.anl, att.rdg.anl, att.refrain.anl, att.reh.anl, att.repeatMark.anl, att.rest.anl, att.sb.anl, att.score.anl, att.scoreDef.anl, att.section.anl, att.slur.anl, att.signifLet.anl, att.solfa, att.sp.anl, att.space.anl, att.staff.anl, att.staffDef.anl, att.staffGrp.anl, att.stageDir.anl, att.stem.anl, att.strophicus.anl, att.syl.anl, att.syllable.anl, att.symbol.anl, att.tempo.anl, att.tie.anl, att.trill.anl, att.tuplet.anl, att.tupletSpan.anl, att.turn.anl, att.verse.anl, att.volta.anl

### Data Types in MEI.analytical

– no data types defined in MEI.analytical –

## MEI.cmn

Common Music Notation (CMN) repertoire component declarations.

### Elements in MEI.cmn

<arpeg>, <attacca>, <beam>, <beamSpan>, <beatRpt>, <bend>, <bracketSpan>, <breath>, <bTrem>, <fermata>, <fTrem>, <gliss>, <graceGrp>, <hairpin>, <halfmRpt>, <harpPedal>, <lv>, <measure>, <meterSig>, <meterSigGrp>, <mNum>, <mRest>, <mRpt>, <mRpt2>, <mSpace>, <multiRest>, <multiRpt>, <octave>, <oLayer>, <ossia>, <oStaff>, <pedal>, <reh>, <repeatMark>, <slur>, <tie>, <tuplet>, <tupletSpan>

### Model Classes in MEI.cmn

model.controlEventLike.cmn, model.eventLike.cmn, model.eventLike.measureFilling, model.layerPart.cmn, model.measureLike, model.measurePart, model.ossiaLike, model.sectionPart.cmn

### Macro Groups in MEI.cmn

– no macro groups defined in MEI.cmn –

### Attribute Classes in MEI.cmn

att.arpeg.log, att.beam.log, att.beamedWith, att.beaming.log, att.beamPresent, att.beamRend, att.beamSecondary, att.beamSpan.log, att.beatRpt.log, att.bend.log, att.bracketSpan.log, att.breath.log, att.bTrem.log, att.chord.anl.cmn, att.chord.ges.cmn, att.chord.log.cmn, att.chord.vis.cmn, att.cutout, att.mNum.log, att.expandable, att.fermata.log, att.fTrem.log, att.glissPresent, att.gliss.log, att.graced, att.graceGrp.log, att.hairpin.log, att.halfmRpt.log, att.harpPedal.log, att.layerDef.log.cmn, att.lv.log, att.lvPresent, att.measure.log, att.meterSigGrp.log, att.mRest.log, att.mRpt.log, att.mRpt2.log, att.mSpace.log, att.multiRest.log, att.multiRpt.log, att.note.anl.cmn, att.note.log.cmn, att.note.vis.cmn, att.numbered, att.numberPlacement, att.octave.log, att.ossia.log, att.pedal.log, att.phrase.vis.cmn, att.pianoPedals, att.reh.log, att.rehearsal, att.rest.anl.cmn, att.rest.log.cmn, att.rest.vis.cmn, att.scoreDef.log.cmn, att.scoreDef.vis.cmn, att.slur.log, att.slurRend, att.space.anl.cmn, att.space.log.cmn, att.staffDef.log.cmn, att.staffDef.vis.cmn, att.stems.cmn, att.tie.log, att.tieRend, att.tremMeasured, att.tuplet.log, att.tupletSpan.log

### Data Types in MEI.cmn

data.DURATION.cmn, data.STAFFITEM.cmn

## MEI.cmnOrnaments

CMN ornament component declarations.

### Elements in MEI.cmnOrnaments

[`<mordent>`](#), [`<trill>`](#), [`<turn>`](#)

### Model Classes in MEI.cmnOrnaments

[model.ornamentLike.cmn](#)

### Macro Groups in MEI.cmnOrnaments

– no macro groups defined in MEI.cmnOrnaments –

### Attribute Classes in MEI.cmnOrnaments

[att.mordent.log](#), [att.ornamentAccid](#), [att.ornamPresent](#), [att.trill.log](#), [att.turn.log](#)

### Data Types in MEI.cmnOrnaments

[data.ORNAM.cmn](#)

## **MEI.corpus**

Corpus component declarations.

### **Elements in MEI.corpus**

[`<meiCorpus>`](#)

### **Model Classes in MEI.corpus**

`model.startLike.corpus`

### **Macro Groups in MEI.corpus**

– no macro groups defined in MEI.corpus –

### **Attribute Classes in MEI.corpus**

– no attribute classes defined in MEI.corpus –

### **Data Types in MEI.corpus**

– no data types defined in MEI.corpus –

## **MEI.critapp**

Critical apparatus component declarations.

### **Elements in MEI.critapp**

[<app>](#), [<lem>](#), [<rdg>](#)

### **Model Classes in MEI.critapp**

[model.appLike](#), [model.rdgPart](#), [model.rdgPart.music](#), [model.rdgPart.text](#)

### **Macro Groups in MEI.critapp**

– no macro groups defined in MEI.critapp –

### **Attribute Classes in MEI.critapp**

[att.crit](#), [att.rdg.log](#)

### **Data Types in MEI.critapp**

– no data types defined in MEI.critapp –

## **MEI.drama**

Dramatic text component declarations.

### **Elements in MEI.drama**

[`<sp>`](#), [`<stageDir>`](#)

### **Model Classes in MEI.drama**

[model.stageDirLike](#)

### **Macro Groups in MEI.drama**

– no macro groups defined in MEI.drama –

### **Attribute Classes in MEI.drama**

[att.sp.log](#), [att.stageDir.log](#)

### **Data Types in MEI.drama**

– no data types defined in MEI.drama –

## MEI.edittrans

Editorial and transcriptional component declarations.

### Elements in MEI.edittrans

`<abbr>, <add>, <choice>, <corr>, <cpMark>, <damage>, <del>, <expan>, <gap>, <handShift>, <metaMark>, <orig>, <reg>, <restore>, <sic>, <subst>, <supplied>, <unclear>`

### Model Classes in MEI.edittrans

`model.choicePart`, `model.editLike`, `model.editTransPart`, `model.editTransPart.music`, `model.editTransPart.text`,  
`model.transcriptionLike`

### Macro Groups in MEI.edittrans

– no macro groups defined in MEI.edittrans –

### Attribute Classes in MEI.edittrans

`att.agentIdent`, `att.cpMark.log`, `att.edit`, `att.metaMark.log`, `att.reasonIdent`, `att.trans`

### Data Types in MEI.edittrans

– no data types defined in MEI.edittrans –

## **MEI.externalsymbols**

External symbols component declarations.

### **Elements in MEI.externalsymbols**

- no elements defined in MEI.externalsymbols -

### **Model Classes in MEI.externalsymbols**

- no model classes defined in MEI.externalsymbols -

### **Macro Groups in MEI.externalsymbols**

- no macro groups defined in MEI.externalsymbols -

### **Attribute Classes in MEI.externalsymbols**

[att.extSym.auth](#), [att.extSym.names](#), [att.extSym](#)

### **Data Types in MEI.externalsymbols**

- no data types defined in MEI.externalsymbols -

## MEI.facsimile

Facsimile component declarations.

### Elements in MEI.facsimile

[`<facsimile>`](#), [`<surface>`](#), [`<zone>`](#)

### Model Classes in MEI.facsimile

– no model classes defined in MEI.facsimile –

### Macro Groups in MEI.facsimile

– no macro groups defined in MEI.facsimile –

### Attribute Classes in MEI.facsimile

[`att.facsimile`](#)

### Data Types in MEI.facsimile

– no data types defined in MEI.facsimile –

## **MEI.figtable**

Figures and tables component declarations.

### **Elements in MEI.figtable**

`<fig>`, `<figDesc>`, `<graphic>`, `<table>`, `<td>`, `<th>`, `<tr>`

### **Model Classes in MEI.figtable**

`model.figDescLike`, `model.figureLike`, `model.graphicLike`, `model.tableLike`

### **Macro Groups in MEI.figtable**

- no macro groups defined in MEI.figtable -

### **Attribute Classes in MEI.figtable**

`att.tabular`

### **Data Types in MEI.figtable**

- no data types defined in MEI.figtable -

## MEI.fingering

Fingering component declarations.

### Elements in MEI.fingering

[`<fing>`](#), [`<fingGrp>`](#)

### Model Classes in MEI.fingering

[model.fingeringLike](#)

### Macro Groups in MEI.fingering

– no macro groups defined in MEI.fingering –

### Attribute Classes in MEI.fingering

[att.fing.log](#), [att.fingGrp.log](#)

### Data Types in MEI.fingering

– no data types defined in MEI.fingering –

## **MEI.frbr**

FRBR (Functional Requirements for Bibliographic Records) declarations.

### **Elements in MEI.frbr**

[`<expression>`](#), [`<expressionList>`](#), [`<item>`](#), [`<itemList>`](#), [`<manifestation>`](#), [`<manifestationList>`](#)

### **Model Classes in MEI.frbr**

`model.expressionLike`, `model.itemLike`, `model.manifestationLike`

### **Macro Groups in MEI.frbr**

- no macro groups defined in MEI.frbr -

### **Attribute Classes in MEI.frbr**

- no attribute classes defined in MEI.frbr -

### **Data Types in MEI.frbr**

`data.FRBRRELATIONSHIP`

## MEI.genetic

Genetic encoding component declarations.

### Elements in MEI.genetic

[`<genDesc>`](#), [`<genState>`](#)

### Model Classes in MEI.genetic

– no model classes defined in MEI.genetic –

### Macro Groups in MEI.genetic

– no macro groups defined in MEI.genetic –

### Attribute Classes in MEI.genetic

[`att.geneticState`](#)

### Data Types in MEI.genetic

– no data types defined in MEI.genetic –

## MEI.gestural

Gestural component declarations.

### Elements in MEI.gestural

- no elements defined in MEI.gestural –

### Model Classes in MEI.gestural

- no model classes defined in MEI.gestural –

### Macro Groups in MEI.gestural

- no macro groups defined in MEI.gestural –

### Attribute Classes in MEI.gestural

att.accid.ges, att.accidental.ges, att.ambitus.ges, att.ambNote.ges, att.anchoredText.ges, att.annot.ges, att.arpeg.ges, att.artic.ges, att.articulation.ges, att.attacca.ges, att.barLine.ges, att.beam.ges, att.beamSpan.ges, att.beatRpt.ges, att.bend.ges, att.bracketSpan.ges, att.breath.ges, att.bTrem.ges, att.caesura.ges, att.chord.ges, att.chordDef.ges, att.chordMember.ges, att.clef.ges, att.clefGrp.ges, att.cpMark.ges, att.curve.ges, att.custos.ges, att.mdiv.ges, att.dir.ges, att.dot.ges, att.duration.ges, att.dynam.ges, att.ending.ges, att.episema.ges, att.f.ges, att.fermata.ges, att.fing.ges, att.fingGrp.ges, att.fTrem.ges, att.gliss.ges, att.graceGrp.ges, att.grpSym.ges, att.hairpin.ges, att.halfmRpt.ges, att.harm.ges, att.harpPedal.ges, att.hispanTick.ges, att.instrDef.ges, att.keyAccid.ges, att.keySig.ges, att.layer.ges, att.layerDef.ges, att.ligature.ges, att.line.ges, att.liquescent.ges, att.lv.ges, att.lyrics.ges, att.measure.ges, att.mensur.ges, att.metaMark.ges, att.meterSig.ges, att.meterSigGrp.ges, att.midi.ges, att.mNum.ges, att.mordent.ges, att.mRest.ges, att.mRpt.ges, att.mRpt2.ges, att.mSpace.ges, att.multiRest.ges, att.multiRpt.ges, att.nc.ges, att.ncGrp.ges, att.neume.ges, att.note.ges, att.octave.ges, att.oriscus.ges, att.ornam.ges, att.ornamentAccid.ges, att.ossia.ges, att.pad.ges, att.part.ges, att.parts.ges, att.pb.ges, att.pedal.ges, att.phrase.ges, att.plica.ges, att.proport.ges, att.quilisma.ges, att.rdg.ges, att.refrain.ges, att.reh.ges, att.repeatMark.ges, att.rest.ges, att.sb.ges, att.score.ges, att.scoreDef.ges, att.section.ges, att.signifLet.ges, att.slur.ges, att.soundLocation, att.sp.ges, att.space.ges, att.staff.ges, att.staffDef.ges, att.staffGrp.ges, att.stageDir.ges, att.stem.ges, att.strophicus.ges, att.syl.ges, att.syllable.ges, att.symbol.ges, att.tempo.ges, att.tie.ges, att.timestamp.ges, att.timestamp2.ges, att.trill.ges, att.tuplet.ges, att.tupletSpan.ges, att.turn.ges, att.verse.ges, att.volta.ges

### Data Types in MEI.gestural

- no data types defined in MEI.gestural –

## MEI.harmony

Harmony component declarations.

### Elements in MEI.harmony

[`<chordDef>`](#), [`<chordMember>`](#), [`<chordTable>`](#), [`<f>`](#), [`<fb>`](#), [`<harm>`](#)

### Model Classes in MEI.harmony

[model.chordTableLike](#), [model.controlEventLike.harmony](#), [model.figbassLike](#), [model.fLike](#), [model.harmLike](#)

### Macro Groups in MEI.harmony

– no macro groups defined in MEI.harmony –

### Attribute Classes in MEI.harmony

[att.chordDef.log](#), [att.chordMember.log](#), [att.f.log](#), [att.harm.log](#)

### Data Types in MEI.harmony

– no data types defined in MEI.harmony –

## MEI.header

Metadata header component declarations.

### Elements in MEI.header

```
<accessRestrict>, <acquisition>, <altId>, <appInfo>, <application>, <attUsage>, <audience>, <availability>, <bifolium>, <byline>, <captureMode>, <carrierForm>, <category>, <catRel>, <change>, <changeDesc>, <classDecls>, <classification>, <componentList>, <condition>, <contentItem>, <contents>, <context>, <correction>, <cutout>, <dedication>, <domainsDecl>, <editionStmt>, <editorialDecl>, <encodingDesc>, <exhibHist>, <extMeta>, <fileChar>, <fileDesc>, <foliaDesc>, <folium>, <hand>, <handList>, <history>, <incipCode>, <incipText>, <inscription>, <interpretation>, <key>, <language>, <langUsage>, <meiHead>, <mensuration>, <meter>, <namespace>, <normalization>, <notesStmt>, <otherChar>, <patch>, <perfDuration>, <perfMedium>, <perfRes>, <perfResList>, <physDesc>, <physMedium>, <plateNum>, <playingSpeed>, <price>, <projectDesc>, <provenance>, <pubStmt>, <revisionDesc>, <samplingDecl>, <scoreFormat>, <segmentation>, <seriesStmt>, <soundChan>, <source>, <sourceDesc>, <specRepro>, <stdVals>, <sysReq>, <tagsDecl>, <tagUsage>, <taxonomy>, <termList>, <titleStmt>, <trackConfig>, <treatHist>, <treatSched>, <unpub>, <useRestrict>, <watermark>, <work>, <workList>
```

### Model Classes in MEI.header

model.bifoliumLike, model.editorialDeclPart, model.encodingPart, model.eventPart, model.foliumLike, model.frontAndBackPart, model.headerPart, model.paperModLike, model.physDescPart, model.pubStmtPart, model.startLike.header, model.workIdent, model.workLike

### Macro Groups in MEI.header

macro.availabilityPart, macro.bibldescPart

### Attribute Classes in MEI.header

att.bifoliumSurfaces, att.foliumSurfaces, att.perfRes, att.perfRes.basic, att.adlibitum, att.recordType, att.regularMethod

### Data Types in MEI.header

- no data types defined in MEI.header -

## MEI.lyrics

Lyrics component declarations.

### Elements in MEI.lyrics

[`<refrain>`](#), [`<verse>`](#), [`<volta>`](#)

### Model Classes in MEI.lyrics

`model.verseLike`

### Macro Groups in MEI.lyrics

– no macro groups defined in MEI.lyrics –

### Attribute Classes in MEI.lyrics

[`att.lyrics.log`](#), [`att.refrain.log`](#), [`att.verse.log`](#), [`att.volta.log`](#)

### Data Types in MEI.lyrics

– no data types defined in MEI.lyrics –

## **MEI.mensural**

Mensural repertoire component declarations.

### **Elements in MEI.mensural**

[`<ligature>`](#), [`<mensur>`](#), [`<plica>`](#), [`<proport>`](#), [`<stem>`](#)

### **Model Classes in MEI.mensural**

[`model.eventLike.mensural`](#), [`model.layerPart.mensural`](#), [`model.staffDefPart.mensural`](#), [`model.staffPart.mensural`](#)

### **Macro Groups in MEI.mensural**

– no macro groups defined in MEI.mensural –

### **Attribute Classes in MEI.mensural**

[`att.duration.quality`](#), [`att.ligature.log`](#), [`att.mensural.log`](#), [`att.mensural.shared`](#), [`att.note.anl.mensural`](#),  
[`att.note.ges.mensural`](#), [`att.note.log.mensural`](#), [`att.note.vis.mensural`](#), [`att.plica.log`](#), [`att.proport.log`](#),  
[`att.rest.ges.mensural`](#), [`att.rest.vis.mensural`](#), [`att.scoreDef.log.mensural`](#), [`att.scoreDef.vis.mensural`](#),  
[`att.staffDef.log.mensural`](#), [`att.staffDef.vis.mensural`](#), [`att.stem.log`](#), [`att.stems.mensural`](#)

### **Data Types in MEI.mensural**

[`data.DURATION.mensural`](#), [`data.MULTIBREVERESTS.mensural`](#), [`data.DURATIONRESTS.mensural`](#),  
[`data.DURQUALITY.mensural`](#), [`data.FLAGFORM.mensural`](#), [`data.FLAGPOS.mensural`](#), [`data.STAFFITEM.mensural`](#),  
[`data.STEMFORM.mensural`](#)

## MEI.midi

MIDI component declarations.

### Elements in MEI.midi

<cc>, <chan>, <chanPr>, <cue>, <hex>, <instrDef>, <instrGrp>, <marker>, <metaText>, <midi>, <noteOff>, <noteOn>, <port>, <prog>, <seqNum>, <trkName>, <vel>

### Model Classes in MEI.midi

[model.midiLike](#)

### Macro Groups in MEI.midi

– no macro groups defined in MEI.midi –

### Attribute Classes in MEI.midi

[att.channelized](#), [att.instrDef.log](#), [att.instrumentIdent](#), [att.midi.event](#), [att.midi.log](#), [att.midInstrument](#),  
[att.midiNumber](#), [att.midiTempo](#), [att.midiValue](#), [att.midiValue2](#), [att.midiVelocity](#), [att.timeBase](#)

### Data Types in MEI.midi

– no data types defined in MEI.midi –

## MEI.msDesc

Manuscript description component declarations.

### Elements in MEI.msDesc

<accMat>, <addDesc>, <binding>, <bindingDesc>, <catchwords>, <collation>, <colophon>, <decoDesc>, <decoNote>, <explicit>, <foliation>, <heraldry>, <layout>, <layoutDesc>, <locus>, <locusGrp>, <rubric>, <scriptDesc>, <scriptNote>, <seal>, <sealDesc>, <secFolio>, <signatures>, <stamp>, <support>, <supportDesc>, <typeDesc>, <typeNote>

### Model Classes in MEI.msDesc

[model.msInline](#)

### Macro Groups in MEI.msDesc

– no macro groups defined in MEI.msDesc –

### Attribute Classes in MEI.msDesc

[att.componentType](#)

### Data Types in MEI.msDesc

– no data types defined in MEI.msDesc –

## MEI.namesdates

Names and dates component declarations.

### Elements in MEI.namesdates

<addName>, <bloc>, <corpName>, <country>, <district>, <famName>, <foreName>, <genName>, <geogFeat>, <geogName>, <nameLink>, <periodName>, <persName>, <postBox>, <postCode>, <region>, <roleName>, <settlement>, <street>, <styleName>

### Model Classes in MEI.namesdates

`model.addressPart`, `model.geogNamePart`, `model.nameLike.agent`, `model.nameLike.geogName`,  
`model.nameLike.label`, `model.nameLike.place`, `model.persNamePart`

### Macro Groups in MEI.namesdates

– no macro groups defined in MEI.namesdates –

### Attribute Classes in MEI.namesdates

– no attribute classes defined in MEI.namesdates –

### Data Types in MEI.namesdates

– no data types defined in MEI.namesdates –

## MEI.neumes

Neume repertoire component declarations.

### Elements in MEI.neumes

[`<episema>`](#), [`<hispanTick>`](#), [`<liquecent>`](#), [`<nc>`](#), [`<ncGrp>`](#), [`<neume>`](#), [`<oriscus>`](#), [`<quilisma>`](#), [`<signifLet>`](#), [`<strophicus>`](#), [`<syllable>`](#), [`<divLine>`](#)

### Model Classes in MEI.neumes

`model.eventLike.neumes`, `model.layerPart.neumes`, `model.neumeComponentModifierLike`,  
`model.neumeModifierLike`, `model.neumePart`, `model.syllableLike`, `model.syllablePart`

### Macro Groups in MEI.neumes

– no macro groups defined in MEI.neumes –

### Attribute Classes in MEI.neumes

`att.divLine.log`, `att.episema.log`, `att.hispanTick.log`, `att.liquescent.log`, `att.nc.log`, `att.ncForm`, `att.ncGrp.log`,  
`att.neume.log`, `att.oriscus.log`, `att.quilisma.log`, `att.signifLet.log`, `att.strophicus.log`, `att.syllable.log`

### Data Types in MEI.neumes

`data.STAFFITEM.neumes`

## **MEI.performance**

Performance component declarations.

### **Elements in MEI.performance**

<avFile>, <clip>, <performance>, <recording>, <when>

### **Model Classes in MEI.performance**

– no model classes defined in MEI.performance –

### **Macro Groups in MEI.performance**

– no macro groups defined in MEI.performance –

### **Attribute Classes in MEI.performance**

att.alignment

### **Data Types in MEI.performance**

– no data types defined in MEI.performance –

## **MEI.ptrref**

Pointer and reference component declarations.

### **Elements in MEI.ptrref**

[`<ptr>`](#), [`<ref>`](#)

### **Model Classes in MEI.ptrref**

[model.locrefLike](#)

### **Macro Groups in MEI.ptrref**

– no macro groups defined in MEI.ptrref –

### **Attribute Classes in MEI.ptrref**

– no attribute classes defined in MEI.ptrref –

### **Data Types in MEI.ptrref**

– no data types defined in MEI.ptrref –

## MEI.shared

Component declarations that are shared between two or more modules.

### Elements in MEI.shared

```
<accid>, <actor>, <address>, <addrLine>, <ambitus>, <ambNote>, <analytic>, <annot>, <arranger>, <artic>, <author>, <barLine>, <bibl>, <biblList>, <biblScope>, <biblStruct>, <body>, <caesura>, <caption>, <castGrp>, <castItem>, <castList>, <cb>, <chord>, <clef>, <clefGrp>, <colLayout>, <composer>, <contributor>, <creation>, <custos>, <date>, <dedicatee>, <depth>, <desc>, <dim>, <dimensions>, <dir>, <distributor>, <div>, <dot>, <dynam>, <edition>, <editor>, <ending>, <event>, <eventList>, <expansion>, <extent>, <extData>, <funder>, <genre>, <group>, <grpSym>, <head>, <height>, <identifier>, <imprint>, <incip>, <keyAccid>, <keySig>, <label>, <labelAbbr>, <layer>, <layerDef>, <lb>, <lg>, <librettist>, <lyricist>, <mdiv>, <mei>, <monogr>, <music>, <name>, <note>, <num>, <ornam>, <p>, <pad>, <part>, <parts>, <pb>, <pgDesc>, <pgFoot>, <pgHead>, <phrase>, <physLoc>, <publisher>, <pubPlace>, <recipient>, <relatedItem>, <relation>, <relationList>, <rend>, <repository>, <resp>, <respStmt>, <rest>, <role>, <roleDesc>, <sb>, <score>, <scoreDef>, <section>, <series>, <space>, <speaker>, <sponsor>, <stack>, <staff>, <staffDef>, <staffGrp>, <syl>, <symbol>, <tempo>, <term>, <textLang>, <title>, <titlePage>, <titlePart>, <width>
```

### Model Classes in MEI.shared

```

# Element Specifications

## <abbr>

(abbreviation) – A generic element for 1) a shortened form of a word, including an acronym or 2) a shorthand notation.

### Referenced in chapters

[11.2 Editorial Markup](#), [11.2.1 Abbreviations](#), [11.2.1.1 Instructions](#)

### Module

[MEI.edittrans](#)

### Attributes

**@cert** (*optional*) Signifies the degree of certainty or precision associated with a feature. Value conforms to [data.CERTAINTY](#).

<abbr> → att.edit → att.evidence → @cert

**@class** (*optional*) Contains one or more URIs which denote classification terms that apply to the entity bearing this attribute. One or more values from [data.URI](#), separated by spaces.

<abbr> → att.common → att.typed → att.classed → @class

**@copyof** (*optional*) Points to an element of which the current element is a copy. Value conforms to [data.URI](#).

<abbr> → att.common → att.linking → @copyof

**@corresp** (*optional*) Used to point to other elements that correspond to this one in a generic fashion. One or more values from [data.URI](#), separated by spaces.

<abbr> → att.common → att.linking → @corresp

**@decls** (*optional*) Identifies one or more metadata elements (other than classification terms) within the header, which are understood to apply to the element bearing this attribute and its content. One or more values from [data.URI](#), separated by spaces.

<abbr> → att.trans → att.metadataPointing → @decls

**@evidence** (*optional*) Indicates the nature of the evidence supporting the reliability or accuracy of the intervention or interpretation. Allowed values are: "**internal**" (*There is evidence within the document to support the intervention.*), "**external**" (*There is evidence outside the document to support the intervention.*), "**conjecture**" (*The assertion has been made by the editor, cataloguer, or scholar on the basis of their expertise.*)

<abbr> → att.edit → att.evidence → @evidence

**@expan** (*optional*) Records the expansion of a text abbreviation. Value is plain text.

<abbr> → direct children → @expan

**@facs** (*optional*) Points to one or more images, portions of an image, or surfaces which correspond to the current element. One or more values from [data.URI](#), separated by spaces.

<abbr> → att.facsimile → @facs

**@follows** (*optional*) points to one or more events in a user-defined collection that are known to be predecessors of the current element. One or more values from [data.URI](#), separated by spaces.

<abbr> → att.common → att.linking → @follows

**@hand** (*optional*) Signifies the hand responsible for an action. The value must be the ID of a <hand> element declared in the header. Value conforms to [data.URI](#).

<abbr> → att.trans → att.handIdent → @hand

**@instant** The @instant attribute is syntactic sugar for classifying a scribal intervention as an ad-hoc modification; that is, one which does not interrupt the writing process. Value must conform to **data.BOOLEAN** or **unknown**.

<abbr> → att.trans → att.geneticState → @instant

**@label (optional)** Captures text to be used to generate a label for the element to which it's attached, a "tool tip" or prefatory text, for example. Should not be used to record document content. Value is plain text.

<abbr> → att.common → att.labelled → @label

**@n (optional)** Provides a number-like designation that indicates an element's position in a sequence of similar elements. May not contain space characters. Value conforms to **data.WORD**.

<abbr> → att.common → att.nNumberLike → @n

**@next (optional)** Used to point to the next event(s) in a user-defined collection. One or more values from **data.URI**, separated by spaces.

<abbr> → att.common → att.linked → @next

**@precedes (optional)** Points to one or more events in a user-defined collection that are known to be successors of the current element. One or more values from **data.URI**, separated by spaces.

<abbr> → att.common → att.linked → @precedes

**@prev (optional)** Points to the previous event(s) in a user-defined collection. One or more values from **data.URI**, separated by spaces.

<abbr> → att.common → att.linked → @prev

**@resp (optional)** Indicates the agent(s) responsible for some aspect of the text's transcription, editing, or encoding. Its value must point to one or more identifiers declared in the document header. One or more values from **data.URI**, separated by spaces.

<abbr> → att.common → att.responsibility → @resp

**@sameas (optional)** Points to an element that is the same as the current element but is not a literal copy of the current element. One or more values from **data.URI**, separated by spaces.

<abbr> → att.common → att.linked → @sameas

**@seq (optional)** Used to assign a sequence number related to the order in which the encoded features carrying this attribute are believed to have occurred. Value is a positive integer.

<abbr> → att.trans → att.sequence → @seq

**@source (optional)** Contains a list of one or more pointers indicating the sources which attest to a given reading. Each value should correspond to the ID of a **<source>** or **<manifestation>** element located in the document header. One or more values from **data.URI**, separated by spaces.

<abbr> → att.edit → att.source → @source

**@state** Points to the genetic state that results from this modification. One or more values from **data.URI**, separated by spaces.

<abbr> → att.trans → att.geneticState → @state

**@synch (optional)** Points to elements that are synchronous with the current element. One or more values from **data.URI**, separated by spaces.

<abbr> → att.common → att.linked → @synch

**@translit (optional)** Specifies the transliteration technique used. Value is a **NMOKEN**.

<abbr> → att.lang → @translit

**@type** (*optional*) Designation which characterizes the element in some sense, using any convenient classification scheme or typology that employs single-token labels. One or more values of datatype **NMTOKEN**, separated by spaces.

<abbr> → att.common → att.typed → @type

**@xml:base** (*optional*) Provides a base URI reference with which applications can resolve relative URI references into absolute URI references. Value conforms to [data.URI](#).

<abbr> → att.common → att.basic → @xml:base

**@xml:id** (*optional*) Regularizes the naming of an element and thus facilitates building links between it and other resources. Each id attribute within a document must have a unique value. Value is a valid [xml:id](#).

<abbr> → att.common → att.basic → att.id → @xml:id

**@xml:lang** (*optional*) Identifies the language of the element's content. The values for this attribute are language 'tags' as defined in BCP 47. All language tags that make use of private use sub-tags must be documented in a corresponding language element in the MEI header whose id attribute is the same as the language tag's value. Value is a [language](#).

<abbr> → att.lang → @xml:lang

## Member of

[model.editorialLike](#) Groups editorial intervention elements.

## Contained By

**<abbr>** A generic element for 1) a shortened form of a word, including an acronym or 2) a shorthand notation.

<abbr> → model.editorialLike → model.textPhraseLike.limited → model.editTransPart.text → model.editTransPart → <abbr>

**<acquisition>** Records information concerning the process by which an item was acquired by the holding institution.

<abbr> → model.editorialLike → model.textPhraseLike.limited → <acquisition>

**<actor>** Name of an actor appearing within a cast list.

<abbr> → model.editorialLike → model.textPhraseLike.limited → <actor>

**<add>** Marks an addition to the text.

<abbr> → model.editorialLike → model.textPhraseLike.limited → model.editTransPart.text → model.editTransPart → <add>

**<addName>** Contains an additional name component, such as a nickname, epithet, or alias, or any other descriptive phrase used within a personal name.

<abbr> → model.editorialLike → model.textPhraseLike.limited → model.textPhraseLike → <addName>

**<addrLine>** Single line of a postal address.

<abbr> → model.editorialLike → model.textPhraseLike.limited → model.textPhraseLike → <addrLine>

**<anchoredText>** Container for text that is fixed to a particular page location, regardless of changes made to the layout of the measures around it.

<abbr> → model.editorialLike → model.textPhraseLike.limited → <anchoredText>

**<annot>** Provides a statement explaining the text or indicating the basis for an assertion.

<abbr> → model.editorialLike → model.textPhraseLike.limited → model.textPhraseLike → <annot>

**<arranger>** A person or organization who transcribes a musical composition, usually for a different medium from that of the original; in an arrangement the musical substance remains essentially unchanged.

<abbr> → model.editorialLike → model.textPhraseLike.limited → <arranger>

**<attacca>** An instruction to begin the next section or movement of a composition without pause.

<abbr> → model.editorialLike → model.textPhraseLike.limited → <attacca>

**<author>** The name of the creator of the intellectual content of a non-musical, literary work.

<abbr> → model.editorialLike → model.textPhraseLike.limited → <author>

**<bibl>** Provides a loosely-structured bibliographic citation in which the sub-components may or may not be explicitly marked.

<abbr> → model.editorialLike → model.textPhraseLike.limited → model.textPhraseLike → <bibl>

**<biblScope>** Defines the scope of a bibliographic reference, for example as a list of page numbers, or a named subdivision of a larger work.

<abbr> → model.editorialLike → model.textPhraseLike.limited → <biblScope>

**<bindingDesc>** Describes the present and former bindings of an item.

<abbr> → model.editorialLike → model.textPhraseLike.limited → <bindingDesc>

**<bloc>** Contains the name of a geopolitical unit consisting of two or more nation states or countries.

<abbr> → model.editorialLike → model.textPhraseLike.limited → model.textPhraseLike → <bloc>

**<bracketSpan>** Marks a sequence of notational events grouped by a bracket.

<abbr> → model.editorialLike → model.textPhraseLike.limited → <bracketSpan>

**<byline>** Contains the primary statement of responsibility given for a work on its title page.

<abbr> → model.editorialLike → model.textPhraseLike.limited → <byline>

**<caption>** A label which accompanies an illustration or a table.

<abbr> → model.editorialLike → model.textPhraseLike.limited → model.textPhraseLike → <caption>

**<choice>** Groups a number of alternative encodings for the same point in a text.

<abbr> → model.editorialLike → model.choicePart → <choice>

**<composer>** The name of the creator of the intellectual content of a musical work.

<abbr> → model.editorialLike → model.textPhraseLike.limited → <composer>

**<contentItem>** Contains a single entry within a content description element.

<abbr> → model.editorialLike → model.textPhraseLike.limited → model.textPhraseLike → <contentItem>

**<contributor>** Names of individuals, institutions, or organizations responsible for contributions to the intellectual content of a work, where the specialized elements for authors, editors, etc. do not suffice or do not apply.

<abbr> → model.editorialLike → model.textPhraseLike.limited → <contributor>

**<corpName>** Identifies an organization or group of people that acts as a single entity.

<abbr> → model.editorialLike → model.textPhraseLike.limited → model.textPhraseLike → <corpName>

**<corr>** Contains the correct form of an apparent erroneous passage.

<abbr> → model.editorialLike → model.textPhraseLike.limited → model.editTransPart.text → model.editTransPart → <corr>

**<country>** Contains the name of a geopolitical unit, such as a nation, country, colony, or commonwealth, larger than or administratively superior to a region and smaller than a bloc.

<abbr> → model.editorialLike → model.textPhraseLike.limited → model.textPhraseLike → <country>

**<cpMark>** A verbal or graphical indication to copy musical material written elsewhere.

<abbr> → model.editorialLike → model.textPhraseLike.limited → <cpMark>

**<creation>** Non-bibliographic details of the creation of an intellectual entity, in narrative form, such as the date, place, and circumstances of its composition. More detailed information may be captured within the history element.

<abbr> → model.editorialLike → model.textPhraseLike.limited → <creation>

**<damage>** Contains an area of damage to the physical medium.

<abbr> → model.editorialLike → model.textPhraseLike.limited → model.editTransPart.text → model.editTransPart → <damage>

**<date>** A string identifying a point in time or the time period between two such points.

<abbr> → model.editorialLike → model.textPhraseLike.limited → model.textPhraseLike → <date>

**<decoDesc>** Contains a description of the decoration of an item.

<abbr> → model.editorialLike → model.textPhraseLike.limited → <decoDesc>

**<decoNote>** Contains a description of one or more decorative features of an item.

<abbr> → model.editorialLike → model.textPhraseLike.limited → <decoNote>

**<dedicatee>** Entity to whom a creative work is formally offered.

<abbr> → model.editorialLike → model.textPhraseLike.limited → <dedicatee>

**<dedication>** Contains a dedicatory statement.

<abbr> → model.editorialLike → model.textPhraseLike.limited → <dedication>

**<del>** Contains information deleted, marked as deleted, or otherwise indicated as superfluous or spurious in the copy text by an author, scribe, annotator, or corrector.

<abbr> → model.editorialLike → model.textPhraseLike.limited → model.editTransPart.text → model.editTransPart → <del>

**<depth>** Description of a measurement taken through a three-dimensional object.

<abbr> → model.editorialLike → model.textPhraseLike.limited → <depth>

**<desc>** Container for text that briefly describes the feature to which it is attached, including its intended usage, purpose, or application as appropriate.

<abbr> → model.editorialLike → model.textPhraseLike.limited → <desc>

**<dim>** Any single dimensional specification.

<abbr> → model.editorialLike → model.textPhraseLike.limited → <dim>

**<dir>** An instruction expressed as a combination of text and symbols, typically above, below, or between staves, but not on the staff — that is not encoded elsewhere in more specific elements, like <tempo>, <dynam> or <repeatMark>.

<abbr> → model.editorialLike → model.textPhraseLike.limited → <dir>

**<distributor>** Person or agency, other than a publisher, from which access (including electronic access) to a bibliographic entity may be obtained.

<abbr> → model.editorialLike → model.textPhraseLike.limited → <distributor>

**<district>** Contains the name of any kind of subdivision of a settlement, such as a parish, ward, or other administrative or geographic unit.

<abbr> → model.editorialLike → model.textPhraseLike.limited → model.textPhraseLike → <district>

**<dynam>** Indication of the volume of a note, phrase, or section of music.

<abbr> → model.editorialLike → model.textPhraseLike.limited → <dynam>

**<edition>** A word or text phrase that indicates a difference in either content or form between the item being described and a related item previously issued by the same publisher/distributor (e.g., 2nd edition, version 2.0, etc.), or simultaneously issued by either the same publisher/distributor or another publisher/distributor (e.g., large print edition, British edition, etc.).

<abbr> → model.editorialLike → model.textPhraseLike.limited → <edition>

**<editor>** The name of the individual(s), institution(s) or organization(s) acting in an editorial capacity.

<abbr> → model.editorialLike → model.textPhraseLike.limited → <editor>

**<epigraph>** Contains a quotation, anonymous or attributed, appearing on a title page.

<abbr> → model.editorialLike → model.textPhraseLike.limited → model.textPhraseLike → model.paracontentPart → <epigraph>

**<exhibHist>** A record of public exhibitions, including dates, venues, etc.

<abbr> → model.editorialLike → model.textPhraseLike.limited → <exhibHist>

**<expan>** Contains the expansion of an abbreviation.

<abbr> → model.editorialLike → model.textPhraseLike.limited → model.editTransPart.text → model.editTransPart → <expan>

**<extent>** Used to express size in terms other than physical dimensions, such as number of pages, records, bytes, physical components, etc.

<abbr> → model.editorialLike → model.textPhraseLike.limited → <extent>

**<f>** Single element of a figured bass indication.

<abbr> → model.editorialLike → model.textPhraseLike.limited → <f>

**<famName>** Contains a family (inherited) name, as opposed to a given, baptismal, or nick name.

<abbr> → model.editorialLike → model.textPhraseLike.limited → model.textPhraseLike → <famName>

**<figDesc>** Contains a brief prose description of the appearance or content of a graphic figure, for use when documenting an image without displaying it.

<abbr> → model.editorialLike → model.textPhraseLike.limited → <figDesc>

**<fing>** finger – An individual finger in a fingering indication.

<abbr> → model.editorialLike → model.textPhraseLike.limited → <fing>

**<foreName>** Contains a forename, given or baptismal name.

<abbr> → model.editorialLike → model.textPhraseLike.limited → model.textPhraseLike → <foreName>

**<funder>** Names of individuals, institutions, or organizations responsible for funding. Funders provide financial support for a project; they are distinct from sponsors, who provide intellectual support and authority.

<abbr> → model.editorialLike → model.textPhraseLike.limited → <funder>

**<genName>** Contains a name component used to distinguish otherwise similar names on the basis of the relative ages or generations of the persons named.

<abbr> → model.editorialLike → model.textPhraseLike.limited → model.textPhraseLike → <genName>

**<genre>** Term or terms that designate a category characterizing a particular style, form, or content.

<abbr> → model.editorialLike → model.textPhraseLike.limited → <genre>

**<geogFeat>** Contains a common noun identifying a geographical feature.

<abbr> → model.editorialLike → model.textPhraseLike.limited → model.textPhraseLike → <geogFeat>

**<geogName>** The proper noun designation for a place, natural feature, or political jurisdiction.

<abbr> → model.editorialLike → model.textPhraseLike.limited → model.textPhraseLike → <geogName>

**<gliss>** A continuous or sliding movement from one pitch to another, usually indicated by a straight or wavy line.

<abbr> → model.editorialLike → model.textPhraseLike.limited → <gliss>

**<hand>** Defines a distinct scribe or handwriting style.

<abbr> → model.editorialLike → model.textPhraseLike.limited → <hand>

**<harm>** An indication of harmony, e.g., chord names, tablature grids, harmonic analysis, figured bass.

<abbr> → model.editorialLike → model.textPhraseLike.limited → <harm>

**<head>** Contains any heading, for example, the title of a section of text, or the heading of a list.

<abbr> → model.editorialLike → model.textPhraseLike.limited → model.textPhraseLike → <head>

**<height>** Description of the vertical size of an object.

<abbr> → model.editorialLike → model.textPhraseLike.limited → <height>

**<identifier>** An alpha-numeric string that establishes the identity of the described material.

<abbr> → model.editorialLike → model.textPhraseLike.limited → model.textPhraseLike → <identifier>

**<imprimatur>** Contains a formal statement authorizing the publication of a work, sometimes required to appear on a title page or its verso.

<abbr> → model.editorialLike → model.textPhraseLike.limited → model.textPhraseLike → model.paracontentPart → <imprimatur>

**<imprint>** Information relating to the publication or distribution of a bibliographic item.

<abbr> → model.editorialLike → model.textPhraseLike.limited → model.textPhraseLike → <imprint>

**<l>** Contains a single line of text within a line group.

<abbr> → model.editorialLike → model.textPhraseLike.limited → model.textPhraseLike → <l>

**<label>** A container for document text that identifies the feature to which it is attached. For a "tool tip" or other generated label, use the label attribute.

<abbr> → model.editorialLike → model.textPhraseLike.limited → <label>

**<labelAbbr>** A label on the pages following the first.

<abbr> → model.editorialLike → model.textPhraseLike.limited → <labelAbbr>

**<language>** Description of a language used in the document.

<abbr> → model.editorialLike → model.textPhraseLike.limited → <language>

**<layoutDesc>** Collects layout descriptions.

<abbr> → model.editorialLike → model.textPhraseLike.limited → <layoutDesc>

**<lem>** (lemma) – Contains the lemma, or base text, of a textual variation.

<abbr> → model.editorialLike → model.textPhraseLike.limited → model.rdgPart.text → model.rdgPart → <lem>

**<li>** Single item in a <list>.

<abbr> → model.editorialLike → model.textPhraseLike.limited → model.textPhraseLike → <li>

**<librettist>** Person or organization who is a writer of the text of an opera, oratorio, etc.

<abbr> → model.editorialLike → model.textPhraseLike.limited → <librettist>

**<line>** A visual line that cannot be represented by a more specific; i.e., semantic, element.

<abbr> → model.editorialLike → model.textPhraseLike.limited → <line>

**<lyricist>** Person or organization who is a writer of the text of a song.

<abbr> → model.editorialLike → model.textPhraseLike.limited → <lyricist>

**<metaMark>** A graphical or textual statement with additional / explanatory information about the musical text. The textual consequences of this intervention are encoded independently via other means; that is, with elements such as <add>, <del>, etc.

<abbr> → model.editorialLike → model.textPhraseLike.limited → <metaMark>

**<name>** Proper noun or noun phrase.

<abbr> → model.editorialLike → model.textPhraseLike.limited → model.textPhraseLike → <name>

**<nameLink>** Contains a connecting phrase or link used within a name but not regarded as part of it, such as "van der" or "of", "from", etc.

<abbr> → model.editorialLike → model.textPhraseLike.limited → model.textPhraseLike → <nameLink>

**<num>** Numeric information in any form.

<abbr> → model.editorialLike → model.textPhraseLike.limited → model.textPhraseLike → <num>

**<octave>** An indication that a passage should be performed one or more octaves above or below its written pitch.

<abbr> → model.editorialLike → model.textPhraseLike.limited → <octave>

**<orig>** Contains material which is marked as following the original, rather than being normalized or corrected.

<abbr> → model.editorialLike → model.textPhraseLike.limited → model.editTransPart.text → model.editTransPart → <orig>

**<ornam>** An element indicating an ornament that is not a mordent, turn, or trill.

<abbr> → model.editorialLike → model.textPhraseLike.limited → <ornam>

**<p>** One or more text phrases that form a logical prose passage.

<abbr> → model.editorialLike → model.textPhraseLike.limited → model.textPhraseLike → model.paracontentPart → <p>

**<perfRes>** Name of an instrument on which a performer plays, a performer's voice range, or a standard performing ensemble designation.

<abbr> → model.editorialLike → model.textPhraseLike.limited → <perfRes>

**<periodName>** A label that describes a period of time, such as 'Baroque' or '3rd Style period'.

<abbr> → model.editorialLike → model.textPhraseLike.limited → model.textPhraseLike → <periodName>

**<persName>** Designation for an individual, including any or all of that individual's forenames, surnames, honorific titles, and added names.

<abbr> → model.editorialLike → model.textPhraseLike.limited → model.textPhraseLike → <persName>

**<pgFoot>** A running footer.

<abbr> → model.editorialLike → model.textPhraseLike.limited → <pgFoot>

**<pgHead>** A running header.

<abbr> → model.editorialLike → model.textPhraseLike.limited → <pgHead>

**<price>** The cost of access to a bibliographic item.

<abbr> → model.editorialLike → model.textPhraseLike.limited → <price>

**<provenance>** The record of ownership or custodianship of an item.

<abbr> → model.editorialLike → model.textPhraseLike.limited → <provenance>

**<pubPlace>** Name of the place where a bibliographic item was published.

<abbr> → model.editorialLike → model.textPhraseLike.limited → <pubPlace>

**<publisher>** Name of the organization responsible for the publication of a bibliographic item.

<abbr> → model.editorialLike → model.textPhraseLike.limited → <publisher>

**<q>** Contains material which is distinguished from the surrounding phrase-level text using quotation marks or a similar method. Use **<quote>** for block-level quotations.

<abbr> → model.editorialLike → model.textPhraseLike.limited → model.textPhraseLike → <q>

**<quote>** Contains a paragraph-like block of text attributed to an external source, normally set off from the surrounding text by spacing or other typographic distinction.

<abbr> → model.editorialLike → model.textPhraseLike.limited → model.textPhraseLike → model.paracontentPart → <quote>

**<rdg>** (reading) – Contains a single reading within a textual variation.

<abbr> → model.editorialLike → model.textPhraseLike.limited → model.rdgPart.text → model.rdgPart → <rdg>

**<recipient>** The name of the individual(s), institution(s) or organization(s) receiving correspondence.

<abbr> → model.editorialLike → model.textPhraseLike.limited → <recipient>

**<ref>** Defines a traversible reference to another location. May contain text and sub-elements that describe the destination.

<abbr> → model.editorialLike → model.textPhraseLike.limited → model.textPhraseLike → <ref>

**<reg>** Contains material which has been regularized or normalized in some sense.

<abbr> → model.editorialLike → model.textPhraseLike.limited → model.editTransPart.text → model.editTransPart → <reg>

**<region>** Contains the name of an administrative unit such as a state, province, or county, larger than a settlement, but smaller than a country.

<abbr> → model.editorialLike → model.textPhraseLike.limited → model.textPhraseLike → <region>

**<rend>** A formatting element indicating special visual rendering, e.g., bold or italicized, of a text word or phrase.

<abbr> → model.editorialLike → model.textPhraseLike.limited → model.textPhraseLike → <rend>

**<repeatMark>** An instruction expressed as a combination of text and symbols – segno and coda – typically above, below, or between staves, but not on the staff.

<abbr> → model.editorialLike → model.textPhraseLike.limited → <repeatMark>

**<repository>** Institution, agency, or individual which holds a bibliographic item.

<abbr> → model.editorialLike → model.textPhraseLike.limited → <repository>

**<resp>** A phrase describing the nature of intellectual responsibility.

<abbr> → model.editorialLike → model.textPhraseLike.limited → <resp>

**<restore>** Indicates restoration of material to an earlier state by cancellation of an editorial or authorial marking or instruction.

<abbr> → model.editorialLike → model.textPhraseLike.limited → model.editTransPart.text → model.editTransPart → <restore>

**<role>** Name of a dramatic role, as given in a cast list.

<abbr> → model.editorialLike → model.textPhraseLike.limited → <role>

**<roleDesc>** Describes a character's role in a drama.

<abbr> → model.editorialLike → model.textPhraseLike.limited → <roleDesc>

**<roleName>** Contains a name component which indicates that the referent has a particular role or position in society, such as an official title or rank.

<abbr> → model.editorialLike → model.textPhraseLike.limited → model.textPhraseLike → <roleName>

**<scriptDesc>** Contains a description of the letters or characters used in an autographic item.

<abbr> → model.editorialLike → model.textPhraseLike.limited → <scriptDesc>

**<seal>** A single seal or similar attachment.

<abbr> → model.editorialLike → model.textPhraseLike.limited → <seal>

**<sealDesc>** Describes the seals or similar external attachments applied to an item.

<abbr> → model.editorialLike → model.textPhraseLike.limited → <sealDesc>

**<seg>** (arbitrary segment) represents any segmentation of text below the "text component" level.

<abbr> → model.editorialLike → model.textPhraseLike.limited → model.textPhraseLike → <seg>

**<settlement>** Contains the name of a settlement such as a city, town, or village identified as a single geopolitical or administrative unit.

<abbr> → model.editorialLike → model.textPhraseLike.limited → model.textPhraseLike → <settlement>

**<sic>** Contains apparently incorrect or inaccurate material.

<abbr> → model.editorialLike → model.textPhraseLike.limited → model.editTransPart.text → model.editTransPart → <sic>

**<signifLet>** Significantive letter(s).

<abbr> → model.editorialLike → model.textPhraseLike.limited → <signifLet>

**<soundChan>** Reflects the number of apparent sound channels in the playback of a recording (monaural, stereophonic, quadraphonic, etc.).

<abbr> → model.editorialLike → model.textPhraseLike.limited → <soundChan>

**<speaker>** Contains a specialized form of heading or label, giving the name of one or more speakers in a dramatic text or fragment.

<abbr> → model.editorialLike → model.textPhraseLike.limited → <speaker>

**<sponsor>** Names of sponsoring individuals, organizations or institutions. Sponsors give their intellectual authority to a project; they are to be distinguished from funders, who provide the funding but do not necessarily take intellectual responsibility.

<abbr> → model.editorialLike → model.textPhraseLike.limited → <sponsor>

**<stack>** An inline table with a single column.

<abbr> → model.editorialLike → model.textPhraseLike.limited → <stack>

**<stageDir>** Contains any kind of stage direction within a dramatic text or fragment.

<abbr> → model.editorialLike → model.textPhraseLike.limited → <stageDir>

**<street>** full street address including any name or number identifying a building as well as the name of the street or route on which it is located.

<abbr> → model.editorialLike → model.textPhraseLike.limited → model.textPhraseLike → <street>

**<styleName>** A label for a characteristic style of writing or performance, such as 'bebop' or 'rock-n-roll'.

<abbr> → model.editorialLike → model.textPhraseLike.limited → model.textPhraseLike → <styleName>

**<supplied>** Contains material supplied by the transcriber or editor for any reason.

<abbr> → model.editorialLike → model.textPhraseLike.limited → model.editTransPart.text → model.editTransPart → <supplied>

**<supportDesc>** Groups elements describing the physical support material of an item.

<abbr> → model.editorialLike → model.textPhraseLike.limited → <supportDesc>

**<syl>** Individual lyric syllable.

<abbr> → model.editorialLike → model.textPhraseLike.limited → <syl>

**<td>** Designates a table cell that contains data as opposed to a cell that contains column or row heading information.

<abbr> → model.editorialLike → model.textPhraseLike.limited → model.textPhraseLike → <td>

**<tempo>** Text and symbols descriptive of tempo, mood, or style, e.g., "allarg.", "a tempo", "cantabile", "Moderato", "J=60", "Moderato J =60").

<abbr> → model.editorialLike → model.textPhraseLike.limited → <tempo>

**<term>** Keyword or phrase which describes a resource.

<abbr> → model.editorialLike → model.textPhraseLike.limited → <term>

**<textLang>** Identifies the languages and writing systems within the work described by a bibliographic description, not the language of the description.

<abbr> → model.editorialLike → model.textPhraseLike.limited → <textLang>

**<th>** Designates a table cell containing column or row heading information as opposed to one containing data.

<abbr> → model.editorialLike → model.textPhraseLike.limited → model.textPhraseLike → <th>

**<treatHist>** A record of the treatment the item has undergone (e.g., de-acidification, restoration, etc.).

<abbr> → model.editorialLike → model.textPhraseLike.limited → <treatHist>

**<treatSched>** Scheduled treatment, e.g., de-acidification, restoration, etc., for an item.

<abbr> → model.editorialLike → model.textPhraseLike.limited → <treatSched>

**<typeDesc>** Contains a description of the typefaces or other aspects of the printing of a printed source.

<abbr> → model.editorialLike → model.textPhraseLike.limited → <typeDesc>

**<unclear>** Contains material that cannot be transcribed with certainty because it is illegible or inaudible in the source.

<abbr> → model.editorialLike → model.textPhraseLike.limited → model.editTransPart.text → model.editTransPart → <unclear>

**<width>** Description of the horizontal size of an object.

<abbr> → model.editorialLike → model.textPhraseLike.limited → <width>

## May Contain

**<abbr>** A generic element for 1) a shortened form of a word, including an acronym or 2) a shorthand notation.

<abbr> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.editorialLike → <abbr>

**<accid>** Records a temporary alteration to the pitch of a note.

<abbr> → model.layerPart → model.layerPart.mensuralAndNeumes → model.noteModifierLike → <accid>

**<add>** Marks an addition to the text.

<abbr> → model.transcriptionLike → <add>

**<address>** Contains a postal address, for example of a publisher, an organization, or an individual.

<abbr> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.addressLike → <address>

**<anchoredText>** Container for text that is fixed to a particular page location, regardless of changes made to the layout of the measures around it.

<abbr> → model.graphicPrimitiveLike → <anchoredText>

**<annot>** Provides a statement explaining the text or indicating the basis for an assertion.

<abbr> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.annotLike → <annot>

**<arpeg>** Indicates that the notes of a chord are to be performed successively rather than simultaneously, usually from lowest to highest. Sometimes called a "roll".

<abbr> → model.editTransPart → model.editTransPart.music → model.controlEventLike.cmn → <arpeg>

**<artic>** An indication of how to play a note or chord.

<abbr> → model.layerPart → model.layerPart.mensuralAndNeumes → model.noteModifierLike → <artic>

**<attacca>** An instruction to begin the next section or movement of a composition without pause.

<abbr> → model.editTransPart → model.editTransPart.music → model.controlEventLike.cmn → <attacca>

**<bTrem>** A rapid alternation on a single pitch or chord.

<abbr> → model.layerPart → model.layerPart.cmn → model.eventLike.cmn → <bTrem>

**<barLine>** Vertical line drawn through one or more staves that divides musical notation into metrical units.

<abbr> → model.layerPart → model.eventLike → <barLine>

**<beam>** A container for a series of explicitly beamed events that begins and ends entirely within a measure.

<abbr> → model.layerPart → model.layerPart.cmn → model.eventLike.cmn → <beam>

**<beamSpan>** Alternative element for explicitly encoding beams, particularly those which extend across bar lines.

<abbr> → model.editTransPart → model.editTransPart.music → model.controlEventLike.cmn → <beamSpan>

**<beatRpt>** An indication that material on a preceding beat should be repeated.

<abbr> → model.layerPart → model.layerPart.cmn → model.eventLike.cmn → <beatRpt>

**<bend>** A variation in pitch (often micro-tonal) upwards or downwards during the course of a note.

<abbr> → model.editTransPart → model.editTransPart.music → model.controlEventLike → <bend>

**<bibl>** Provides a loosely-structured bibliographic citation in which the sub-components may or may not be explicitly marked.

<abbr> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.biblLike → <bibl>

**<biblList>** List of bibliographic references.

<abbr> → model.editTransPart → model.editTransPart.text → model.textComponentLike → model.listLike → <biblList>

**<biblStruct>** Contains a bibliographic citation in which bibliographic sub-elements must appear in a specified order.

<abbr> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.biblLike → <biblStruct>

**<bloc>** Contains the name of a geopolitical unit consisting of two or more nation states or countries.

<abbr> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <bloc>

**<bracketSpan>** Marks a sequence of notational events grouped by a bracket.

<abbr> → model.editTransPart → model.editTransPart.music → model.controlEventLike.cmn → <bracketSpan>

**<breath>** An indication of a point at which the performer on an instrument requiring breath (including the voice) may breathe.

<abbr> → model.editTransPart → model.editTransPart.music → model.controlEventLike.cmn → <breath>

**<caesura>** Break, pause, or interruption in the normal tempo of a composition. Typically indicated by "railroad tracks", i.e., two diagonal slashes.

<abbr> → model.editTransPart → model.editTransPart.music → model.controlEventLike → <caesura>

**<castList>** Contains a single cast list or *dramatis personae*.

<abbr> → model.editTransPart → model.editTransPart.text → model.textComponentLike → model.listLike → <castList>

**<catchwords>** Describes the system used to ensure correct ordering of the quires making up an item, typically by means of annotations at the foot of the page.

<abbr> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.mslinline → <catchwords>

**<cb>** An empty formatting element that forces text to begin in a new column.

<abbr> → model.milestoneLike.music → <cb>

**<choice>** Groups a number of alternative encodings for the same point in a text.

<abbr> → model.editLike → <choice>

**<chord>** A simultaneous sounding of two or more notes in the same layer \*with the same duration\*.

<abbr> → model.layerPart → model.eventLike → <chord>

**<clef>** Indication of the exact location of a particular note on the staff and, therefore, the other notes as well.

<abbr> → model.layerPart → model.eventLike → <clef>

**<clefGrp>** A set of simultaneously-occurring clefs.

<abbr> → model.layerPart → model.eventLike → <clefGrp>

**<colLayout>** An empty formatting element that signals the start of columnar layout.

<abbr> → model.milestoneLike.music → <colLayout>

**<corpName>** Identifies an organization or group of people that acts as a single entity.

<abbr> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.nameLike → model.nameLike.agent → <corpName>

**<corr>** Contains the correct form of an apparent erroneous passage.

<abbr> → model.transcriptionLike → <corr>

**<country>** Contains the name of a geopolitical unit, such as a nation, country, colony, or commonwealth, larger than or administratively superior to a region and smaller than a bloc.

<abbr> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <country>

**<cpMark>** A verbal or graphical indication to copy musical material written elsewhere.

<abbr> → model.editTransPart → model.editTransPart.music → model.controlEventLike → <cpMark>

**<curve>** A curved line that cannot be represented by a more specific element, such as a slur.

<abbr> → model.graphicPrimitiveLike → <curve>

**<custos>** Symbol placed at the end of a line of music to indicate the first note of the next line.

Sometimes called a "direct".

<abbr> → model.layerPart → model.eventLike → <custos>

**<damage>** Contains an area of damage to the physical medium.

<abbr> → model.transcriptionLike → <damage>

**<date>** A string identifying a point in time or the time period between two such points.

<abbr> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.dateLike → <date>

**<dedicatee>** Entity to whom a creative work is formally offered.

<abbr> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → <dedicatee>

**<del>** Contains information deleted, marked as deleted, or otherwise indicated as superfluous or spurious in the copy text by an author, scribe, annotator, or corrector.

<abbr> → model.transcriptionLike → <del>

**<depth>** Description of a measurement taken through a three-dimensional object.

<abbr> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.dimLike → <depth>

**<dim>** Any single dimensional specification.

<abbr> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.dimLike → <dim>

**<dimensions>** Information about the physical size of an entity; usually includes numerical data.

<abbr> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → <dimensions>

**<dir>** An instruction expressed as a combination of text and symbols, typically above, below, or between staves, but not on the staff — that is not encoded elsewhere in more specific elements, like <tempo>, <dynam> or <repeatMark>.

<abbr> → model.editTransPart → model.editTransPart.music → model.controlEventLike → <dir>

**<district>** Contains the name of any kind of subdivision of a settlement, such as a parish, ward, or other administrative or geographic unit.

<abbr> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <district>

**<div>** Major structural division of text, such as a preface, chapter or section.

<abbr> → model.divLike → <div>

**<divLine>** Represents a division (divisio) in neume notation. Divisions indicate short, medium, or long pauses similar to breath marks in modern notation.

<abbr> → model.layerPart → model.layerPart.mensuralAndNeumes → model.layerPart.neumes → model.eventLike.neumes → <divLine>

**<dot>** Dot of augmentation or division.

<abbr> → model.layerPart → model.layerPart.mensuralAndNeumes → model.layerPart.mensural → model.eventLike.mensural → <dot>

**<dot>** Dot of augmentation or division.

<abbr> → model.layerPart → model.layerPart.mensuralAndNeumes → model.noteModifierLike → <dot>

**<dynam>** Indication of the volume of a note, phrase, or section of music.

<abbr> → model.editTransPart → model.editTransPart.music → model.controlEventLike → <dynam>

**<ending>** Alternative ending for a repeated passage of music; i.e., prima volta, seconda volta, etc.

<abbr> → model.sectionPart → model.endingLike → <ending>

**<episema>** Episema.

<abbr> → model.neumeModifierLike → <episema>

**<eventList>** Contains historical information given as a sequence of significant past events.

<abbr> → model.editTransPart → model.editTransPart.text → model.textComponentLike → model.listLike → <eventList>

**<expan>** Contains the expansion of an abbreviation.

<abbr> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.editorialLike → <expan>

**<extent>** Used to express size in terms other than physical dimensions, such as number of pages, records, bytes, physical components, etc.

<abbr> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → <extent>

**<f>** Single element of a figured bass indication.

<abbr> → model.fLike → <f>

**<fTrem>** A rapid alternation between a pair of notes (or chords or perhaps between a note and a chord) that are (usually) farther apart than a major second.

<abbr> → model.layerPart → model.layerPart.cmn → model.eventLike.cmn → <fTrem>

**<fermata>** An indication placed over a note or rest to indicate that it should be held longer than its written value. May also occur over a bar line to indicate the end of a phrase or section. Sometimes called a 'hold' or 'pause'.

<abbr> → model.editTransPart → model.editTransPart.music → model.controlEventLike.cmn → <fermata>

**<fig>** Groups elements representing or containing graphic information such as an illustration or figure.

<abbr> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.figureLike → <fig>

**<fing>** finger – An individual finger in a fingering indication.

<abbr> → model.editTransPart → model.editTransPart.music → model.controlEventLike → model.fingeringLike → <fing>

**<fingGrp>** (finger group)– A group of individual fingers in a fingering indication.

<abbr> → model.editTransPart → model.editTransPart.music → model.controlEventLike → model.fingeringLike → <fingGrp>

**<gap>** Indicates a point where material has been omitted in a transcription, whether as part of sampling practice or for editorial reasons described in the MEI header.

<abbr> → model.transcriptionLike → <gap>

**<geogFeat>** Contains a common noun identifying a geographical feature.

<abbr> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <geogFeat>

**<geogName>** The proper noun designation for a place, natural feature, or political jurisdiction.

<abbr> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.nameLike → model.nameLike.place → model.nameLike.g

**<gliss>** A continuous or sliding movement from one pitch to another, usually indicated by a straight or wavy line.

<abbr> → model.editTransPart → model.editTransPart.music → model.controlEventLike → <gliss>

**<graceGrp>** A container for a sequence of grace notes.

<abbr> → model.layerPart → model.layerPart.cmn → model.eventLike.cmn → <graceGrp>

**<hairpin>** Indicates continuous dynamics expressed on the score as wedge-shaped graphics, e.g., < and >.

<abbr> → model.editTransPart → model.editTransPart.music → model.controlEventLike.cmn → <hairpin>

**<halfmRpt>** A half-measure repeat in any meter.

<abbr> → model.layerPart → model.layerPart.cmn → model.eventLike.cmn → <halfmRpt>

**<handShift>** Marks the beginning of a passage written in a new hand, or of a change in the scribe, writing style, ink or character of the document hand.

<abbr> → model.transcriptionLike → <handShift>

**<harm>** An indication of harmony, e.g., chord names, tablature grids, harmonic analysis, figured bass.

<abbr> → model.editTransPart → model.editTransPart.music → model.controlEventLike → model.controlEventLike.harmony → model.harmLike → <harm>

**<harpPedal>** Harp pedal diagram.

<abbr> → model.editTransPart → model.editTransPart.music → model.controlEventLike.cmn → <harpPedal>

**<height>** Description of the vertical size of an object.

<abbr> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.dimLike → <height>

**<heraldry>** Contains a heraldic formula or phrase, typically found as part of a blazon, coat of arms, etc.

<abbr> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.mslInline → <heraldry>

**<hispanTick>** Hispanic tick.

<abbr> → model.neumeModifierLike → <hispanTick>

**<identifier>** An alpha-numeric string that establishes the identity of the described material.

<abbr> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.identifierLike → <identifier>

**<keySig>** Written key signature.

<abbr> → model.layerPart → model.eventLike → model.keySigLike → <keySig>

**<layer>** An independent stream of events on a staff.

<abbr> → model.editTransPart → model.editTransPart.music → model.layerLike → <layer>

**<lb>** An empty formatting element that forces text to begin on a new line.

<abbr> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.lbLike → <lb>

**<lg>** May be used for any section of text that is organized as a group of lines; however, it is most often used for a group of verse lines functioning as a formal unit, e.g., a stanza, refrain, verse paragraph, etc.

<abbr> → model.editTransPart → model.editTransPart.text → model.textComponentLike → model.lgLike → <lg>

**<ligature>** A mensural notation symbol that combines two or more notes into a single sign.

<abbr> → model.layerPart → model.layerPart.mensuralAndNeumes → model.layerPart.mensural → model.eventLike.mensural → <ligature>

**<line>** A visual line that cannot be represented by a more specific; i.e., semantic, element.

<abbr> → model.graphicPrimitiveLike → <line>

**<liquefiant>** Liquescent.

<abbr> → model.neumeComponentModifierLike → <liquefiant>

**<list>** A formatting element that contains a series of items separated from one another and arranged in a linear, often vertical, sequence.

<abbr> → model.editTransPart → model.editTransPart.text → model.textComponentLike → model.listLike → <list>

**<locus>** Defines a location within a manuscript or manuscript component, usually as a (possibly discontinuous) sequence of folio references.

<abbr> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.msInline → <locus>

**<locusGrp>** Groups locations which together form a distinct but discontinuous item within a manuscript or manuscript part, according to a specific foliation.

<abbr> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.msInline → <locusGrp>

**<lv>** A "tie-like" indication that a note should ring beyond its written duration.

<abbr> → model.editTransPart → model.editTransPart.music → model.controlEventLike.cmn → <lv>

**<mRest>** Complete measure rest in any meter.

<abbr> → model.layerPart → model.layerPart.cmn → model.eventLike.measureFilling → <mRest>

**<mRpt>** An indication that the previous measure should be repeated.

<abbr> → model.layerPart → model.layerPart.cmn → model.eventLike.measureFilling → <mRpt>

**<mRpt2>** An indication that the previous two measures should be repeated.

<abbr> → model.layerPart → model.layerPart.cmn → model.eventLike.measureFilling → <mRpt2>

**<mSpace>** A measure containing only empty space in any meter.

<abbr> → model.layerPart → model.layerPart.cmn → model.eventLike.measureFilling → <mSpace>

**<measure>** Unit of musical time consisting of a fixed number of note values of a given type, as determined by the prevailing meter, and delimited in musical notation by bar lines.

<abbr> → model.sectionPart → model.sectionPart.cmn → model.measureLike → <measure>

**<mensur>** Collects information about the metrical relationship between a note value and the next smaller value; that is, either triple or duple.

<abbr> → model.layerPart → model.layerPart.mensuralAndNeumes → model.layerPart.mensural → model.eventLike.mensural → <mensur>

**<metaMark>** A graphical or textual statement with additional / explanatory information about the musical text. The textual consequences of this intervention are encoded independently via other means; that is, with elements such as <add>, <del>, etc.

<abbr> → model.editTransPart → model.editTransPart.music → model.controlEventLike → <metaMark>

**<meterSig>** Written meter signature.

<abbr> → model.layerPart → model.eventLike → model.meterSigLike → <meterSig>

**<meterSigGrp>** Used to capture alternating, interchanging, mixed or other non-standard meter signatures.

<abbr> → model.layerPart → model.eventLike → model.meterSigLike → <meterSigGrp>

**<midi>** Container for elements that contain information useful when generating MIDI output.

<abbr> → model.layerPart → model.layerPart.mensuralAndNeumes → model.midiLike → <midi>

**<mordent>** An ornament indicating rapid alternation of the main note with a secondary note, usually a step below, but sometimes a step above.

<abbr> → model.editTransPart → model.editTransPart.music → model.controlEventLike.cmn → model.ornamentLike.cmn → <mordent>

**<multiRest>** Multiple measures of rest compressed into a single symbol, frequently found in performer parts.

<abbr> → model.layerPart → model.layerPart.cmn → model.eventLike.measureFilling → <multiRest>

**<multiRpt>** Multiple repeated measures.

<abbr> → model.layerPart → model.layerPart.cmn → model.eventLike.measureFilling → <multiRpt>

**<name>** Proper noun or noun phrase.

<abbr> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.nameLike → <name>

**<nc>** Sign representing a single pitched event, although the exact pitch may not be known.

<abbr> → model.neumePart → <nc>

**<ncGrp>** Collection of one or more neume components.

<abbr> → model.neumePart → <ncGrp>

**<neume>** Sign representing one or more musical pitches.

<abbr> → model.layerPart → model.layerPart.mensuralAndNeumes → model.layerPart.neumes → model.eventLike.neumes → <neume>

**<note>** A single pitched event.

<abbr> → model.layerPart → model.eventLike → <note>

**<num>** Numeric information in any form.

<abbr> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.measurementLike → model.numLike → <num>

**<octave>** An indication that a passage should be performed one or more octaves above or below its written pitch.

<abbr> → model.editTransPart → model.editTransPart.music → model.controlEventLike.cmn → <octave>

**<orig>** Contains material which is marked as following the original, rather than being normalized or corrected.

<abbr> → model.transcriptionLike → <orig>

**<oriscus>** Oriscus.

<abbr> → model.neumeComponentModifierLike → <oriscus>

**<ornam>** An element indicating an ornament that is not a mordent, turn, or trill.

<abbr> → model.editTransPart → model.editTransPart.music → model.controlEventLike → <ornam>

**<p>** One or more text phrases that form a logical prose passage.

<abbr> → model.editTransPart → model.editTransPart.text → model.textComponentLike → model.pLike → <p>

**<pad>** An indication of extra visual space between notational elements.

<abbr> → model.layerPart → model.eventLike → <pad>

**<pb>** An empty formatting element that forces text to begin on a new page.

<abbr> → model.milestoneLike.music → model.pbLike → <pb>

**<pedal>** Piano pedal mark.

<abbr> → model.editTransPart → model.editTransPart.music → model.controlEventLike.cmn → <pedal>

**<periodName>** A label that describes a period of time, such as 'Baroque' or '3rd Style period'.

<abbr> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.nameLike.label → <periodName>

**<persName>** Designation for an individual, including any or all of that individual's forenames, surnames, honorific titles, and added names.

<abbr> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.nameLike → model.nameLike.agent → <persName>

**<phrase>** Indication of 1) a "unified melodic idea" or 2) performance technique.

<abbr> → model.editTransPart → model.editTransPart.music → model.controlEventLike → <phrase>

**<postBox>** (postal box or post office box) contains a number or other identifier for some postal delivery point other than a street address.

<abbr> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.addressPart → <postBox>

**<postCode>** (postal code) contains a numerical or alphanumeric code used as part of a postal address to simplify sorting or delivery of mail.

<abbr> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.addressPart → <postCode>

**<proport>** Description of note duration as arithmetic ratio.

<abbr> → model.layerPart → model.layerPart.mensuralAndNeumes → model.layerPart.mensural → model.eventLike.mensural → <proport>

**<ptr>** Defines a traversible pointer to another location, using only attributes to describe the destination.

<abbr> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.locrefLike → <ptr>

**<q>** Contains material which is distinguished from the surrounding phrase-level text using quotation marks or a similar method. Use **<quote>** for block-level quotations.

<abbr> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.qLike → <q>

**<quilisma>** Quilisma.

<abbr> → model.neumeComponentModifierLike → <quilisma>

**<quote>** Contains a paragraph-like block of text attributed to an external source, normally set off from the surrounding text by spacing or other typographic distinction.

<abbr> → model.editTransPart → model.editTransPart.text → model.textComponentLike → model.quoteLike → <quote>

**<ref>** Defines a traversible reference to another location. May contain text and sub-elements that describe the destination.

<abbr> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.locrefLike → <ref>

**<refrain>** Recurring lyrics, especially at the end of each verse or stanza of a poem or song lyrics; a chorus.

<abbr> → model.editTransPart → model.editTransPart.music → model.verseLike → <refrain>

**<reg>** Contains material which has been regularized or normalized in some sense.

<abbr> → model.transcriptionLike → <reg>

**<region>** Contains the name of an administrative unit such as a state, province, or county, larger than a settlement, but smaller than a country.

<abbr> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <region>

**<reh>** In an orchestral score and its corresponding parts, a mark indicating a convenient point from which to resume rehearsal after a break.

<abbr> → model.editTransPart → model.editTransPart.music → model.controlEventLike.cmn → <reh>

**<relation>** Describes a relationship or linkage amongst entities.

<abbr> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.relationLike → <relation>

**<relationList>** Gathers relation elements.

<abbr> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.relationLike → <relationList>

**<rend>** A formatting element indicating special visual rendering, e.g., bold or italicized, of a text word or phrase.

<abbr> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.rendLike → <rend>

**<repeatMark>** An instruction expressed as a combination of text and symbols – segno and coda – typically above, below, or between staves, but not on the staff.

<abbr> → model.editTransPart → model.editTransPart.music → model.controlEventLike → <repeatMark>

**<repository>** Institution, agency, or individual which holds a bibliographic item.

<abbr> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.nameLike → model.nameLike.place → model.repository

**<rest>** A non-sounding event found in the source being transcribed.

<abbr> → model.layerPart → model.eventLike → <rest>

**<restore>** Indicates restoration of material to an earlier state by cancellation of an editorial or authorial marking or instruction.

<abbr> → model.transcriptionLike → <restore>

**<sb>** An empty formatting element that forces musical notation to begin on a new line.

<abbr> → model.milestoneLike.music → <sb>

**<scoreDef>** Container for score meta-information.

<abbr> → model.sectionPart → model.scoreDefLike → <scoreDef>

**<secFolio>** Marks the word or words taken from a fixed point in a codex (typically the beginning of the second leaf) in order to provide a unique identifier for the item.

<abbr> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.msInline → <secFolio>

**<section>** Segment of music data.

<abbr> → model.sectionPart → model.sectionLike → <section>

**<seg>** (arbitrary segment) represents any segmentation of text below the "text component" level.

<abbr> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → <seg>

**<settlement>** Contains the name of a settlement such as a city, town, or village identified as a single geopolitical or administrative unit.

<abbr> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <settlement>

**<sic>** Contains apparently incorrect or inaccurate material.

<abbr> → model.transcriptionLike → <sic>

**<signatures>** Provides a description of the leaf or quire signatures found within a codex.

<abbr> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.msInline → <signatures>

**<signifLet>** Significantive letter(s).

<abbr> → model.neumeModifierLike → <signifLet>

**<slur>** Indication of 1) a "unified melodic idea" or 2) performance technique.

<abbr> → model.editTransPart → model.editTransPart.music → model.controlEventLike.cmn → <slur>

**<sp>** Contains an individual speech in a performance text.

<abbr> → model.editTransPart → model.editTransPart.music → model.controlEventLike → <sp>

**<space>** A placeholder used to fill an incomplete measure, layer, etc. most often so that the combined duration of the events equals the number of beats in the measure.

<abbr> → model.layerPart → model.eventLike → <space>

**<stack>** An inline table with a single column.

<abbr> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.renderLike → <stack>

**<staff>** A group of equidistant horizontal lines on which notes are placed in order to represent pitch or a grouping element for individual 'strands' of notes, rests, etc. that may or may not actually be rendered on staff lines; that is, both diastematic and non-diastematic signs.

<abbr> → model.sectionPart → model.sectionPart.mensuralAndNeumes → model.staffLike → <staff>

**<staffDef>** Container for staff meta-information.

<abbr> → model.sectionPart → model.staffDefLike → <staffDef>

**<staffGrp>** A group of bracketed or braced staves.

<abbr> → model.staffGrpLike → <staffGrp>

**<stageDir>** Contains any kind of stage direction within a dramatic text or fragment.

<abbr> → model.editTransPart → model.editTransPart.music → model.controlEventLike → model.stageDirLike → <stageDir>

**<stamp>** Contains a word or phrase describing an official mark indicating ownership, genuineness, validity, etc.

<abbr> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.msInline → <stamp>

**<street>** full street address including any name or number identifying a building as well as the name of the street or route on which it is located.

<abbr> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.addressPart → <street>

**<strophicus>** Strophicus.

<abbr> → model.neumeComponentModifierLike → <strophicus>

**<styleName>** A label for a characteristic style of writing or performance, such as 'bebop' or 'rock-n-roll'.

<abbr> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.nameLike.label → <styleName>

**<subst>** Groups transcriptional elements when the combination is to be regarded as a single intervention in the text.

<abbr> → model.editLike → <subst>

**<supplied>** Contains material supplied by the transcriber or editor for any reason.

<abbr> → model.transcriptionLike → <supplied>

**<syl>** Individual lyric syllable.

<abbr> → model.editTransPart → model.sylLike → <syl>

**<syllable>** Neume notation can be thought of as "neumed text". Therefore, the syllable element provides high-level organization in this repertoire.

<abbr> → model.layerPart → model.layerPart.mensuralAndNeumes → model.layerPart.neumes → model.syllableLike → <syllable>

**<symbol>** A reference to a previously defined symbol.

<abbr> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → <symbol>

**<table>** Contains text displayed in tabular form.

<abbr> → model.editTransPart → model.editTransPart.text → model.textComponentLike → model.tableLike → <table>

**<tempo>** Text and symbols descriptive of tempo, mood, or style, e.g., "allarg.", "a tempo", "cantabile", "Moderato", "J=60", "Moderato J =60").

<abbr> → model.editTransPart → model.editTransPart.music → model.controlEventLike → <tempo>

**<term>** Keyword or phrase which describes a resource.

<abbr> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → <term>

**<tie>** An indication that two notes of the same pitch form a single note with their combined rhythmic values.

<abbr> → model.editTransPart → model.editTransPart.music → model.controlEventLike.cmn → <tie>

**<title>** Title of a bibliographic entity.

<abbr> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.titleLike → <title>

**<trill>** Rapid alternation of a note with another (usually at the interval of a second above).

<abbr> → model.editTransPart → model.editTransPart.music → model.controlEventLike.cmn → model.ornamentLike.cmn → <trill>

**<tuplet>** A group of notes with "irregular" (sometimes called "irrational") rhythmic values, for example, three notes in the time normally occupied by two or nine in the time of five.

<abbr> → model.layerPart → model.layerPart.cmn → model.eventLike.cmn → <tuplet>

**<tupletSpan>** Alternative element for encoding tuplets, especially useful for tuplets that extend across bar lines.

<abbr> → model.editTransPart → model.editTransPart.music → model.controlEventLike.cmn → <tupletSpan>

**<turn>** An ornament consisting of four notes — the upper neighbor of the written note, the written note, the lower neighbor, and the written note.

<abbr> → model.editTransPart → model.editTransPart.music → model.controlEventLike.cmn → model.ornamentLike.cmn → <turn>

**<unclear>** Contains material that cannot be transcribed with certainty because it is illegible or inaudible in the source.

<abbr> → model.transcriptionLike → <unclear>

**<verse>** Division of a poem or song lyrics, sometimes having a fixed length, meter or rhyme scheme; a stanza.

<abbr> → model.editTransPart → model.editTransPart.music → model.verseLike → <verse>

**<volta>** Sung text for a specific iteration of a repeated section of music.

<abbr> → model.editTransPart → model.editTransPart.music → <volta>

**<watermark>** Contains a description of a watermark or similar device.

<abbr> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.msInline → <watermark>

**<width>** Description of the horizontal size of an object.

<abbr> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.dimLike → <width>

## Remarks

In no case should <abbr> contain elements that would not otherwise be permitted to occur within the parent of its own <app> ancestor. For example, when used as a descendent of <verse>, <abbr> should only contain those elements allowed within <verse>.

The model of this element is based on the `abbr` element of the Text Encoding Initiative (TEI) and the `abbr` element of the Encoded Archival Description (EAD).

DEVELOPMENT  
VERSION

## <accMat>

Holds a description of any additional material bound with an item, such as non-contemporaneous documents or fragments.

### Module

[MEI.msDesc](#)

### Attributes

**@analog** (*optional*) Contains a reference to a field or element in another descriptive encoding system to which this MEI element is comparable. Value is plain text.

<accMat> → [att.bibl](#) → @analog

**@class** (*optional*) Contains one or more URIs which denote classification terms that apply to the entity bearing this attribute. One or more values from [data.URI](#), separated by spaces.

<accMat> → [att.common](#) → [att.typed](#) → [att.classed](#) → @class

**@copyof** (*optional*) Points to an element of which the current element is a copy. Value conforms to [data.URI](#).

<accMat> → [att.common](#) → [att.linking](#) → @copyof

**@corresp** (*optional*) Used to point to other elements that correspond to this one in a generic fashion. One or more values from [data.URI](#), separated by spaces.

<accMat> → [att.common](#) → [att.linking](#) → @corresp

**@follows** (*optional*) points to one or more events in a user-defined collection that are known to be predecessors of the current element. One or more values from [data.URI](#), separated by spaces.

<accMat> → [att.common](#) → [att.linking](#) → @follows

**@label** (*optional*) Captures text to be used to generate a label for the element to which it's attached, a "tool tip" or prefatory text, for example. Should not be used to record document content. Value is plain text.

<accMat> → [att.common](#) → [att.labelled](#) → @label

**@n** (*optional*) Provides a number-like designation that indicates an element's position in a sequence of similar elements. May not contain space characters. Value conforms to [data.WORD](#).

<accMat> → [att.common](#) → [att.nNumberLike](#) → @n

**@next** (*optional*) Used to point to the next event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<accMat> → [att.common](#) → [att.linking](#) → @next

**@precedes** (*optional*) Points to one or more events in a user-defined collection that are known to be successors of the current element. One or more values from [data.URI](#), separated by spaces.

<accMat> → [att.common](#) → [att.linking](#) → @precedes

**@prev** (*optional*) Points to the previous event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<accMat> → [att.common](#) → [att.linking](#) → @prev

**@resp** (*optional*) Indicates the agent(s) responsible for some aspect of the text's transcription, editing, or encoding. Its value must point to one or more identifiers declared in the document header. One or more values from [data.URI](#), separated by spaces.

<accMat> → att.common → att.responsibility → @resp

**@sameas** (*optional*) Points to an element that is the same as the current element but is not a literal copy of the current element. One or more values from [data.URI](#), separated by spaces.

<accMat> → att.common → att.linked → @sameas

**@synch** (*optional*) Points to elements that are synchronous with the current element. One or more values from [data.URI](#), separated by spaces.

<accMat> → att.common → att.linked → @synch

**@translit** (*optional*) Specifies the transliteration technique used. Value is a [NMTOKEN](#).

<accMat> → att.lang → @translit

**@type** (*optional*) Designation which characterizes the element in some sense, using any convenient classification scheme or typology that employs single-token labels. One or more values of datatype [NMTOKEN](#), separated by spaces.

<accMat> → att.common → att.typed → @type

**@xml:base** (*optional*) Provides a base URI reference with which applications can resolve relative URI references into absolute URI references. Value conforms to [data.URI](#).

<accMat> → att.common → att.basic → @xml:base

**@xml:id** (*optional*) Regularizes the naming of an element and thus facilitates building links between it and other resources. Each id attribute within a document must have a unique value. Value is a valid [xml:id](#).

<accMat> → att.common → att.basic → att.id → @xml:id

**@xml:lang** (*optional*) Identifies the language of the element's content. The values for this attribute are language 'tags' as defined in BCP 47. All language tags that make use of private use sub-tags must be documented in a corresponding language element in the MEI header whose id attribute is the same as the language tag's value. Value is a [language](#).

<accMat> → att.lang → @xml:lang

## Member of

[model.physDescPart](#) Groups elements that may appear as part of the physical description of a bibliographic item.

## Contained By

**<physDesc>** Container for information about the appearance, construction, or handling of physical materials, such as their dimension, quantity, color, style, and technique of creation.

<accMat> → [model.physDescPart](#) → <physDesc>

## May Contain

**<abbr>** A generic element for 1) a shortened form of a word, including an acronym or 2) a shorthand notation.

<accMat> → [macro.struc-unstrucContent](#) → [model.textPhraseLike.limited](#) → [model.editorialLike](#) → <abbr>

**<address>** Contains a postal address, for example of a publisher, an organization, or an individual.

<accMat> → [macro.struc-unstrucContent](#) → [model.textPhraseLike.limited](#) → [model.addressLike](#) → <address>

**<annot>** Provides a statement explaining the text or indicating the basis for an assertion.

<accMat> → [macro.struc-unstrucContent](#) → [model.textPhraseLike.limited](#) → [model.annotLike](#) → <annot>

**<bibl>** Provides a loosely-structured bibliographic citation in which the sub-components may or may not be explicitly marked.

<accMat> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.biblLike → <bibl>

**<biblStruct>** Contains a bibliographic citation in which bibliographic sub-elements must appear in a specified order.

<accMat> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.biblLike → <biblStruct>

**<bloc>** Contains the name of a geopolitical unit consisting of two or more nation states or countries.

<accMat> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <bloc>

**<catchwords>** Describes the system used to ensure correct ordering of the quires making up an item, typically by means of annotations at the foot of the page.

<accMat> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.mslInLine → <catchwords>

**<corpName>** Identifies an organization or group of people that acts as a single entity.

<accMat> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.nameLike → model.nameLike.agent → <corpName>

**<country>** Contains the name of a geopolitical unit, such as a nation, country, colony, or commonwealth, larger than or administratively superior to a region and smaller than a bloc.

<accMat> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <country>

**<date>** A string identifying a point in time or the time period between two such points.

<accMat> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.dateLike → <date>

**<dedicathee>** Entity to whom a creative work is formally offered.

<accMat> → macro.struc-unstrucContent → model.textPhraseLike.limited → <dedicathee>

**<depth>** Description of a measurement taken through a three-dimensional object.

<accMat> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.dimLike → <depth>

**<dim>** Any single dimensional specification.

<accMat> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.dimLike → <dim>

**<dimensions>** Information about the physical size of an entity; usually includes numerical data.

<accMat> → macro.struc-unstrucContent → model.textPhraseLike.limited → <dimensions>

**<district>** Contains the name of any kind of subdivision of a settlement, such as a parish, ward, or other administrative or geographic unit.

<accMat> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <district>

**<expan>** Contains the expansion of an abbreviation.

<accMat> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.editorialLike → <expan>

**<extent>** Used to express size in terms other than physical dimensions, such as number of pages, records, bytes, physical components, etc.

<accMat> → macro.struc-unstrucContent → model.textPhraseLike.limited → <extent>

**<fig>** Groups elements representing or containing graphic information such as an illustration or figure.

<accMat> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.figureLike → <fig>

**<geogFeat>** Contains a common noun identifying a geographical feature.

<accMat> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <geogFeat>

**<geogName>** The proper noun designation for a place, natural feature, or political jurisdiction.

<accMat> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.nameLike → model.nameLike.place → model.nameLike.geogName → <geogName>

**<head>** Contains any heading, for example, the title of a section of text, or the heading of a list.

<accMat> → macro.struc-unstrucContent → model.headLike → <head>

**<height>** Description of the vertical size of an object.

<accMat> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.dimLike → <height>

**<heraldry>** Contains a heraldic formula or phrase, typically found as part of a blazon, coat of arms, etc.

<accMat> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.msInline → <heraldry>

**<identifier>** An alpha-numeric string that establishes the identity of the described material.

<accMat> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.identifierLike → <identifier>

**<lb>** An empty formatting element that forces text to begin on a new line.

<accMat> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.lbLike → <lb>

**<locus>** Defines a location within a manuscript or manuscript component, usually as a (possibly discontinuous) sequence of folio references.

<accMat> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.msInline → <locus>

**<locusGrp>** Groups locations which together form a distinct but discontinuous item within a manuscript or manuscript part, according to a specific foliation.

<accMat> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.msInline → <locusGrp>

**<name>** Proper noun or noun phrase.

<accMat> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.nameLike → <name>

**<num>** Numeric information in any form.

<accMat> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.measurementLike → model.numLike → <num>

**<p>** One or more text phrases that form a logical prose passage.

<accMat> → macro.struc-unstrucContent → model.pLike → <p>

**<periodName>** A label that describes a period of time, such as 'Baroque' or '3rd Style period'.

<accMat> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.nameLike.label → <periodName>

**<persName>** Designation for an individual, including any or all of that individual's forenames, surnames, honorific titles, and added names.

<accMat> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.nameLike → model.nameLike.agent → <persName>

**<postBox>** (postal box or post office box) contains a number or other identifier for some postal delivery point other than a street address.

<accMat> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.addressPart → <postBox>

**<postCode>** (postal code) contains a numerical or alphanumeric code used as part of a postal address to simplify sorting or delivery of mail.

<accMat> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.addressPart → <postCode>

**<ptr>** Defines a traversible pointer to another location, using only attributes to describe the destination.

<accMat> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.locrefLike → <ptr>

**<q>** Contains material which is distinguished from the surrounding phrase-level text using quotation marks or a similar method. Use <quote> for block-level quotations.

<accMat> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.qLike → <q>

**<ref>** Defines a traversible reference to another location. May contain text and sub-elements that describe the destination.

<accMat> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.locrefLike → <ref>

**<region>** Contains the name of an administrative unit such as a state, province, or county, larger than a settlement, but smaller than a country.

<accMat> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <region>

**<relation>** Describes a relationship or linkage amongst entities.

<accMat> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.relationLike → <relation>

**<relationList>** Gathers relation elements.

<accMat> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.relationLike → <relationList>

**<rend>** A formatting element indicating special visual rendering, e.g., bold or italicized, of a text word or phrase.

<accMat> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.rendLike → <rend>

**<repository>** Institution, agency, or individual which holds a bibliographic item.

<accMat> → macro.struc-

unstrucContent → model.textPhraseLike.limited → model.nameLike → model.nameLike.place → model.repositoryLike → <repository>

**<secFolio>** Marks the word or words taken from a fixed point in a codex (typically the beginning of the second leaf) in order to provide a unique identifier for the item.

<accMat> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.msInline → <secFolio>

**<seg>** (arbitrary segment) represents any segmentation of text below the "text component" level.

<accMat> → macro.struc-unstrucContent → model.textPhraseLike.limited → <seg>

**<settlement>** Contains the name of a settlement such as a city, town, or village identified as a single geopolitical or administrative unit.

<accMat> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <settlement>

**<signatures>** Provides a description of the leaf or quire signatures found within a codex.

<accMat> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.msInline → <signatures>

**<stack>** An inline table with a single column.

<accMat> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.rendLike → <stack>

**<stamp>** Contains a word or phrase describing an official mark indicating ownership, genuineness, validity, etc.

<accMat> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.msInline → <stamp>

**<street>** full street address including any name or number identifying a building as well as the name of the street or route on which it is located.

<accMat> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.addressPart → <street>

**<styleName>** A label for a characteristic style of writing or performance, such as 'bebop' or 'rock-n-roll'.

<accMat> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.nameLike.label → <styleName>

**<symbol>** A reference to a previously defined symbol.

<accMat> → macro.struc-unstrucContent → model.textPhraseLike.limited → <symbol>

**<term>** Keyword or phrase which describes a resource.

<accMat> → macro.struc-unstrucContent → model.textPhraseLike.limited → <term>

**<title>** Title of a bibliographic entity.

<accMat> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.titleLike → <title>

**<watermark>** Contains a description of a watermark or similar device.

<accMat> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.msInline → <watermark>

<width> Description of the horizontal size of an object.

<accMat> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.dimLike → <width>

## Remarks

The model of this element is based on the [accMat](#) element of the Text Encoding Initiative (TEI).

## Declaration

```

## <accessRestrict>

(access restriction) – Describes the conditions that affect the accessibility of material.

### Referenced in chapters

[3.4.1.3 Publication, Distribution, etc.](#)

### Module

[MEI.header](#)

### Attributes

**@analog** (*optional*) Contains a reference to a field or element in another descriptive encoding system to which this MEI element is comparable. Value is plain text.

<accessRestrict> → [att.bibl](#) → @analog

**@auth** (*optional*) A name or label associated with a controlled vocabulary or other authoritative source for this element or its content. Value is plain text.

<accessRestrict> → [att.authorized](#) → @auth

**@auth.uri** (*optional*) A web-accessible location of the controlled vocabulary or other authoritative source of identification or definition for this element or its content. This attribute may contain a complete URI or a partial URI which is completed by the value of the codedval attribute. Value conforms to [data.URI](#).  
<accessRestrict> → [att.authorized](#) → @auth.uri

**@class** (*optional*) Contains one or more URIs which denote classification terms that apply to the entity bearing this attribute. One or more values from [data.URI](#), separated by spaces.

<accessRestrict> → [att.common](#) → [att.typed](#) → [att.classed](#) → @class

**@codedval** (*optional*) A value that represents or identifies other data. Often, it is a primary key in the database or a unique value in the coded list identified by the auth or auth.uri attributes. One or more values of datatype **NMTOKEN**, separated by spaces.

<accessRestrict> → [att.authorized](#) → [att.canonical](#) → @codedval

**@copyof** (*optional*) Points to an element of which the current element is a copy. Value conforms to [data.URI](#).

<accessRestrict> → [att.common](#) → [att.linked](#) → @copyof

**@corresp** (*optional*) Used to point to other elements that correspond to this one in a generic fashion. One or more values from [data.URI](#), separated by spaces.

<accessRestrict> → [att.common](#) → [att.linked](#) → @corresp

**@follows** (*optional*) points to one or more events in a user-defined collection that are known to be predecessors of the current element. One or more values from [data.URI](#), separated by spaces.

<accessRestrict> → [att.common](#) → [att.linked](#) → @follows

**@label** (*optional*) Captures text to be used to generate a label for the element to which it's attached, a "tool tip" or prefatory text, for example. Should not be used to record document content. Value is plain text.

<accessRestrict> → [att.common](#) → [att.labelled](#) → @label

**@n** (*optional*) Provides a number-like designation that indicates an element's position in a sequence of similar elements. May not contain space characters. Value conforms to [data.WORD](#).

<accessRestrict> → att.common → att.nNumberLike → @n

**@next** (*optional*) Used to point to the next event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<accessRestrict> → att.common → att.linked → @next

**@precedes** (*optional*) Points to one or more events in a user-defined collection that are known to be successors of the current element. One or more values from [data.URI](#), separated by spaces.

<accessRestrict> → att.common → att.linked → @precedes

**@prev** (*optional*) Points to the previous event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<accessRestrict> → att.common → att.linked → @prev

**@resp** (*optional*) Indicates the agent(s) responsible for some aspect of the text's transcription, editing, or encoding. Its value must point to one or more identifiers declared in the document header. One or more values from [data.URI](#), separated by spaces.

<accessRestrict> → att.common → att.responsibility → @resp

**@sameas** (*optional*) Points to an element that is the same as the current element but is not a literal copy of the current element. One or more values from [data.URI](#), separated by spaces.

<accessRestrict> → att.common → att.linked → @sameas

**@synch** (*optional*) Points to elements that are synchronous with the current element. One or more values from [data.URI](#), separated by spaces.

<accessRestrict> → att.common → att.linked → @synch

**@translit** (*optional*) Specifies the transliteration technique used. Value is a [NMTOKEN](#).

<accessRestrict> → att.lang → @translit

**@type** (*optional*) Designation which characterizes the element in some sense, using any convenient classification scheme or typology that employs single-token labels. One or more values of datatype [NMTOKEN](#), separated by spaces.

<accessRestrict> → att.common → att.type → @type

**@xml:base** (*optional*) Provides a base URI reference with which applications can resolve relative URI references into absolute URI references. Value conforms to [data.URI](#).

<accessRestrict> → att.common → att.basic → @xml:base

**@xml:id** (*optional*) Regularizes the naming of an element and thus facilitates building links between it and other resources. Each id attribute within a document must have a unique value. Value is a valid [xml:id](#).

<accessRestrict> → att.common → att.basic → att.id → @xml:id

**@xml:lang** (*optional*) Identifies the language of the element's content. The values for this attribute are language 'tags' as defined in BCP 47. All language tags that make use of private use sub-tags must be documented in a corresponding language element in the MEI header whose id attribute is the same as the language tag's value. Value is a [language](#).

<accessRestrict> → att.lang → @xml:lang

## Member of

[model.titlePagePart](#) Groups elements that may appear as part of a title page transcription.

## Contained By

**<titlePage>** Contains a transcription of the title page of a text.

<accessRestrict> → [model.titlePagePart](#) → <titlePage>

## May Contain

**<abbr>** A generic element for 1) a shortened form of a word, including an acronym or 2) a shorthand notation.

<accessRestrict> → [macro.struc-unstrucContent](#) → [model.textPhraseLike.limited](#) → [model.editorialLike](#) → <abbr>

**<address>** Contains a postal address, for example of a publisher, an organization, or an individual.

<accessRestrict> → [macro.struc-unstrucContent](#) → [model.textPhraseLike.limited](#) → [model.addressLike](#) → <address>

**<annot>** Provides a statement explaining the text or indicating the basis for an assertion.

<accessRestrict> → [macro.struc-unstrucContent](#) → [model.textPhraseLike.limited](#) → [model.annotLike](#) → <annot>

**<bibl>** Provides a loosely-structured bibliographic citation in which the sub-components may or may not be explicitly marked.

<accessRestrict> → [macro.struc-unstrucContent](#) → [model.textPhraseLike.limited](#) → [model.biblLike](#) → <bibl>

**<biblStruct>** Contains a bibliographic citation in which bibliographic sub-elements must appear in a specified order.

<accessRestrict> → [macro.struc-unstrucContent](#) → [model.textPhraseLike.limited](#) → [model.biblLike](#) → <biblStruct>

**<bloc>** Contains the name of a geopolitical unit consisting of two or more nation states or countries.

<accessRestrict> → [macro.struc-unstrucContent](#) → [model.textPhraseLike.limited](#) → [model.addressPart](#) → [model.geogNamePart](#) → <bloc>

**<catchwords>** Describes the system used to ensure correct ordering of the quires making up an item, typically by means of annotations at the foot of the page.

<accessRestrict> → [macro.struc-unstrucContent](#) → [model.textPhraseLike.limited](#) → [model.mslInLine](#) → <catchwords>

**<corpName>** Identifies an organization or group of people that acts as a single entity.

<accessRestrict> → [macro.struc-unstrucContent](#) → [model.textPhraseLike.limited](#) → [model.nameLike](#) → [model.nameLike.agent](#) → <corpName>

**<country>** Contains the name of a geopolitical unit, such as a nation, country, colony, or commonwealth, larger than or administratively superior to a region and smaller than a bloc.

<accessRestrict> → [macro.struc-unstrucContent](#) → [model.textPhraseLike.limited](#) → [model.addressPart](#) → [model.geogNamePart](#) → <country>

**<date>** A string identifying a point in time or the time period between two such points.

<accessRestrict> → [macro.struc-unstrucContent](#) → [model.textPhraseLike.limited](#) → [model.dateLike](#) → <date>

**<dedicataire>** Entity to whom a creative work is formally offered.

<accessRestrict> → [macro.struc-unstrucContent](#) → [model.textPhraseLike.limited](#) → <dedicataire>

**<depth>** Description of a measurement taken through a three-dimensional object.

<accessRestrict> → [macro.struc-unstrucContent](#) → [model.textPhraseLike.limited](#) → [model.dimLike](#) → <depth>

**<dim>** Any single dimensional specification.

<accessRestrict> → [macro.struc-unstrucContent](#) → [model.textPhraseLike.limited](#) → [model.dimLike](#) → <dim>

**<dimensions>** Information about the physical size of an entity; usually includes numerical data.

<accessRestrict> → [macro.struc-unstrucContent](#) → [model.textPhraseLike.limited](#) → <dimensions>

**<district>** Contains the name of any kind of subdivision of a settlement, such as a parish, ward, or other administrative or geographic unit.

<accessRestrict> → [macro.struc-unstrucContent](#) → [model.textPhraseLike.limited](#) → [model.addressPart](#) → [model.geogNamePart](#) → <district>

**<expan>** Contains the expansion of an abbreviation.

<accessRestrict> → [macro.struc-unstrucContent](#) → [model.textPhraseLike.limited](#) → [model.editorialLike](#) → <expan>

**<extent>** Used to express size in terms other than physical dimensions, such as number of pages, records, bytes, physical components, etc.

<accessRestrict> → macro.struc-unstrucContent → model.textPhraseLike.limited → <extent>

**<fig>** Groups elements representing or containing graphic information such as an illustration or figure.

<accessRestrict> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.figureLike → <fig>

**<geogFeat>** Contains a common noun identifying a geographical feature.

<accessRestrict> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <geogFeat>

**<geogName>** The proper noun designation for a place, natural feature, or political jurisdiction.

<accessRestrict> → macro.struc-

unstrucContent → model.textPhraseLike.limited → model.nameLike → model.nameLike.place → model.nameLike.geogName → <geogName>

**<head>** Contains any heading, for example, the title of a section of text, or the heading of a list.

<accessRestrict> → macro.struc-unstrucContent → model.headLike → <head>

**<height>** Description of the vertical size of an object.

<accessRestrict> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.dimLike → <height>

**<heraldry>** Contains a heraldic formula or phrase, typically found as part of a blazon, coat of arms, etc.

<accessRestrict> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.mslnline → <heraldry>

**<identifier>** An alpha-numeric string that establishes the identity of the described material.

<accessRestrict> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.identifierLike → <identifier>

**<lb>** An empty formatting element that forces text to begin on a new line.

<accessRestrict> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.lbLike → <lb>

**<locus>** Defines a location within a manuscript or manuscript component, usually as a (possibly discontinuous) sequence of folio references.

<accessRestrict> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.mslnline → <locus>

**<locusGrp>** Groups locations which together form a distinct but discontinuous item within a manuscript or manuscript part, according to a specific foliation.

<accessRestrict> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.mslnline → <locusGrp>

**<name>** Proper noun or noun phrase.

<accessRestrict> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.nameLike → <name>

**<num>** Numeric information in any form.

<accessRestrict> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.measurementLike → model.numLike → <num>

**<p>** One or more text phrases that form a logical prose passage.

<accessRestrict> → macro.struc-unstrucContent → model.pLike → <p>

**<periodName>** A label that describes a period of time, such as 'Baroque' or '3rd Style period'.

<accessRestrict> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.nameLike.label → <periodName>

**<persName>** Designation for an individual, including any or all of that individual's forenames, surnames, honorific titles, and added names.

<accessRestrict> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.nameLike → model.nameLike.agent → <persName>

**<postBox>** (postal box or post office box) contains a number or other identifier for some postal delivery point other than a street address.

<accessRestrict> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.addressPart → <postBox>

**<postCode>** (postal code) contains a numerical or alphanumeric code used as part of a postal address to simplify sorting or delivery of mail.

<accessRestrict> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.addressPart → <postCode>

**<ptr>** Defines a traversible pointer to another location, using only attributes to describe the destination.

<accessRestrict> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.locrefLike → <ptr>

**<q>** Contains material which is distinguished from the surrounding phrase-level text using quotation marks or a similar method. Use **<quote>** for block-level quotations.

<accessRestrict> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.qLike → <q>

**<ref>** Defines a traversible reference to another location. May contain text and sub-elements that describe the destination.

<accessRestrict> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.locrefLike → <ref>

**<region>** Contains the name of an administrative unit such as a state, province, or county, larger than a settlement, but smaller than a country.

<accessRestrict> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <region>

**<relation>** Describes a relationship or linkage amongst entities.

<accessRestrict> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.relationLike → <relation>

**<relationList>** Gathers relation elements.

<accessRestrict> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.relationLike → <relationList>

**<rend>** A formatting element indicating special visual rendering, e.g., bold or italicized, of a text word or phrase.

<accessRestrict> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.rendLike → <rend>

**<repository>** Institution, agency, or individual which holds a bibliographic item.

<accessRestrict> → macro.struc-

unstrucContent → model.textPhraseLike.limited → model.nameLike → model.nameLike.place → model.repositoryLike → <repository>

**<secFolio>** Marks the word or words taken from a fixed point in a codex (typically the beginning of the second leaf) in order to provide a unique identifier for the item.

<accessRestrict> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.mslinline → <secFolio>

**<seg>** (arbitrary segment) represents any segmentation of text below the "text component" level.

<accessRestrict> → macro.struc-unstrucContent → model.textPhraseLike.limited → <seg>

**<settlement>** Contains the name of a settlement such as a city, town, or village identified as a single geopolitical or administrative unit.

<accessRestrict> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <settlement>

**<signatures>** Provides a description of the leaf or quire signatures found within a codex.

<accessRestrict> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.mslinline → <signatures>

**<stack>** An inline table with a single column.

<accessRestrict> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.rendLike → <stack>

**<stamp>** Contains a word or phrase describing an official mark indicating ownership, genuineness, validity, etc.

<accessRestrict> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.mslinline → <stamp>

**<street>** full street address including any name or number identifying a building as well as the name of the street or route on which it is located.

<accessRestrict> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.addressPart → <street>

**<styleName>** A label for a characteristic style of writing or performance, such as 'bebop' or 'rock-n-roll'.

<accessRestrict> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.nameLike.label → <styleName>

**<symbol>** A reference to a previously defined symbol.

<accessRestrict> → macro.struc-unstrucContent → model.textPhraseLike.limited → <symbol>

**<term>** Keyword or phrase which describes a resource.

<accessRestrict> → macro.struc-unstrucContent → model.textPhraseLike.limited → <term>

**<title>** Title of a bibliographic entity.

<accessRestrict> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.titleLike → <title>

**<watermark>** Contains a description of a watermark or similar device.

<accessRestrict> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.mslinline → <watermark>

**<width>** Description of the horizontal size of an object.

<accessRestrict> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.dimLike → <width>

## Remarks

May indicate the nature of restrictions or the lack of restrictions. Do not confuse this element with <useRestrict> (usage restrictions), which captures information about limitations on the **use** of material, such as those afforded by copyright.

The model of this element is based on the `accessrestrict` element of the Encoded Archival Description (EAD).

## Declaration

VERSION

## <accid>

(accidental) – Records a temporary alteration to the pitch of a note.

### Referenced in chapters

[2.2.4.3 Accidentals, Articulation Symbols, Augmentation Dots, and Custos Signs](#)

### Module

[MEI.shared](#)

### Attributes

**@accid** (*optional*) Captures a written accidental. Value conforms to [data.ACCIDENTAL.WRITTEN](#).

<accid> → att.accid.log → att.accidental → @accid

**@accid.ges** (*optional*) Records the performed pitch inflection. Value conforms to [data.ACCIDENTAL.GESTURAL](#).

<accid> → att.accid.ges → att.accidental.ges → @accid.ges

**@altsym** (*optional*) Provides a way of pointing to a user-defined symbol. It must contain a reference to an ID of a [symbolDef](#) element elsewhere in the document. Value conforms to [data.URI](#).

<accid> → att.accid.vis → att.altSym → @altsym

**@class** (*optional*) Contains one or more URIs which denote classification terms that apply to the entity bearing this attribute. One or more values from [data.URI](#), separated by spaces.

<accid> → att.common → att.typed → att.classed → @class

**@color** (*optional*) Used to indicate visual appearance. Do not confuse this with the musical term 'color' as used in pre-CMN notation. Value conforms to [data.COLOR](#).

<accid> → att.accid.vis → att.color → @color

**@copyof** (*optional*) Points to an element of which the current element is a copy. Value conforms to [data.URI](#).

<accid> → att.common → att.linking → @copyof

**@corresp** (*optional*) Used to point to other elements that correspond to this one in a generic fashion. One or more values from [data.URI](#), separated by spaces.

<accid> → att.common → att.linking → @corresp

**@enclose** (*optional*) Records the characters often used to mark accidentals, articulations, and sometimes notes as having a cautionary or editorial function. For an example of cautionary accidentals enclosed in parentheses, see Read, p. 131, ex. 9-14. Value conforms to [data.ENCLOSURE](#).

<accid> → att.accid.vis → att.enclosingChars → @enclose

**@evaluate** (*optional*) Specifies the intended meaning when a participant in a relationship is itself a pointer. Allowed values are: "**all**" (*If an element pointed to is itself a pointer, then the target of that pointer will be taken, and so on, until an element is found which is not a pointer.*), "**one**" (*If an element pointed to is itself a pointer, then its target (whether a pointer or not) is taken as the target of this pointer.*), "**none**" (*No further evaluation of targets is carried out beyond that needed to find the element(s) specified in plist or target attribute.*)

<accid> → att.accid.log → att.controlEvent → att.targetEval → @evaluate

**@facs** (*optional*) Points to one or more images, portions of an image, or surfaces which correspond to the current element. One or more values from [data.URI](#), separated by spaces.

<accid> → att.facsimile → @facs

**@follows** (*optional*) points to one or more events in a user-defined collection that are known to be predecessors of the current element. One or more values from [data.URI](#), separated by spaces.

<accid> → att.common → att.linking → @follows

**@fontfam** (*optional*) Contains the name of a font-family. Value conforms to [data.FONTFAMILY](#).

<accid> → att.accid.vis → att.typography → @fontfam

**@fontname** (*optional*) Holds the name of a font. Value conforms to [data.FONTNAME](#).

<accid> → att.accid.vis → att.typography → @fontname

**@fontsize** (*optional*) Indicates the size of a font expressed in printers' points, i.e., 1/72nd of an inch, relative terms, e.g., small, larger, etc., or percentage values relative to normal size, e.g., 125%. Value conforms to [data.FONTSIZE](#).

<accid> → att.accid.vis → att.typography → @fontsize

**@fontstyle** (*optional*) Records the style of a font, i.e., italic, oblique, or normal. Value conforms to [data.FONTSTYLE](#).

<accid> → att.accid.vis → att.typography → @fontstyle

**@fontweight** (*optional*) Used to indicate bold type. Value conforms to [data.FONTWEIGHT](#).

<accid> → att.accid.vis → att.typography → @fontweight

**@func** (*optional*) Records the function of an accidental. Allowed values are: "**caution**" (*Cautionary accidental.*), "**edit**" (*Editorial accidental.*)

<accid> → att.accid.log → @func

**@glyph.auth** (*optional*) A name or label associated with the controlled vocabulary from which the value of `glyph.name` or `glyph.num` is taken, or the textual content of the element. Allowed values are: "**smufl**" (*Standard Music Font Layout*.)

<accid> → att.accid.vis → att.extSym → att.extSym.auth → @glyph.auth

**@glyph.name** (*optional*) Glyph name. Value is plain text.

<accid> → att.accid.vis → att.extSym → att.extSym.names → @glyph.name

**@glyph.num** (*optional*) Numeric glyph reference in hexadecimal notation, e.g., "#xE000" or "U+E000".

N.B. SMuFL version 1.18 uses the range U+E000 - U+ECBF. Value conforms to [data.HEXNUM](#).

<accid> → att.accid.vis → att.extSym → att.extSym.names → @glyph.num

**@glyph.uri** (*optional*) The web-accessible location of the controlled vocabulary from which the value of `glyph.name` or `glyph.num` is taken, or the textual content of the element. Value conforms to [data.URI](#).

<accid> → att.accid.vis → att.extSym → att.extSym.auth → @glyph.uri

**@ho** (*optional*) Records a horizontal adjustment to a feature's programmatically-determined location in terms of staff interline distance; that is, in units of 1/2 the distance between adjacent staff lines. Value conforms to [data.MEASUREMENTSIGNED](#).

<accid> → att.accid.vis → att.visualOffset.ho → @ho

**@label** (*optional*) Captures text to be used to generate a label for the element to which it's attached, a "tool tip" or prefatory text, for example. Should not be used to record document content. Value is plain text.

<accid> → att.common → att.labelled → @label

**@layer** (*optional*) Identifies the layer to which a feature applies. One or more values of datatype **positiveInteger**, separated by spaces.

<accid> → att.accid.log → att.controlEvent → att.layerIdent → @layer

**@letterspacing** (*optional*) Indicates letter spacing (aka tracking) in analogy to the CSS letter-spacing property. Value conforms to [data.MEASUREMENTTYPGRAPHYSIGNED](#).

<accid> → att.accid.vis → att.typography → @letterspacing

**@lineheight** (*optional*) Indicates line height in analogy to the CSS line-height property. Value conforms to either [data.MEASUREMENTTYPGRAPHYUNSIGNED](#) or [data.PERCENT](#).

<accid> → att.accid.vis → att.typography → @lineheight

**@loc** (*optional*) Holds the staff location of the feature. Value conforms to [data.STAFFLOC](#).

<accid> → att.accid.vis → att.staffLoc → @loc

**@n** (*optional*) Provides a number-like designation that indicates an element's position in a sequence of similar elements. May not contain space characters. Value conforms to [data.WORD](#).

<accid> → att.common → att.nNumberLike → @n

**@next** (*optional*) Used to point to the next event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<accid> → att.common → att.linked → @next

**@oloc** (*optional*) Records staff location in terms of written octave. Value conforms to [data.OCTAVE](#).

<accid> → att.accid.vis → att.staffLoc.pitched → @oloc

**@onstaff** (*optional*) Indicates the placement of the item within the staff. A value of 'true' means on the staff, and 'false' off the staff. Value conforms to [data.BOOLEAN](#).

<accid> → att.accid.vis → att.placementOnStaff → @onstaff

**@part** (*optional*) Indicates the part in which the current feature should appear. Use '%all' when the feature should occur in every part. One or more values of datatype **a string matching the following regular expression: "(%all|#[\ni][\c]+)"**, separated by spaces.

<accid> → att.accid.log → att.controlEvent → att.partIdent → @part

**@partstaff** (*optional*) Signifies the part staff on which a notated feature occurs. Use '%all' when the feature should occur on every staff. One or more values of datatype **a string matching the following regular expression: "(%all|\d+(-\d+)?)"**, separated by spaces.

<accid> → att.accid.log → att.controlEvent → att.partIdent → @partstaff

**@place** (*optional*) Captures the placement of the item with respect to the event with which it is associated. Value conforms to [data.STAFFREL](#).

<accid> → att.accid.vis → att.placementRelEvent → @place

**@plist** (*optional*) When the target attribute is present, plist identifies the active participants; that is, those entities pointed "from", in a relationship with the specified target(s). When the target attribute is not present, it identifies participants in a mutual relationship. One or more values from [data.URI](#), separated by spaces.

<accid> → att.accid.log → att.controlEvent → att.plist → @plist

**@ploc** (*optional*) Captures staff location in terms of written pitch name. Value conforms to [data.PITCHNAME](#).

<accid> → att.accid.vis → att.staffLoc.pitched → @ploc

**@precedes** (*optional*) Points to one or more events in a user-defined collection that are known to be successors of the current element. One or more values from [data.URI](#), separated by spaces.

<accid> → att.common → att.linked → @precedes

**@prev** (*optional*) Points to the previous event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<accid> → [att.common](#) → [att.linking](#) → @prev

**@resp** (*optional*) Indicates the agent(s) responsible for some aspect of the text's transcription, editing, or encoding. Its value must point to one or more identifiers declared in the document header. One or more values from [data.URI](#), separated by spaces.

<accid> → [att.common](#) → [att.responsibility](#) → @resp

**@sameas** (*optional*) Points to an element that is the same as the current element but is not a literal copy of the current element. One or more values from [data.URI](#), separated by spaces.

<accid> → [att.common](#) → [att.linking](#) → @sameas

**@staff** (*recommended*) Signifies the staff on which a notated event occurs or to which a control event applies. Mandatory when applicable. One or more values of datatype **positiveInteger**, separated by spaces.

<accid> → [att.accid.log](#) → [att.controlEvent](#) → [att.staffIdent](#) → @staff

**@synch** (*optional*) Points to elements that are synchronous with the current element. One or more values from [data.URI](#), separated by spaces.

<accid> → [att.common](#) → [att.linking](#) → @synch

**@tstamp** (*optional*) Encodes the onset time in terms of musical time, i.e., beats[.fractional beat part], as expressed in the written time signature. Value conforms to [data.BEAT](#).

<accid> → [att.accid.log](#) → [att.controlEvent](#) → [att.timestamp.log](#) → @tstamp

**@tstamp.ges** (*optional*) Encodes the onset time in terms of musical time, i.e., beats[.fractional beat part], as expressed in the written time signature. Value conforms to [data.BEAT](#).

<accid> → [att.accid.log](#) → [att.controlEvent](#) → [att.timestamp.ges](#) → @tstamp.ges

**@tstamp.real** (*optional*) Records the onset time in terms of ISO time. Value conforms to [data.ISOTIME](#).

<accid> → [att.accid.log](#) → [att.controlEvent](#) → [att.timestamp.ges](#) → @tstamp.real

**@type** (*optional*) Designation which characterizes the element in some sense, using any convenient classification scheme or typology that employs single-token labels. One or more values of datatype **NMTOKEN**, separated by spaces.

<accid> → [att.common](#) → [att.typed](#) → @type

**@vo** (*optional*) Records the vertical adjustment of a feature's programmatically-determined location in terms of staff interline distance; that is, in units of 1/2 the distance between adjacent staff lines. Value conforms to [data.MEASUREMENTSIGNED](#).

<accid> → [att.accid.vis](#) → [att.visualOffset.vo](#) → @vo

**@when** (*optional*) Indicates the point of occurrence of this feature along a time line. Its value must be the ID of a [<when>](#) element elsewhere in the document. Value conforms to [data.URI](#).

<accid> → [att.accid.log](#) → [att.controlEvent](#) → [att.alignment](#) → @when

**@x** (*optional*) Encodes an x coordinate for a feature in an output coordinate system. When it is necessary to record the placement of a feature in a facsimile image, use the [facs](#) attribute. Value is a decimal number.

<accid> → [att.accid.vis](#) → [att.xy](#) → @x

**@xml:base** (*optional*) Provides a base URI reference with which applications can resolve relative URI references into absolute URI references. Value conforms to [data.URI](#).

<accid> → att.common → att.basic → @xml:base

**@xml:id** (*optional*) Regularizes the naming of an element and thus facilitates building links between it and other resources. Each id attribute within a document must have a unique value. Value is a valid xml:id.

<accid> → att.common → att.basic → att.id → @xml:id

**@y** (*optional*) Encodes a y coordinate for a feature in an output coordinate system. When it is necessary to record the placement of a feature in a facsimile image, use the facets attribute. Value is a decimal number.

<accid> → att.accid.vis → att.xy → @y

## Member of

model.noteModifierLike Groups elements that modify note-like features.

model.syllablePart Groups elements that may appear as part of the content of a syllable.

## Contained By

**<abbr>** A generic element for 1) a shortened form of a word, including an acronym or 2) a shorthand notation.

<accid> → model.noteModifierLike → model.layerPart.mensuralAndNeumes → model.layerPart → <abbr>

**<add>** Marks an addition to the text.

<accid> → model.noteModifierLike → model.layerPart.mensuralAndNeumes → model.layerPart → <add>

**<corr>** Contains the correct form of an apparent erroneous passage.

<accid> → model.noteModifierLike → model.layerPart.mensuralAndNeumes → model.layerPart → <corr>

**<custos>** Symbol placed at the end of a line of music to indicate the first note of the next line. Sometimes called a "direct".

<accid> → elements having accid as direct children → <custos>

**<damage>** Contains an area of damage to the physical medium.

<accid> → model.noteModifierLike → model.layerPart.mensuralAndNeumes → model.layerPart → <damage>

**<del>** Contains information deleted, marked as deleted, or otherwise indicated as superfluous or spurious in the copy text by an author, scribe, annotator, or corrector.

<accid> → model.noteModifierLike → model.layerPart.mensuralAndNeumes → model.layerPart → <del>

**<expan>** Contains the expansion of an abbreviation.

<accid> → model.noteModifierLike → model.layerPart.mensuralAndNeumes → model.layerPart → <expan>

**<layer>** An independent stream of events on a staff.

<accid> → model.noteModifierLike → model.layerPart.mensuralAndNeumes → model.layerPart → <layer>

**<lem>** (lemma) – Contains the lemma, or base text, of a textual variation.

<accid> → model.noteModifierLike → model.layerPart.mensuralAndNeumes → model.layerPart → <lem>

**<note>** A single pitched event.

<accid> → model.noteModifierLike → <note>

**<oLayer>** A layer that contains an alternative to material in another layer.

<accid> → model.noteModifierLike → model.layerPart.mensuralAndNeumes → model.layerPart → <oLayer>

**<orig>** Contains material which is marked as following the original, rather than being normalized or corrected.

<accid> → model.noteModifierLike → model.layerPart.mensuralAndNeumes → model.layerPart → <orig>

**<rdg>** (reading) – Contains a single reading within a textual variation.

<accid> → model.noteModifierLike → model.layerPart.mensuralAndNeumes → model.layerPart → <rdg>

**<reg>** Contains material which has been regularized or normalized in some sense.

<accid> → model.noteModifierLike → model.layerPart.mensuralAndNeumes → model.layerPart → <reg>

**<restore>** Indicates restoration of material to an earlier state by cancellation of an editorial or authorial marking or instruction.

<accid> → model.noteModifierLike → model.layerPart.mensuralAndNeumes → model.layerPart → <restore>

**<sic>** Contains apparently incorrect or inaccurate material.

<accid> → model.noteModifierLike → model.layerPart.mensuralAndNeumes → model.layerPart → <sic>

**<supplied>** Contains material supplied by the transcriber or editor for any reason.

<accid> → model.noteModifierLike → model.layerPart.mensuralAndNeumes → model.layerPart → <supplied>

**<syllable>** Neume notation can be thought of as "neumed text". Therefore, the syllable element provides high-level organization in this repertoire.

<accid> → model.syllablePart → <syllable>

**<unclear>** Contains material that cannot be transcribed with certainty because it is illegible or inaudible in the source.

<accid> → model.noteModifierLike → model.layerPart.mensuralAndNeumes → model.layerPart → <unclear>

## May Contain

– (<accid> may not have child elements)

## Remarks

An accidental may raise a pitch by one or two semitones or it may cancel a previous accidental or part of a key signature. This element provides an alternative to the accid and accid.ges attributes on the <note> element. The element may be used when specific display info, such as size or color, needs to be recorded for the accidental or when multiple accidentals occur on a single note. The func attribute can be used to differentiate between the accidental's functions, such as 'cautionary' or 'editorial'.

## Declaration

```
<elementSpec ident="accid" module="MEI.shared">

```

## <acquisition>

Records information concerning the process by which an item was acquired by the holding institution.

### Module

[MEI.header](#)

### Attributes

**@analog** (*optional*) Contains a reference to a field or element in another descriptive encoding system to which this MEI element is comparable. Value is plain text.

<acquisition> → [att.bibl](#) → @analog

**@class** (*optional*) Contains one or more URIs which denote classification terms that apply to the entity bearing this attribute. One or more values from [data.URI](#), separated by spaces.

<acquisition> → [att.common](#) → [att.typed](#) → [att.classed](#) → @class

**@copyof** (*optional*) Points to an element of which the current element is a copy. Value conforms to [data.URI](#).

<acquisition> → [att.common](#) → [att.linkin](#) → @copyof

**@corresp** (*optional*) Used to point to other elements that correspond to this one in a generic fashion. One or more values from [data.URI](#), separated by spaces.

<acquisition> → [att.common](#) → [att.linkin](#) → @corresp

**@enddate** (*optional*) Contains the end point of a date range in standard ISO form. Value conforms to [data.ISODATE](#).

<acquisition> → [att.datable](#) → @enddate

**@follows** (*optional*) points to one or more events in a user-defined collection that are known to be predecessors of the current element. One or more values from [data.URI](#), separated by spaces.

<acquisition> → [att.common](#) → [att.linkin](#) → @follows

**@isodate** (*optional*) Provides the value of a textual date in standard ISO form. Value conforms to [data.ISODATE](#).

<acquisition> → [att.datable](#) → @isodate

**@label** (*optional*) Captures text to be used to generate a label for the element to which it's attached, a "tool tip" or prefatory text, for example. Should not be used to record document content. Value is plain text.

<acquisition> → [att.common](#) → [att.labelled](#) → @label

**@on** (*optional*) Provides a number-like designation that indicates an element's position in a sequence of similar elements. May not contain space characters. Value conforms to [data.WORD](#).

<acquisition> → [att.common](#) → [att.nNumberLike](#) → @on

**@next** (*optional*) Used to point to the next event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<acquisition> → [att.common](#) → [att.linkin](#) → @next

**@notafter** (*optional*) Contains an upper boundary for an uncertain date in standard ISO form. Value conforms to [data.ISODATE](#).

<acquisition> → [att.datable](#) → @notafter

**@notbefore** (*optional*) Contains a lower boundary, in standard ISO form, for an uncertain date. Value conforms to [data.ISODATE](#).

<acquisition> → att.datable → @notbefore

**@precedes** (*optional*) Points to one or more events in a user-defined collection that are known to be successors of the current element. One or more values from [data.URI](#), separated by spaces.

<acquisition> → att.common → att.linking → @precedes

**@prev** (*optional*) Points to the previous event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<acquisition> → att.common → att.linking → @prev

**@resp** (*optional*) Indicates the agent(s) responsible for some aspect of the text's transcription, editing, or encoding. Its value must point to one or more identifiers declared in the document header. One or more values from [data.URI](#), separated by spaces.

<acquisition> → att.common → att.responsibility → @resp

**@sameas** (*optional*) Points to an element that is the same as the current element but is not a literal copy of the current element. One or more values from [data.URI](#), separated by spaces.

<acquisition> → att.common → att.linking → @sameas

**@startdate** (*optional*) Contains the starting point of a date range in standard ISO form. Value conforms to [data.ISODATE](#).

<acquisition> → att.datable → @startdate

**@synch** (*optional*) Points to elements that are synchronous with the current element. One or more values from [data.URI](#), separated by spaces.

<acquisition> → att.common → att.linking → @synch

**@translit** (*optional*) Specifies the transliteration technique used. Value is a [NMTOKEN](#).

<acquisition> → att.lang → @translit

**@type** (*optional*) Designation which characterizes the element in some sense, using any convenient classification scheme or typology that employs single-token labels. One or more values of datatype [NMTOKEN](#), separated by spaces.

<acquisition> → att.common → att.typed → @type

**@xml:base** (*optional*) Provides a base URI reference with which applications can resolve relative URI references into absolute URI references. Value conforms to [data.URI](#).

<acquisition> → att.common → att.basic → @xml:base

**@xml:id** (*optional*) Regularizes the naming of an element and thus facilitates building links between it and other resources. Each id attribute within a document must have a unique value. Value is a valid [xml:id](#).

<acquisition> → att.common → att.basic → att.id → @xml:id

**@xml:lang** (*optional*) Identifies the language of the element's content. The values for this attribute are language 'tags' as defined in BCP 47. All language tags that make use of private use sub-tags must be documented in a corresponding language element in the MEI header whose id attribute is the same as the language tag's value. Value is a [language](#).

<acquisition> → att.lang → @xml:lang

## Member of

(acquisition isn't member of any model class)

**Contained By**

**<history>** Provides a container for information about the history of a resource other than the circumstances of its creation.  
<acquisition> → elements having acquisition as direct children → <history>

**May Contain**

**<abbr>** A generic element for 1) a shortened form of a word, including an acronym or 2) a shorthand notation.  
<acquisition> → model.textPhraseLike.limited → model.editorialLike → <abbr>

**<address>** Contains a postal address, for example of a publisher, an organization, or an individual.  
<acquisition> → model.textPhraseLike.limited → model.addressLike → <address>

**<annot>** Provides a statement explaining the text or indicating the basis for an assertion.  
<acquisition> → model.textPhraseLike.limited → model.annotLike → <annot>

**<bibl>** Provides a loosely-structured bibliographic citation in which the sub-components may or may not be explicitly marked.  
<acquisition> → model.textPhraseLike.limited → model.biblLike → <bibl>

**<biblStruct>** Contains a bibliographic citation in which bibliographic sub-elements must appear in a specified order.  
<acquisition> → model.textPhraseLike.limited → model.biblLike → <biblStruct>

**<bloc>** Contains the name of a geopolitical unit consisting of two or more nation states or countries.  
<acquisition> → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <bloc>

**<catchwords>** Describes the system used to ensure correct ordering of the quires making up an item, typically by means of annotations at the foot of the page.  
<acquisition> → model.textPhraseLike.limited → model.msInline → <catchwords>

**<corpName>** Identifies an organization or group of people that acts as a single entity.  
<acquisition> → model.textPhraseLike.limited → model.nameLike → model.nameLike.agent → <corpName>

**<country>** Contains the name of a geopolitical unit, such as a nation, country, colony, or commonwealth, larger than or administratively superior to a region and smaller than a bloc.  
<acquisition> → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <country>

**<date>** A string identifying a point in time or the time period between two such points.  
<acquisition> → model.textPhraseLike.limited → model.dateLike → <date>

**<dedicatee>** Entity to whom a creative work is formally offered.  
<acquisition> → model.textPhraseLike.limited → <dedicatee>

**<depth>** Description of a measurement taken through a three-dimensional object.  
<acquisition> → model.textPhraseLike.limited → model.dimLike → <depth>

**<dim>** Any single dimensional specification.  
<acquisition> → model.textPhraseLike.limited → model.dimLike → <dim>

**<dimensions>** Information about the physical size of an entity; usually includes numerical data.  
<acquisition> → model.textPhraseLike.limited → <dimensions>

**<district>** Contains the name of any kind of subdivision of a settlement, such as a parish, ward, or other administrative or geographic unit.  
<acquisition> → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <district>

**<eventList>** Contains historical information given as a sequence of significant past events.

<acquisition> → direct children → <eventList>

**<expan>** Contains the expansion of an abbreviation.

<acquisition> → model.textPhraseLike.limited → model.editorialLike → <expan>

**<extent>** Used to express size in terms other than physical dimensions, such as number of pages, records, bytes, physical components, etc.

<acquisition> → model.textPhraseLike.limited → <extent>

**<fig>** Groups elements representing or containing graphic information such as an illustration or figure.

<acquisition> → model.textPhraseLike.limited → model.figureLike → <fig>

**<geogFeat>** Contains a common noun identifying a geographical feature.

<acquisition> → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <geogFeat>

**<geogName>** The proper noun designation for a place, natural feature, or political jurisdiction.

<acquisition> → model.textPhraseLike.limited → model.nameLike → model.nameLike.place → model.nameLike.geogName → <geogName>

**<head>** Contains any heading, for example, the title of a section of text, or the heading of a list.

<acquisition> → model.headLike → <head>

**<height>** Description of the vertical size of an object.

<acquisition> → model.textPhraseLike.limited → model.dimLike → <height>

**<heraldry>** Contains a heraldic formula or phrase, typically found as part of a blazon, coat of arms, etc.

<acquisition> → model.textPhraseLike.limited → model.msInline → <heraldry>

**<identifier>** An alpha-numeric string that establishes the identity of the described material.

<acquisition> → model.textPhraseLike.limited → model.identifierLike → <identifier>

**<lb>** An empty formatting element that forces text to begin on a new line.

<acquisition> → model.textPhraseLike.limited → model.lbLike → <lb>

**<locus>** Defines a location within a manuscript or manuscript component, usually as a (possibly discontinuous) sequence of folio references.

<acquisition> → model.textPhraseLike.limited → model.msInline → <locus>

**<locusGrp>** Groups locations which together form a distinct but discontinuous item within a manuscript or manuscript part, according to a specific foliation.

<acquisition> → model.textPhraseLike.limited → model.msInline → <locusGrp>

**<name>** Proper noun or noun phrase.

<acquisition> → model.textPhraseLike.limited → model.nameLike → <name>

**<num>** Numeric information in any form.

<acquisition> → model.textPhraseLike.limited → model.measurementLike → model.numLike → <num>

**<p>** One or more text phrases that form a logical prose passage.

<acquisition> → model.pLike → <p>

**<periodName>** A label that describes a period of time, such as 'Baroque' or '3rd Style period'.

<acquisition> → model.textPhraseLike.limited → model.nameLike.label → <periodName>

**<persName>** Designation for an individual, including any or all of that individual's forenames, surnames, honorific titles, and added names.

<acquisition> → model.textPhraseLike.limited → model.nameLike → model.nameLike.agent → <persName>

**<postBox>** (postal box or post office box) contains a number or other identifier for some postal delivery point other than a street address.

<acquisition> → model.textPhraseLike.limited → model.addressPart → <postBox>

**<postCode>** (postal code) contains a numerical or alphanumeric code used as part of a postal address to simplify sorting or delivery of mail.

<acquisition> → model.textPhraseLike.limited → model.addressPart → <postCode>

**<ptr>** Defines a traversible pointer to another location, using only attributes to describe the destination.

<acquisition> → model.textPhraseLike.limited → model.locrefLike → <ptr>

**<q>** Contains material which is distinguished from the surrounding phrase-level text using quotation marks or a similar method. Use **<quote>** for block-level quotations.

<acquisition> → model.textPhraseLike.limited → model.qLike → <q>

**<ref>** Defines a traversible reference to another location. May contain text and sub-elements that describe the destination.

<acquisition> → model.textPhraseLike.limited → model.locrefLike → <ref>

**<region>** Contains the name of an administrative unit such as a state, province, or county, larger than a settlement, but smaller than a country.

<acquisition> → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <region>

**<relation>** Describes a relationship or linkage amongst entities.

<acquisition> → model.textPhraseLike.limited → model.relationLike → <relation>

**<relationList>** Gathers relation elements.

<acquisition> → model.textPhraseLike.limited → model.relationLike → <relationList>

**<rend>** A formatting element indicating special visual rendering, e.g., bold or italicized, of a text word or phrase.

<acquisition> → model.textPhraseLike.limited → model.rendLike → <rend>

**<repository>** Institution, agency, or individual which holds a bibliographic item.

<acquisition> → model.textPhraseLike.limited → model.nameLike → model.nameLike.place → model.repositoryLike → <repository>

**<secFolio>** Marks the word or words taken from a fixed point in a codex (typically the beginning of the second leaf) in order to provide a unique identifier for the item.

<acquisition> → model.textPhraseLike.limited → model.msInline → <secFolio>

**<seg>** (arbitrary segment) represents any segmentation of text below the "text component" level.

<acquisition> → model.textPhraseLike.limited → <seg>

**<settlement>** Contains the name of a settlement such as a city, town, or village identified as a single geopolitical or administrative unit.

<acquisition> → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <settlement>

**<signatures>** Provides a description of the leaf or quire signatures found within a codex.

<acquisition> → model.textPhraseLike.limited → model.msInline → <signatures>

**<stack>** An inline table with a single column.

<acquisition> → model.textPhraseLike.limited → model.rendLike → <stack>

**<stamp>** Contains a word or phrase describing an official mark indicating ownership, genuineness, validity, etc.

<acquisition> → model.textPhraseLike.limited → model.msInline → <stamp>

**<street>** full street address including any name or number identifying a building as well as the name of the street or route on which it is located.

<acquisition> → model.textPhraseLike.limited → model.addressPart → <street>

**<styleName>** A label for a characteristic style of writing or performance, such as 'bebop' or 'rock-n-roll'.

<acquisition> → model.textPhraseLike.limited → model.nameLike.label → <styleName>

**<symbol>** A reference to a previously defined symbol.

<acquisition> → model.textPhraseLike.limited → <symbol>

**<term>** Keyword or phrase which describes a resource.

<acquisition> → model.textPhraseLike.limited → <term>

**<title>** Title of a bibliographic entity.

<acquisition> → model.textPhraseLike.limited → model.titleLike → <title>

**<watermark>** Contains a description of a watermark or similar device.

<acquisition> → model.textPhraseLike.limited → model.msInline → <watermark>

**<width>** Description of the horizontal size of an object.

<acquisition> → model.textPhraseLike.limited → model.dimLike → <width>

## Remarks

The model of this element is based on the [acquisition](#) element of the Text Encoding Initiative (TEI).

## <actor>

Name of an actor appearing within a cast list.

### Referenced in chapters

[3.6.7.1 Cast Lists](#)

### Module

[MEI.shared](#)

### Attributes

**@class** (*optional*) Contains one or more URIs which denote classification terms that apply to the entity bearing this attribute. One or more values from [data.URI](#), separated by spaces.

<actor> → [att.common](#) → [att.typed](#) → [att.classed](#) → @class

**@copyof** (*optional*) Points to an element of which the current element is a copy. Value conforms to [data.URI](#).

<actor> → [att.common](#) → [att.linking](#) → @copyof

**@corresp** (*optional*) Used to point to other elements that correspond to this one in a generic fashion. One or more values from [data.URI](#), separated by spaces.

<actor> → [att.common](#) → [att.linking](#) → @corresp

**@facs** (*optional*) Points to one or more images, portions of an image, or surfaces which correspond to the current element. One or more values from [data.URI](#), separated by spaces.

<actor> → [att.facsimile](#) → @facs

**@follows** (*optional*) points to one or more events in a user-defined collection that are known to be predecessors of the current element. One or more values from [data.URI](#), separated by spaces.

<actor> → [att.common](#) → [att.linking](#) → @follows

**@label** (*optional*) Captures text to be used to generate a label for the element to which it's attached, a "tool tip" or prefatory text, for example. Should not be used to record document content. Value is plain text.

<actor> → [att.common](#) → [att.labelled](#) → @label

**@n** (*optional*) Provides a number-like designation that indicates an element's position in a sequence of similar elements. May not contain space characters. Value conforms to [data.WORD](#).

<actor> → [att.common](#) → [att.nNumberLike](#) → @n

**@next** (*optional*) Used to point to the next event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<actor> → [att.common](#) → [att.linking](#) → @next

**@precedes** (*optional*) Points to one or more events in a user-defined collection that are known to be successors of the current element. One or more values from [data.URI](#), separated by spaces.

<actor> → [att.common](#) → [att.linking](#) → @precedes

**@prev** (*optional*) Points to the previous event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<actor> → [att.common](#) → [att.linking](#) → @prev

**@resp** (*optional*) Indicates the agent(s) responsible for some aspect of the text's transcription, editing, or encoding. Its value must point to one or more identifiers declared in the document header. One or more values from [data.URI](#), separated by spaces.

<actor> → [att.common](#) → [att.responsibility](#) → @resp

**@sameas** (*optional*) Points to an element that is the same as the current element but is not a literal copy of the current element. One or more values from [data.URI](#), separated by spaces.

<actor> → [att.common](#) → [att.linking](#) → @sameas

**@synch** (*optional*) Points to elements that are synchronous with the current element. One or more values from [data.URI](#), separated by spaces.

<actor> → [att.common](#) → [att.linking](#) → @synch

**@translit** (*optional*) Specifies the transliteration technique used. Value is a [NMOKEN](#).

<actor> → [att.lang](#) → @translit

**@type** (*optional*) Designation which characterizes the element in some sense, using any convenient classification scheme or typology that employs single-token labels. One or more values of datatype [NMOKEN](#), separated by spaces.

<actor> → [att.common](#) → [att.typed](#) → @type

**@xml:base** (*optional*) Provides a base URI reference with which applications can resolve relative URI references into absolute URI references. Value conforms to [data.URI](#).

<actor> → [att.common](#) → [att.basic](#) → @xml:base

**@xml:id** (*optional*) Regularizes the naming of an element and thus facilitates building links between it and other resources. Each id attribute within a document must have a unique value. Value is a valid [xml:id](#).

<actor> → [att.common](#) → [att.basic](#) → [att.id](#) → @xml:id

**@xml:lang** (*optional*) Identifies the language of the element's content. The values for this attribute are language 'tags' as defined in BCP 47. All language tags that make use of private use sub-tags must be documented in a corresponding language element in the MEI header whose id attribute is the same as the language tag's value. Value is a [language](#).

<actor> → [att.lang](#) → @xml:lang

## Member of

(actor isn't member of any model class)

## Contained By

**<castItem>** Contains a single entry within a cast list, describing either a single role or a list of non-speaking roles.

<actor> → elements having actor as direct children → <castItem>

## May Contain

**<abbr>** A generic element for 1) a shortened form of a word, including an acronym or 2) a shorthand notation.

<actor> → [model.textPhraseLike.limited](#) → [model.editorialLike](#) → <abbr>

**<address>** Contains a postal address, for example of a publisher, an organization, or an individual.

<actor> → [model.textPhraseLike.limited](#) → [model.addressLike](#) → <address>

**<annot>** Provides a statement explaining the text or indicating the basis for an assertion.

<actor> → model.textPhraseLike.limited → model.annotLike → <annot>

**<bibl>** Provides a loosely-structured bibliographic citation in which the sub-components may or may not be explicitly marked.

<actor> → model.textPhraseLike.limited → model.biblLike → <bibl>

**<biblStruct>** Contains a bibliographic citation in which bibliographic sub-elements must appear in a specified order.

<actor> → model.textPhraseLike.limited → model.biblLike → <biblStruct>

**<bloc>** Contains the name of a geopolitical unit consisting of two or more nation states or countries.

<actor> → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <bloc>

**<catchwords>** Describes the system used to ensure correct ordering of the quires making up an item, typically by means of annotations at the foot of the page.

<actor> → model.textPhraseLike.limited → model.mslInLine → <catchwords>

**<corpName>** Identifies an organization or group of people that acts as a single entity.

<actor> → model.textPhraseLike.limited → model.nameLike → model.nameLike.agent → <corpName>

**<country>** Contains the name of a geopolitical unit, such as a nation, country, colony, or commonwealth, larger than or administratively superior to a region and smaller than a bloc.

<actor> → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <country>

**<date>** A string identifying a point in time or the time period between two such points.

<actor> → model.textPhraseLike.limited → model.dateLike → <date>

**<dedicatee>** Entity to whom a creative work is formally offered.

<actor> → model.textPhraseLike.limited → <dedicatee>

**<depth>** Description of a measurement taken through a three-dimensional object.

<actor> → model.textPhraseLike.limited → model.dimLike → <depth>

**<dim>** Any single dimensional specification.

<actor> → model.textPhraseLike.limited → model.dimLike → <dim>

**<dimensions>** Information about the physical size of an entity; usually includes numerical data.

<actor> → model.textPhraseLike.limited → <dimensions>

**<district>** Contains the name of any kind of subdivision of a settlement, such as a parish, ward, or other administrative or geographic unit.

<actor> → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <district>

**<expan>** Contains the expansion of an abbreviation.

<actor> → model.textPhraseLike.limited → model.editorialLike → <expan>

**<extent>** Used to express size in terms other than physical dimensions, such as number of pages, records, bytes, physical components, etc.

<actor> → model.textPhraseLike.limited → <extent>

**<fig>** Groups elements representing or containing graphic information such as an illustration or figure.

<actor> → model.textPhraseLike.limited → model.figureLike → <fig>

**<geogFeat>** Contains a common noun identifying a geographical feature.

<actor> → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <geogFeat>

**<geogName>** The proper noun designation for a place, natural feature, or political jurisdiction.

<actor> → model.textPhraseLike.limited → model.nameLike → model.nameLike.place → model.nameLike.geogName → <geogName>

**<height>** Description of the vertical size of an object.

<actor> → model.textPhraseLike.limited → model.dimLike → <height>

**<heraldry>** Contains a heraldic formula or phrase, typically found as part of a blazon, coat of arms, etc.

<actor> → model.textPhraseLike.limited → model.mslinline → <heraldry>

**<identifier>** An alpha-numeric string that establishes the identity of the described material.

<actor> → model.textPhraseLike.limited → model.identifierLike → <identifier>

**<lb>** An empty formatting element that forces text to begin on a new line.

<actor> → model.textPhraseLike.limited → model.lbLike → <lb>

**<locus>** Defines a location within a manuscript or manuscript component, usually as a (possibly discontinuous) sequence of folio references.

<actor> → model.textPhraseLike.limited → model.mslinline → <locus>

**<locusGrp>** Groups locations which together form a distinct but discontinuous item within a manuscript or manuscript part, according to a specific foliation.

<actor> → model.textPhraseLike.limited → model.mslinline → <locusGrp>

**<name>** Proper noun or noun phrase.

<actor> → model.textPhraseLike.limited → model.nameLike → <name>

**<num>** Numeric information in any form.

<actor> → model.textPhraseLike.limited → model.measurementLike → model.numLike → <num>

**<periodName>** A label that describes a period of time, such as 'Baroque' or '3rd Style period'.

<actor> → model.textPhraseLike.limited → model.nameLike.label → <periodName>

**<persName>** Designation for an individual, including any or all of that individual's forenames, surnames, honorific titles, and added names.

<actor> → model.textPhraseLike.limited → model.nameLike → model.nameLike.agent → <persName>

**<postBox>** (postal box or post office box) contains a number or other identifier for some postal delivery point other than a street address.

<actor> → model.textPhraseLike.limited → model.addressPart → <postBox>

**<postCode>** (postal code) contains a numerical or alphanumeric code used as part of a postal address to simplify sorting or delivery of mail.

<actor> → model.textPhraseLike.limited → model.addressPart → <postCode>

**<ptr>** Defines a traversible pointer to another location, using only attributes to describe the destination.

<actor> → model.textPhraseLike.limited → model.locrefLike → <ptr>

**<q>** Contains material which is distinguished from the surrounding phrase-level text using quotation marks or a similar method. Use <quote> for block-level quotations.

<actor> → model.textPhraseLike.limited → model.qLike → <q>

**<ref>** Defines a traversible reference to another location. May contain text and sub-elements that describe the destination.

<actor> → model.textPhraseLike.limited → model.locrefLike → <ref>

**<region>** Contains the name of an administrative unit such as a state, province, or county, larger than a settlement, but smaller than a country.

<actor> → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <region>

**<relation>** Describes a relationship or linkage amongst entities.

<actor> → model.textPhraseLike.limited → model.relationLike → <relation>

**<relationList>** Gathers relation elements.

<actor> → model.textPhraseLike.limited → model.relationLike → <relationList>

**<rend>** A formatting element indicating special visual rendering, e.g., bold or italicized, of a text word or phrase.

<actor> → model.textPhraseLike.limited → model.rendLike → <rend>

**<repository>** Institution, agency, or individual which holds a bibliographic item.

<actor> → model.textPhraseLike.limited → model.nameLike → model.nameLike.place → model.repositoryLike → <repository>

**<secFolio>** Marks the word or words taken from a fixed point in a codex (typically the beginning of the second leaf) in order to provide a unique identifier for the item.

<actor> → model.textPhraseLike.limited → model.mslinline → <secFolio>

**<seg>** (arbitrary segment) represents any segmentation of text below the "text component" level.

<actor> → model.textPhraseLike.limited → <seg>

**<settlement>** Contains the name of a settlement such as a city, town, or village identified as a single geopolitical or administrative unit.

<actor> → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <settlement>

**<signatures>** Provides a description of the leaf or quire signatures found within a codex.

<actor> → model.textPhraseLike.limited → model.mslinline → <signatures>

**<stack>** An inline table with a single column.

<actor> → model.textPhraseLike.limited → model.rendLike → <stack>

**<stamp>** Contains a word or phrase describing an official mark indicating ownership, genuineness, validity, etc.

<actor> → model.textPhraseLike.limited → model.mslinline → <stamp>

**<street>** full street address including any name or number identifying a building as well as the name of the street or route on which it is located.

<actor> → model.textPhraseLike.limited → model.addressPart → <street>

**<styleName>** A label for a characteristic style of writing or performance, such as 'bebop' or 'rock-n-roll'.

<actor> → model.textPhraseLike.limited → model.nameLike.label → <styleName>

**<symbol>** A reference to a previously defined symbol.

<actor> → model.textPhraseLike.limited → <symbol>

**<term>** Keyword or phrase which describes a resource.

<actor> → model.textPhraseLike.limited → <term>

**<title>** Title of a bibliographic entity.

<actor> → model.textPhraseLike.limited → model.titleLike → <title>

**<watermark>** Contains a description of a watermark or similar device.

<actor> → model.textPhraseLike.limited → model.mslinline → <watermark>

**<width>** Description of the horizontal size of an object.

<actor> → model.textPhraseLike.limited → model.dimLike → <width>

## Remarks

The model of this element is based on the [actor](#) element of the Text Encoding Initiative (TEI).

[11.2.4.3 Substitutions, Restorations, and Handshifts](#), [11.3.2 Referencing Genetic States](#), [11.3.4 Genetic Changes at the Page Level](#)

### Module

[MEI.edittrans](#)

### Attributes

**@atleast** (*optional*) Gives a minimum estimated value for an approximate measurement. Value is a decimal number.

<add> → att.extent → att.ranging → @atleast

**@atmost** (*optional*) Gives a maximum estimated value for an approximate measurement. Value is a decimal number.

<add> → att.extent → att.ranging → @atmost

**@cert** (*optional*) Signifies the degree of certainty or precision associated with a feature. Value conforms to [data.CERTAINTY](#).

<add> → att.edit → att.evidence → @cert

**@class** (*optional*) Contains one or more URIs which denote classification terms that apply to the entity bearing this attribute. One or more values from [data.URI](#), separated by spaces.

<add> → att.common → att.typed → att.classed → @class

**@confidence** (*optional*) Specifies the degree of statistical confidence (between zero and one) that a value falls within the range specified by min and max, or the proportion of observed values that fall within that range. Value conforms to [data.CONFIDENCE](#).

<add> → att.extent → att.ranging → @confidence

**@copyof** (*optional*) Points to an element of which the current element is a copy. Value conforms to [data.URI](#).

<add> → att.common → att.linkin → @copyof

**@corresp** (*optional*) Used to point to other elements that correspond to this one in a generic fashion. One or more values from [data.URI](#), separated by spaces.

<add> → att.common → att.linkin → @corresp

**@decls** (*optional*) Identifies one or more metadata elements (other than classification terms) within the header, which are understood to apply to the element bearing this attribute and its content. One or more values from [data.URI](#), separated by spaces.

<add> → att.trans → att.metadataPointing → @decls

**@evidence** (*optional*) Indicates the nature of the evidence supporting the reliability or accuracy of the intervention or interpretation. Allowed values are: "**internal**" (*There is evidence within the document to support the intervention.*), "**external**" (*There is evidence outside the document to support the intervention.*), "**conjecture**" (*The assertion has been made by the editor, cataloguer, or scholar on the basis of their expertise.*)

<add> → att.edit → att.evidence → @evidence

**@extent** (*optional*) Captures a measurement, count, or description. When extent contains a numeric value, use the unit attribute to indicate the measurement unit. Value is plain text.

<add> → att.extent → @extent

**@facsimile** (*optional*) Points to one or more images, portions of an image, or surfaces which correspond to the current element. One or more values from [data.URI](#), separated by spaces.

<add> → att.facsimile → @facsimile

**@follows** (*optional*) points to one or more events in a user-defined collection that are known to be predecessors of the current element. One or more values from [data.URI](#), separated by spaces.

<add> → att.common → att.linked → @follows

**@hand** (*optional*) Signifies the hand responsible for an action. The value must be the ID of a <hand> element declared in the header. Value conforms to [data.URI](#).

<add> → att.trans → att.handIdent → @hand

**@instant** The @instant attribute is syntactic sugar for classifying a scribal intervention as an ad-hoc modification; that is, one which does not interrupt the writing process. Value must conform to **data.BOOLEAN** or **unknown**.

<add> → att.trans → att.geneticState → @instant

**@label** (*optional*) Captures text to be used to generate a label for the element to which it's attached, a "tool tip" or prefatory text, for example. Should not be used to record document content. Value is plain text.

<add> → att.common → att.labelled → @label

**@max** (*optional*) Where the measurement summarizes more than one observation or a range of values, supplies the maximum value observed. Value is a decimal number.

<add> → att.extent → att.ranging → @max

**@min** (*optional*) Where the measurement summarizes more than one observation or a range of values, supplies the minimum value observed. Value is a decimal number.

<add> → att.extent → att.ranging → @min

**@on** (*optional*) Provides a number-like designation that indicates an element's position in a sequence of similar elements. May not contain space characters. Value conforms to [data.WORD](#).

<add> → att.common → att.nNumberLike → @on

**@next** (*optional*) Used to point to the next event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<add> → att.common → att.linked → @next

**@place** Location of the addition. One or more values from [data.PLACEMENT](#), separated by spaces.

<add> → direct children → @place

**@precedes** (*optional*) Points to one or more events in a user-defined collection that are known to be successors of the current element. One or more values from [data.URI](#), separated by spaces.

<add> → att.common → att.linked → @precedes

**@prev** (*optional*) Points to the previous event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<add> → att.common → att.linked → @prev

**@resp** (*optional*) Indicates the agent(s) responsible for some aspect of the text's transcription, editing, or encoding. Its value must point to one or more identifiers declared in the document header. One or more values from [data.URI](#), separated by spaces.

<add> → att.common → att.responsibility → @resp

**@sameas** (*optional*) Points to an element that is the same as the current element but is not a literal copy of the current element. One or more values from [data.URI](#), separated by spaces.

<add> → att.common → att.linking → @sameas

**@seq** (*optional*) Used to assign a sequence number related to the order in which the encoded features carrying this attribute are believed to have occurred. Value is a positive integer.

<add> → att.trans → att.sequence → @seq

**@source** (*optional*) Contains a list of one or more pointers indicating the sources which attest to a given reading. Each value should correspond to the ID of a [<source>](#) or [<manifestation>](#) element located in the document header. One or more values from [data.URI](#), separated by spaces.

<add> → att.edit → att.source → @source

**@state** Points to the genetic state that results from this modification. One or more values from [data.URI](#), separated by spaces.

<add> → att.trans → att.geneticState → @state

**@synch** (*optional*) Points to elements that are synchronous with the current element. One or more values from [data.URI](#), separated by spaces.

<add> → att.common → att.linking → @synch

**@translit** (*optional*) Specifies the transliteration technique used. Value is a [NMTOKEN](#).

<add> → att.lang → @translit

**@type** (*optional*) Designation which characterizes the element in some sense, using any convenient classification scheme or typology that employs single-token labels. One or more values of datatype [NMTOKEN](#), separated by spaces.

<add> → att.common → att.typed → @type

**@unit** (*optional*) Indicates the unit of measurement. Allowed values are: "byte" (Byte.), "char" (Character.), "cm" (Centimeter.), "deg" (Degree.), "in" (Inch.), "issue" (Serial issue.), "ft" (Foot.), "m" (Meter.), "mm" (Millimeter.), "page" (Page.), "pc" (Pica.), "pt" (Point.), "px" (Pixel.), "rad" (Radian.), "record" (Record.), "vol" (Serial volume.), "vu" (MEI virtual unit.)

<add> → att.extent → att.measurement → @unit

**@xml:base** (*optional*) Provides a base URI reference with which applications can resolve relative URI references into absolute URI references. Value conforms to [data.URI](#).

<add> → att.common → att.basic → @xml:base

**@xml:id** (*optional*) Regularizes the naming of an element and thus facilitates building links between it and other resources. Each id attribute within a document must have a unique value. Value is a valid [xml:id](#).

<add> → att.common → att.basic → att.id → @xml:id

**@xml:lang** (*optional*) Identifies the language of the element's content. The values for this attribute are language 'tags' as defined in BCP 47. All language tags that make use of private use sub-tags must be documented in a corresponding language element in the MEI header whose id attribute is the same as the language tag's value. Value is a [language](#).

<add> → att.lang → @xml:lang

**Member of**

[model.transcriptionLike](#) Groups elements used for editorial transcription of pre-existing source materials.

**Contained By**

**<abbr>** A generic element for 1) a shortened form of a word, including an acronym or 2) a shorthand notation.

<add> → [model.transcriptionLike](#) → <abbr>

**<add>** Marks an addition to the text.

<add> → [model.transcriptionLike](#) → <add>

**<addName>** Contains an additional name component, such as a nickname, epithet, or alias, or any other descriptive phrase used within a personal name.

<add> → [model.transcriptionLike](#) → <addName>

**<addrLine>** Single line of a postal address.

<add> → [model.transcriptionLike](#) → <addrLine>

**<anchoredText>** Container for text that is fixed to a particular page location, regardless of changes made to the layout of the measures around it.

<add> → [model.transcriptionLike](#) → <anchoredText>

**<annot>** Provides a statement explaining the text or indicating the basis for an assertion.

<add> → [model.transcriptionLike](#) → <annot>

**<attacca>** An instruction to begin the next section or movement of a composition without pause.

<add> → [model.transcriptionLike](#) → <attacca>

**<beam>** A container for a series of explicitly beamed events that begins and ends entirely within a measure.

<add> → [model.transcriptionLike](#) → <beam>

**<bifolium>** Describes a folded sheet of paper.

<add> → elements having add as direct children → <bifolium>

**<bloc>** Contains the name of a geopolitical unit consisting of two or more nation states or countries.

<add> → [model.transcriptionLike](#) → <bloc>

**<caption>** A label which accompanies an illustration or a table.

<add> → [model.transcriptionLike](#) → <caption>

**<chord>** A simultaneous sounding of two or more notes in the same layer \*with the same duration\*.

<add> → [model.transcriptionLike](#) → <chord>

**<contentItem>** Contains a single entry within a content description element.

<add> → [model.transcriptionLike](#) → <contentItem>

**<corpName>** Identifies an organization or group of people that acts as a single entity.

<add> → [model.transcriptionLike](#) → <corpName>

**<corr>** Contains the correct form of an apparent erroneous passage.

<add> → [model.transcriptionLike](#) → <corr>

**<country>** Contains the name of a geopolitical unit, such as a nation, country, colony, or commonwealth, larger than or administratively superior to a region and smaller than a bloc.

<add> → [model.transcriptionLike](#) → <country>

**<cpMark>** A verbal or graphical indication to copy musical material written elsewhere.

<add> → model.transcriptionLike → <cpMark>

**<damage>** Contains an area of damage to the physical medium.

<add> → model.transcriptionLike → <damage>

**<del>** Contains information deleted, marked as deleted, or otherwise indicated as superfluous or spurious in the copy text by an author, scribe, annotator, or corrector.

<add> → model.transcriptionLike → <del>

**<desc>** Container for text that briefly describes the feature to which it is attached, including its intended usage, purpose, or application as appropriate.

<add> → model.transcriptionLike → <desc>

**<dir>** An instruction expressed as a combination of text and symbols, typically above, below, or between staves, but not on the staff — that is not encoded elsewhere in more specific elements, like <tempo>,

<dynam> or <repeatMark>.

<add> → model.transcriptionLike → <dir>

**<district>** Contains the name of any kind of subdivision of a settlement, such as a parish, ward, or other administrative or geographic unit.

<add> → model.transcriptionLike → <district>

**<dynam>** Indication of the volume of a note, phrase, or section of music.

<add> → model.transcriptionLike → <dynam>

**<ending>** Alternative ending for a repeated passage of music; i.e., prima volta, seconda volta, etc.

<add> → model.transcriptionLike → <ending>

**<epigraph>** Contains a quotation, anonymous or attributed, appearing on a title page.

<add> → model.transcriptionLike → model.paracontentPart → <epigraph>

**<expan>** Contains the expansion of an abbreviation.

<add> → model.transcriptionLike → <expan>

**<f>** Single element of a figured bass indication.

<add> → model.transcriptionLike → <f>

**<famName>** Contains a family (inherited) name, as opposed to a given, baptismal, or nick name.

<add> → model.transcriptionLike → <famName>

**<fb>** Symbols added to a bass line that indicate harmony. Used to improvise a chordal accompaniment. Sometimes called Generalbass, thoroughbass, or basso continuo.

<add> → model.transcriptionLike → <fb>

**<fing>** finger – An individual finger in a fingering indication.

<add> → model.transcriptionLike → <fing>

**<fingGrp>** (finger group)– A group of individual fingers in a fingering indication.

<add> → model.transcriptionLike → <fingGrp>

**<foliaDesc>** Describes the order of folia and bifolia making up the text block of a manuscript or print.

<add> → elements having add as direct children → <foliaDesc>

**<foreName>** Contains a forename, given or baptismal name.

<add> → model.transcriptionLike → <foreName>

**<genName>** Contains a name component used to distinguish otherwise similar names on the basis of the relative ages or generations of the persons named.

<add> → model.transcriptionLike → <genName>

**<geogFeat>** Contains a common noun identifying a geographical feature.

<add> → model.transcriptionLike → <geogFeat>

**<geogName>** The proper noun designation for a place, natural feature, or political jurisdiction.

<add> → model.transcriptionLike → <geogName>

**<graceGrp>** A container for a sequence of grace notes.

<add> → model.transcriptionLike → <graceGrp>

**<harm>** An indication of harmony, e.g., chord names, tablature grids, harmonic analysis, figured bass.

<add> → model.transcriptionLike → <harm>

**<head>** Contains any heading, for example, the title of a section of text, or the heading of a list.

<add> → model.transcriptionLike → <head>

**<identifier>** An alpha-numeric string that establishes the identity of the described material.

<add> → model.transcriptionLike → <identifier>

**<imprimatur>** Contains a formal statement authorizing the publication of a work, sometimes required to appear on a title page or its verso.

<add> → model.transcriptionLike → model.paracontentPart → <imprimatur>

**<imprint>** Information relating to the publication or distribution of a bibliographic item.

<add> → model.transcriptionLike → <imprint>

**<keySig>** Written key signature.

<add> → model.transcriptionLike → <keySig>

**<l>** Contains a single line of text within a line group.

<add> → model.transcriptionLike → <l>

**<label>** A container for document text that identifies the feature to which it is attached. For a "tool tip" or other generated label, use the label attribute.

<add> → model.transcriptionLike → <label>

**<labelAbbr>** A label on the pages following the first.

<add> → model.transcriptionLike → <labelAbbr>

**<layer>** An independent stream of events on a staff.

<add> → model.transcriptionLike → <layer>

**<lem>** (lemma) – Contains the lemma, or base text, of a textual variation.

<add> → model.transcriptionLike → <lem>

**<li>** Single item in a <list>.

<add> → model.transcriptionLike → <li>

**<ligature>** A mensural notation symbol that combines two or more notes into a single sign.

<add> → model.transcriptionLike → <ligature>

**<measure>** Unit of musical time consisting of a fixed number of note values of a given type, as determined by the prevailing meter, and delimited in musical notation by bar lines.

<add> → model.transcriptionLike → <measure>

**<metaMark>** A graphical or textual statement with additional / explanatory information about the musical text. The textual consequences of this intervention are encoded independently via other means; that is, with elements such as <add>, <del>, etc.

<add> → model.transcriptionLike → <metaMark>

**<name>** Proper noun or noun phrase.

<add> → model.transcriptionLike → <name>

**<nameLink>** Contains a connecting phrase or link used within a name but not regarded as part of it, such as "van der" or "of", "from", etc.

<add> → model.transcriptionLike → <nameLink>

**<nc>** Sign representing a single pitched event, although the exact pitch may not be known.

<add> → model.transcriptionLike → <nc>

**<ncGrp>** Collection of one or more neume components.

<add> → model.transcriptionLike → <ncGrp>

**<neume>** Sign representing one or more musical pitches.

<add> → model.transcriptionLike → <neume>

**<note>** A single pitched event.

<add> → model.transcriptionLike → <note>

**<num>** Numeric information in any form.

<add> → model.transcriptionLike → <num>

**<oLayer>** A layer that contains an alternative to material in another layer.

<add> → model.transcriptionLike → <oLayer>

**<oStaff>** A staff that holds an alternative passage which may be played instead of the original material.

<add> → model.transcriptionLike → <oStaff>

**<orig>** Contains material which is marked as following the original, rather than being normalized or corrected.

<add> → model.transcriptionLike → <orig>

**<ornam>** An element indicating an ornament that is not a mordent, turn, or trill.

<add> → model.transcriptionLike → <ornam>

**<p>** One or more text phrases that form a logical prose passage.

<add> → model.transcriptionLike → model paracontentPart → <p>

**<part>** An alternative visual rendition of the score from the point of view of a particular performer (or group of performers).

<add> → model.transcriptionLike → <part>

**<periodName>** A label that describes a period of time, such as 'Baroque' or '3rd Style period'.

<add> → model.transcriptionLike → <periodName>

**<persName>** Designation for an individual, including any or all of that individual's forenames, surnames, honorific titles, and added names.

<add> → model.transcriptionLike → <persName>

**<pgFoot>** A running footer.

<add> → model.transcriptionLike → <pgFoot>

**<pgHead>** A running header.

<add> → model.transcriptionLike → <pgHead>

**<postBox>** (postal box or post office box) contains a number or other identifier for some postal delivery point other than a street address.

<add> → model.transcriptionLike → <postBox>

**<postCode>** (postal code) contains a numerical or alphanumeric code used as part of a postal address to simplify sorting or delivery of mail.

<add> → model.transcriptionLike → <postCode>

**<quote>** Contains a paragraph-like block of text attributed to an external source, normally set off from the surrounding text by spacing or other typographic distinction.

<add> → model.transcriptionLike → model.paracontentPart → <quote>

**<rdg>** (reading) – Contains a single reading within a textual variation.

<add> → model.transcriptionLike → <rdg>

**<reg>** Contains material which has been regularized or normalized in some sense.

<add> → model.transcriptionLike → <reg>

**<region>** Contains the name of an administrative unit such as a state, province, or county, larger than a settlement, but smaller than a country.

<add> → model.transcriptionLike → <region>

**<rend>** A formatting element indicating special visual rendering, e.g., bold or italicized, of a text word or phrase.

<add> → model.transcriptionLike → <rend>

**<repeatMark>** An instruction expressed as a combination of text and symbols – segno and coda – typically above, below, or between staves, but not on the staff.

<add> → model.transcriptionLike → <repeatMark>

**<rest>** A non-sounding event found in the source being transcribed.

<add> → model.transcriptionLike → <rest>

**<restore>** Indicates restoration of material to an earlier state by cancellation of an editorial or authorial marking or instruction.

<add> → model.transcriptionLike → <restore>

**<roleName>** Contains a name component which indicates that the referent has a particular role or position in society, such as an official title or rank.

<add> → model.transcriptionLike → <roleName>

**<score>** Full score view of the musical content.

<add> → model.transcriptionLike → <score>

**<section>** Segment of music data.

<add> → model.transcriptionLike → <section>

**<seg>** (arbitrary segment) represents any segmentation of text below the "text component" level.

<add> → model.transcriptionLike → <seg>

**<settlement>** Contains the name of a settlement such as a city, town, or village identified as a single geopolitical or administrative unit.

<add> → model.transcriptionLike → <settlement>

**<sic>** Contains apparently incorrect or inaccurate material.

<add> → model.transcriptionLike → <sic>

**<signifLet>** Significantive letter(s).

<add> → model.transcriptionLike → <signifLet>

**<speaker>** Contains a specialized form of heading or label, giving the name of one or more speakers in a dramatic text or fragment.

<add> → model.transcriptionLike → <speaker>

**<staff>** A group of equidistant horizontal lines on which notes are placed in order to represent pitch or a grouping element for individual 'strands' of notes, rests, etc. that may or may not actually be rendered on staff lines; that is, both diastematic and non-diastematic signs.

<add> → model.transcriptionLike → <staff>

**<stageDir>** Contains any kind of stage direction within a dramatic text or fragment.

<add> → model.transcriptionLike → <stageDir>

**<street>** full street address including any name or number identifying a building as well as the name of the street or route on which it is located.

<add> → model.transcriptionLike → <street>

**<styleName>** A label for a characteristic style of writing or performance, such as 'bebop' or 'rock-n-roll'.

<add> → model.transcriptionLike → <styleName>

**<subst>** Groups transcriptional elements when the combination is to be regarded as a single intervention in the text.

<add> → model.transcriptionLike → <subst>

**<supplied>** Contains material supplied by the transcriber or editor for any reason.

<add> → model.transcriptionLike → <supplied>

**<syl>** Individual lyric syllable.

<add> → model.transcriptionLike → <syl>

**<syllable>** Neume notation can be thought of as "neumed text". Therefore, the syllable element provides high-level organization in this repertoire.

<add> → model.transcriptionLike → <syllable>

**<td>** Designates a table cell that contains data as opposed to a cell that contains column or row heading information.

<add> → model.transcriptionLike → <td>

**<tempo>** Text and symbols descriptive of tempo, mood, or style, e.g., "allarg.", "a tempo", "cantabile", "Moderato", "J=60", "Moderato J =60").

<add> → model.transcriptionLike → <tempo>

**<th>** Designates a table cell containing column or row heading information as opposed to one containing data.

<add> → model.transcriptionLike → <th>

**<title>** Title of a bibliographic entity.

<add> → model.transcriptionLike → <title>

**<titlePage>** Contains a transcription of the title page of a text.

<add> → model.transcriptionLike → <titlePage>

**<titlePart>** Contains a subsection or division of the title of a bibliographic entity.

<add> → model.transcriptionLike → <titlePart>

**<tuplet>** A group of notes with "irregular" (sometimes called "irrational") rhythmic values, for example, three notes in the time normally occupied by two or nine in the time of five.

<add> → model.transcriptionLike → <tuplet>

**<unclear>** Contains material that cannot be transcribed with certainty because it is illegible or inaudible in the source.

<add> → [model.transcriptionLike](#) → <unclear>

## May Contain

**<abbr>** A generic element for 1) a shortened form of a word, including an acronym or 2) a shorthand notation.

<add> → [model.editTransPart](#) → [model.editTransPart.text](#) → [model.textPhraseLike.limited](#) → [model.editorialLike](#) → <abbr>

**<accid>** Records a temporary alteration to the pitch of a note.

<add> → [model.layerPart](#) → [model.layerPart.mensuralAndNeumes](#) → [model.noteModifierLike](#) → <accid>

**<add>** Marks an addition to the text.

<add> → [model.transcriptionLike](#) → <add>

**<address>** Contains a postal address, for example of a publisher, an organization, or an individual.

<add> → [model.editTransPart](#) → [model.editTransPart.text](#) → [model.textPhraseLike.limited](#) → [model.addressLike](#) → <address>

**<anchoredText>** Container for text that is fixed to a particular page location, regardless of changes made to the layout of the measures around it.

<add> → [model.graphicPrimitiveLike](#) → <anchoredText>

**<annot>** Provides a statement explaining the text or indicating the basis for an assertion.

<add> → [model.editTransPart](#) → [model.editTransPart.text](#) → [model.textPhraseLike.limited](#) → [model.annotLike](#) → <annot>

**<arpeg>** Indicates that the notes of a chord are to be performed successively rather than simultaneously, usually from lowest to highest. Sometimes called a "roll".

<add> → [model.editTransPart](#) → [model.editTransPart.music](#) → [model.controlEventLike.cmn](#) → <arpeg>

**<artic>** An indication of how to play a note or chord.

<add> → [model.layerPart](#) → [model.layerPart.mensuralAndNeumes](#) → [model.noteModifierLike](#) → <artic>

**<attacca>** An instruction to begin the next section or movement of a composition without pause.

<add> → [model.editTransPart](#) → [model.editTransPart.music](#) → [model.controlEventLike.cmn](#) → <attacca>

**<bTrem>** A rapid alternation on a single pitch or chord.

<add> → [model.layerPart](#) → [model.layerPart.cmn](#) → [model.eventLike.cmn](#) → <bTrem>

**<barLine>** Vertical line drawn through one or more staves that divides musical notation into metrical units.

<add> → [model.layerPart](#) → [model.eventLike](#) → <barLine>

**<beam>** A container for a series of explicitly beamed events that begins and ends entirely within a measure.

<add> → [model.layerPart](#) → [model.layerPart.cmn](#) → [model.eventLike.cmn](#) → <beam>

**<beamSpan>** Alternative element for explicitly encoding beams, particularly those which extend across bar lines.

<add> → [model.editTransPart](#) → [model.editTransPart.music](#) → [model.controlEventLike.cmn](#) → <beamSpan>

**<beatRpt>** An indication that material on a preceding beat should be repeated.

<add> → [model.layerPart](#) → [model.layerPart.cmn](#) → [model.eventLike.cmn](#) → <beatRpt>

**<bend>** A variation in pitch (often micro-tonal) upwards or downwards during the course of a note.

<add> → [model.editTransPart](#) → [model.editTransPart.music](#) → [model.controlEventLike](#) → <bend>

**<bibl>** Provides a loosely-structured bibliographic citation in which the sub-components may or may not be explicitly marked.

<add> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.biblLike → <bibl>

**<biblList>** List of bibliographic references.

<add> → model.editTransPart → model.editTransPart.text → model.textComponentLike → model.listLike → <biblList>

**<biblStruct>** Contains a bibliographic citation in which bibliographic sub-elements must appear in a specified order.

<add> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.biblLike → <biblStruct>

**<bloc>** Contains the name of a geopolitical unit consisting of two or more nation states or countries.

<add> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <bloc>

**<bracketSpan>** Marks a sequence of notational events grouped by a bracket.

<add> → model.editTransPart → model.editTransPart.music → model.controlEventLike.cmn → <bracketSpan>

**<breath>** An indication of a point at which the performer on an instrument requiring breath (including the voice) may breathe.

<add> → model.editTransPart → model.editTransPart.music → model.controlEventLike.cmn → <breath>

**<caesura>** Break, pause, or interruption in the normal tempo of a composition. Typically indicated by "railroad tracks", i.e., two diagonal slashes.

<add> → model.editTransPart → model.editTransPart.music → model.controlEventLike → <caesura>

**<castList>** Contains a single cast list or dramatis personae.

<add> → model.editTransPart → model.editTransPart.text → model.textComponentLike → model.listLike → <castList>

**<catchwords>** Describes the system used to ensure correct ordering of the quires making up an item, typically by means of annotations at the foot of the page.

<add> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.msInLine → <catchwords>

**<cb>** An empty formatting element that forces text to begin in a new column.

<add> → model.milestoneLike.music → <cb>

**<choice>** Groups a number of alternative encodings for the same point in a text.

<add> → model.editLike → <choice>

**<chord>** A simultaneous sounding of two or more notes in the same layer \*with the same duration\*.

<add> → model.layerPart → model.eventLike → <chord>

**<clef>** Indication of the exact location of a particular note on the staff and, therefore, the other notes as well.

<add> → model.layerPart → model.eventLike → <clef>

**<clefGrp>** A set of simultaneously-occurring clefs.

<add> → model.layerPart → model.eventLike → <clefGrp>

**<colLayout>** An empty formatting element that signals the start of columnar layout.

<add> → model.milestoneLike.music → <colLayout>

**<corpName>** Identifies an organization or group of people that acts as a single entity.

<add> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.nameLike → model.nameLike.agent → <corpName>

**<corr>** Contains the correct form of an apparent erroneous passage.

<add> → model.transcriptionLike → <corr>

**<country>** Contains the name of a geopolitical unit, such as a nation, country, colony, or commonwealth, larger than or administratively superior to a region and smaller than a bloc.

<add> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <country>

**<cpMark>** A verbal or graphical indication to copy musical material written elsewhere.

<add> → model.editTransPart → model.editTransPart.music → model.controlEventLike → <cpMark>

**<curve>** A curved line that cannot be represented by a more specific element, such as a slur.

<add> → model.graphicPrimitiveLike → <curve>

**<custos>** Symbol placed at the end of a line of music to indicate the first note of the next line. Sometimes called a "direct".

<add> → model.layerPart → model.eventLike → <custos>

**<damage>** Contains an area of damage to the physical medium.

<add> → model.transcriptionLike → <damage>

**<date>** A string identifying a point in time or the time period between two such points.

<add> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.dateLike → <date>

**<dedicatee>** Entity to whom a creative work is formally offered.

<add> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → <dedicatee>

**<del>** Contains information deleted, marked as deleted, or otherwise indicated as superfluous or spurious in the copy text by an author, scribe, annotator, or corrector.

<add> → model.transcriptionLike → <del>

**<depth>** Description of a measurement taken through a three-dimensional object.

<add> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.dimLike → <depth>

**<dim>** Any single dimensional specification.

<add> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.dimLike → <dim>

**<dimensions>** Information about the physical size of an entity; usually includes numerical data.

<add> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → <dimensions>

**<dir>** An instruction expressed as a combination of text and symbols, typically above, below, or between staves, but not on the staff — that is not encoded elsewhere in more specific elements, like <tempo>, <dynam> or <repeatMark>.

<add> → model.editTransPart → model.editTransPart.music → model.controlEventLike → <dir>

**<district>** Contains the name of any kind of subdivision of a settlement, such as a parish, ward, or other administrative or geographic unit.

<add> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <district>

**<div>** Major structural division of text, such as a preface, chapter or section.

<add> → model.divLike → <div>

**<divLine>** Represents a division (divisio) in neume notation. Divisions indicate short, medium, or long pauses similar to breath marks in modern notation.

<add> → model.layerPart → model.layerPart.mensuralAndNeumes → model.layerPart.neumes → model.eventLike.neumes → <divLine>

**<dot>** Dot of augmentation or division.

<add> → model.layerPart → model.layerPart.mensuralAndNeumes → model.layerPart.mensural → model.eventLike.mensural → <dot>

**<dot>** Dot of augmentation or division.

<add> → model.layerPart → model.layerPart.mensuralAndNeumes → model.noteModifierLike → <dot>

**<dynam>** Indication of the volume of a note, phrase, or section of music.

<add> → model.editTransPart → model.editTransPart.music → model.controlEventLike → <dynam>

**<ending>** Alternative ending for a repeated passage of music; i.e., prima volta, seconda volta, etc.

<add> → model.sectionPart → model.endingLike → <ending>

**<eventList>** Contains historical information given as a sequence of significant past events.

<add> → model.editTransPart → model.editTransPart.text → model.textComponentLike → model.listLike → <eventList>

**<expan>** Contains the expansion of an abbreviation.

<add> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.editorialLike → <expan>

**<extent>** Used to express size in terms other than physical dimensions, such as number of pages, records, bytes, physical components, etc.

<add> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → <extent>

**<f>** Single element of a figured bass indication.

<add> → model.fLike → <f>

**<fTrem>** A rapid alternation between a pair of notes (or chords or perhaps between a note and a chord) that are (usually) farther apart than a major second.

<add> → model.layerPart → model.layerPart.cmn → model.eventLike.cmn → <fTrem>

**<fermata>** An indication placed over a note or rest to indicate that it should be held longer than its written value. May also occur over a bar line to indicate the end of a phrase or section. Sometimes called a 'hold' or 'pause'.

<add> → model.editTransPart → model.editTransPart.music → model.controlEventLike.cmn → <fermata>

**<fig>** Groups elements representing or containing graphic information such as an illustration or figure.

<add> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.figureLike → <fig>

**<fing>** finger – An individual finger in a fingering indication.

<add> → model.editTransPart → model.editTransPart.music → model.controlEventLike → model.fingeringLike → <fing>

**<fingGrp>** (finger group)– A group of individual fingers in a fingering indication.

<add> → model.editTransPart → model.editTransPart.music → model.controlEventLike → model.fingeringLike → <fingGrp>

**<gap>** Indicates a point where material has been omitted in a transcription, whether as part of sampling practice or for editorial reasons described in the MEI header.

<add> → model.transcriptionLike → <gap>

**<geogFeat>** Contains a common noun identifying a geographical feature.

<add> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <geogFeat>

**<geogName>** The proper noun designation for a place, natural feature, or political jurisdiction.

<add> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.nameLike → model.nameLike.place → model.nameLike.ge

**<gliss>** A continuous or sliding movement from one pitch to another, usually indicated by a straight or wavy line.

<add> → model.editTransPart → model.editTransPart.music → model.controlEventLike → <gliss>

**<graceGrp>** A container for a sequence of grace notes.

<add> → model.layerPart → model.layerPart.cmn → model.eventLike.cmn → <graceGrp>

**<hairpin>** Indicates continuous dynamics expressed on the score as wedge-shaped graphics, e.g., < and >.

<add> → model.editTransPart → model.editTransPart.music → model.controlEventLike.cmn → <hairpin>

**<halfmRpt>** A half-measure repeat in any meter.

<add> → model.layerPart → model.layerPart.cmn → model.eventLike.cmn → <halfmRpt>

**<handShift>** Marks the beginning of a passage written in a new hand, or of a change in the scribe, writing style, ink or character of the document hand.

<add> → model.transcriptionLike → <handShift>

**<harm>** An indication of harmony, e.g., chord names, tablature grids, harmonic analysis, figured bass.

<add> → model.editTransPart → model.editTransPart.music → model.controlEventLike → model.controlEventLike.harmony → model.harmLike → <harm>

**<harpPedal>** Harp pedal diagram.

<add> → model.editTransPart → model.editTransPart.music → model.controlEventLike.cmn → <harpPedal>

**<height>** Description of the vertical size of an object.

<add> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.dimLike → <height>

**<heraldry>** Contains a heraldic formula or phrase, typically found as part of a blazon, coat of arms, etc.

<add> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.msInline → <heraldry>

**<identifier>** An alpha-numeric string that establishes the identity of the described material.

<add> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.identifierLike → <identifier>

**<keyAccid>** Accidental in a key signature.

<add> → model.keyAccidLike → <keyAccid>

**<keySig>** Written key signature.

<add> → model.layerPart → model.eventLike → model.keySigLike → <keySig>

**<layer>** An independent stream of events on a staff.

<add> → model.editTransPart → model.editTransPart.music → model.layerLike → <layer>

**<lb>** An empty formatting element that forces text to begin on a new line.

<add> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.lbLike → <lb>

**<lg>** May be used for any section of text that is organized as a group of lines; however, it is most often used for a group of verse lines functioning as a formal unit, e.g., a stanza, refrain, verse paragraph, etc.

<add> → model.editTransPart → model.editTransPart.text → model.textComponentLike → model.lgLike → <lg>

**<ligature>** A mensural notation symbol that combines two or more notes into a single sign.

<add> → model.layerPart → model.layerPart.mensuralAndNeumes → model.layerPart.mensural → model.eventLike.mensural → <ligature>

**<line>** A visual line that cannot be represented by a more specific; i.e., semantic, element.

<add> → model.graphicPrimitiveLike → <line>

**<list>** A formatting element that contains a series of items separated from one another and arranged in a linear, often vertical, sequence.

<add> → model.editTransPart → model.editTransPart.text → model.textComponentLike → model.listLike → <list>

**<locus>** Defines a location within a manuscript or manuscript component, usually as a (possibly discontinuous) sequence of folio references.

<add> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.msInline → <locus>

**<locusGrp>** Groups locations which together form a distinct but discontinuous item within a manuscript or manuscript part, according to a specific foliation.

<add> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.msInline → <locusGrp>

**<lv>** A "tie-like" indication that a note should ring beyond its written duration.

<add> → model.editTransPart → model.editTransPart.music → model.controlEventLike.cmn → <lv>

**<mRest>** Complete measure rest in any meter.

<add> → model.layerPart → model.layerPart.cmn → model.eventLike.measureFilling → <mRest>

**<mRpt>** An indication that the previous measure should be repeated.

<add> → model.layerPart → model.layerPart.cmn → model.eventLike.measureFilling → <mRpt>

**<mRpt2>** An indication that the previous two measures should be repeated.

<add> → model.layerPart → model.layerPart.cmn → model.eventLike.measureFilling → <mRpt2>

**<mSpace>** A measure containing only empty space in any meter.

<add> → model.layerPart → model.layerPart.cmn → model.eventLike.measureFilling → <mSpace>

**<measure>** Unit of musical time consisting of a fixed number of note values of a given type, as determined by the prevailing meter, and delimited in musical notation by bar lines.

<add> → model.sectionPart → model.sectionPart.cmn → model.measureLike → <measure>

**<mensur>** Collects information about the metrical relationship between a note value and the next smaller value; that is, either triple or duple.

<add> → model.layerPart → model.layerPart.mensuralAndNeumes → model.layerPart.mensural → model.eventLike.mensural → <mensur>

**<metaMark>** A graphical or textual statement with additional / explanatory information about the musical text. The textual consequences of this intervention are encoded independently via other means; that is, with elements such as <add>, <del>, etc.

<add> → model.editTransPart → model.editTransPart.music → model.controlEventLike → <metaMark>

**<meterSig>** Written meter signature.

<add> → model.layerPart → model.eventLike → model.meterSigLike → <meterSig>

**<meterSigGrp>** Used to capture alternating, interchanging, mixed or other non-standard meter signatures.

<add> → model.layerPart → model.eventLike → model.meterSigLike → <meterSigGrp>

**<midi>** Container for elements that contain information useful when generating MIDI output.

<add> → model.layerPart → model.layerPart.mensuralAndNeumes → model.midiLike → <midi>

**<mordent>** An ornament indicating rapid alternation of the main note with a secondary note, usually a step below, but sometimes a step above.

<add> → model.editTransPart → model.editTransPart.music → model.controlEventLike.cmn → model.ornamentLike.cmn → <mordent>

**<multiRest>** Multiple measures of rest compressed into a single symbol, frequently found in performer parts.

<add> → model.layerPart → model.layerPart.cmn → model.eventLike.measureFilling → <multiRest>

**<multiRpt>** Multiple repeated measures.

<add> → model.layerPart → model.layerPart.cmn → model.eventLike.measureFilling → <multiRpt>

**<name>** Proper noun or noun phrase.

<add> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.nameLike → <name>

**<neume>** Sign representing one or more musical pitches.

<add> → model.layerPart → model.layerPart.mensuralAndNeumes → model.layerPart.neumes → model.eventLike.neumes → <neume>

**<note>** A single pitched event.

<add> → model.layerPart → model.eventLike → <note>

**<num>** Numeric information in any form.

<add> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.measurementLike → model.numLike → <num>

**<octave>** An indication that a passage should be performed one or more octaves above or below its written pitch.

<add> → model.editTransPart → model.editTransPart.music → model.controlEventLike.cmn → <octave>

**<orig>** Contains material which is marked as following the original, rather than being normalized or corrected.

<add> → model.transcriptionLike → <orig>

**<ornam>** An element indicating an ornament that is not a mordent, turn, or trill.

<add> → model.editTransPart → model.editTransPart.music → model.controlEventLike → <ornam>

**<p>** One or more text phrases that form a logical prose passage.

<add> → model.editTransPart → model.editTransPart.text → model.textComponentLike → model.pLike → <p>

**<pad>** An indication of extra visual space between notational elements.

<add> → model.layerPart → model.eventLike → <pad>

**<pb>** An empty formatting element that forces text to begin on a new page.

<add> → model.milestoneLike.music → model.pbLike → <pb>

**<pedal>** Piano pedal mark.

<add> → model.editTransPart → model.editTransPart.music → model.controlEventLike.cmn → <pedal>

**<periodName>** A label that describes a period of time, such as 'Baroque' or '3rd Style period'.

<add> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.nameLike.label → <periodName>

**<persName>** Designation for an individual, including any or all of that individual's forenames, surnames, honorific titles, and added names.

<add> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.nameLike → model.nameLike.agent → <persName>

**<phrase>** Indication of 1) a "unified melodic idea" or 2) performance technique.

<add> → model.editTransPart → model.editTransPart.music → model.controlEventLike → <phrase>

**<postBox>** (postal box or post office box) contains a number or other identifier for some postal delivery point other than a street address.

<add> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.addressPart → <postBox>

**<postCode>** (postal code) contains a numerical or alphanumeric code used as part of a postal address to simplify sorting or delivery of mail.

<add> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.addressPart → <postCode>

**<proport>** Description of note duration as arithmetic ratio.

<add> → model.layerPart → model.layerPart.mensuralAndNeumes → model.layerPart.mensural → model.eventLike.mensural → <proport>

**<ptr>** Defines a traversible pointer to another location, using only attributes to describe the destination.

<add> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.locrefLike → <ptr>

**<q>** Contains material which is distinguished from the surrounding phrase-level text using quotation marks or a similar method. Use **<quote>** for block-level quotations.

<add> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.qLike → <q>

**<quote>** Contains a paragraph-like block of text attributed to an external source, normally set off from the surrounding text by spacing or other typographic distinction.

<add> → model.editTransPart → model.editTransPart.text → model.textComponentLike → model.quoteLike → <quote>

**<ref>** Defines a traversible reference to another location. May contain text and sub-elements that describe the destination.

<add> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.locrefLike → <ref>

**<refrain>** Recurring lyrics, especially at the end of each verse or stanza of a poem or song lyrics; a chorus.

<add> → model.editTransPart → model.editTransPart.music → model.verseLike → <refrain>

**<reg>** Contains material which has been regularized or normalized in some sense.

<add> → model.transcriptionLike → <reg>

**<region>** Contains the name of an administrative unit such as a state, province, or county, larger than a settlement, but smaller than a country.

<add> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <region>

**<reh>** In an orchestral score and its corresponding parts, a mark indicating a convenient point from which to resume rehearsal after a break.

<add> → model.editTransPart → model.editTransPart.music → model.controlEventLike.cmn → <reh>

**<relation>** Describes a relationship or linkage amongst entities.

<add> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.relationLike → <relation>

**<relationList>** Gathers relation elements.

<add> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.relationLike → <relationList>

**<rend>** A formatting element indicating special visual rendering, e.g., bold or italicized, of a text word or phrase.

<add> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.rendLike → <rend>

**<repeatMark>** An instruction expressed as a combination of text and symbols – segno and coda – typically above, below, or between staves, but not on the staff.

<add> → model.editTransPart → model.editTransPart.music → model.controlEventLike → <repeatMark>

**<repository>** Institution, agency, or individual which holds a bibliographic item.

<add> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.nameLike → model.nameLike.place → model.repositoryLike

**<rest>** A non-sounding event found in the source being transcribed.

<add> → model.layerPart → model.eventLike → <rest>

**<restore>** Indicates restoration of material to an earlier state by cancellation of an editorial or authorial marking or instruction.

<add> → model.transcriptionLike → <restore>

**<sb>** An empty formatting element that forces musical notation to begin on a new line.

<add> → model.milestoneLike.music → <sb>

**<scoreDef>** Container for score meta-information.

<add> → model.sectionPart → model.scoreDefLike → <scoreDef>

**<secFolio>** Marks the word or words taken from a fixed point in a codex (typically the beginning of the second leaf) in order to provide a unique identifier for the item.

<add> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.mslinline → <secFolio>

**<section>** Segment of music data.

<add> → model.sectionPart → model.sectionLike → <section>

**<seg>** (arbitrary segment) represents any segmentation of text below the "text component" level.

<add> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → <seg>

**<settlement>** Contains the name of a settlement such as a city, town, or village identified as a single geopolitical or administrative unit.

<add> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <settlement>

**<sic>** Contains apparently incorrect or inaccurate material.

<add> → model.transcriptionLike → <sic>

**<signatures>** Provides a description of the leaf or quire signatures found within a codex.

<add> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.msInline → <signatures>

**<slur>** Indication of 1) a "unified melodic idea" or 2) performance technique.

<add> → model.editTransPart → model.editTransPart.music → model.controlEventLike.cmn → <slur>

**<sp>** Contains an individual speech in a performance text.

<add> → model.editTransPart → model.editTransPart.music → model.controlEventLike → <sp>

**<space>** A placeholder used to fill an incomplete measure, layer, etc. most often so that the combined duration of the events equals the number of beats in the measure.

<add> → model.layerPart → model.eventLike → <space>

**<stack>** An inline table with a single column.

<add> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.renderLike → <stack>

**<staff>** A group of equidistant horizontal lines on which notes are placed in order to represent pitch or a grouping element for individual 'strands' of notes, rests, etc. that may or may not actually be rendered on staff lines; that is, both diastematic and non-diastematic signs.

<add> → model.sectionPart → model.sectionPart.mensuralAndNeumes → model.staffLike → <staff>

**<staffDef>** Container for staff meta-information.

<add> → model.sectionPart → model.staffDefLike → <staffDef>

**<staffGrp>** A group of bracketed or braced staves.

<add> → model.staffGrpLike → <staffGrp>

**<stageDir>** Contains any kind of stage direction within a dramatic text or fragment.

<add> → model.editTransPart → model.editTransPart.music → model.controlEventLike → model.stageDirLike → <stageDir>

**<stamp>** Contains a word or phrase describing an official mark indicating ownership, genuineness, validity, etc.

<add> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.msInline → <stamp>

**<street>** full street address including any name or number identifying a building as well as the name of the street or route on which it is located.

<add> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.addressPart → <street>

**<styleName>** A label for a characteristic style of writing or performance, such as 'bebop' or 'rock-n-roll'.

<add> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.nameLike.label → <styleName>

**<subst>** Groups transcriptional elements when the combination is to be regarded as a single intervention in the text.

<add> → model.editLike → <subst>

**<supplied>** Contains material supplied by the transcriber or editor for any reason.

<add> → model.transcriptionLike → <supplied>

**<syl>** Individual lyric syllable.

<add> → model.editTransPart → model.sylLike → <syl>

**<syllable>** Neume notation can be thought of as "neumed text". Therefore, the syllable element provides high-level organization in this repertoire.

<add> → model.layerPart → model.layerPart.mensuralAndNeumes → model.layerPart.neumes → model.syllableLike → <syllable>

**<symbol>** A reference to a previously defined symbol.

<add> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → <symbol>

**<table>** Contains text displayed in tabular form.

<add> → model.editTransPart → model.editTransPart.text → model.textComponentLike → model.tableLike → <table>

**<tempo>** Text and symbols descriptive of tempo, mood, or style, e.g., "allarg.", "a tempo", "cantabile", "Moderato", "J=60", "Moderato J =60").

<add> → model.editTransPart → model.editTransPart.music → model.controlEventLike → <tempo>

**<term>** Keyword or phrase which describes a resource.

<add> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → <term>

**<tie>** An indication that two notes of the same pitch form a single note with their combined rhythmic values.

<add> → model.editTransPart → model.editTransPart.music → model.controlEventLike.cmn → <tie>

**<title>** Title of a bibliographic entity.

<add> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.titleLike → <title>

**<trill>** Rapid alternation of a note with another (usually at the interval of a second above).

<add> → model.editTransPart → model.editTransPart.music → model.controlEventLike.cmn → model.ornamentLike.cmn → <trill>

**<tuplet>** A group of notes with "irregular" (sometimes called "irrational") rhythmic values, for example, three notes in the time normally occupied by two or nine in the time of five.

<add> → model.layerPart → model.layerPart.cmn → model.eventLike.cmn → <tuplet>

**<tupletSpan>** Alternative element for encoding tuplets, especially useful for tuplets that extend across bar lines.

<add> → model.editTransPart → model.editTransPart.music → model.controlEventLike.cmn → <tupletSpan>

**<turn>** An ornament consisting of four notes — the upper neighbor of the written note, the written note, the lower neighbor, and the written note.

<add> → model.editTransPart → model.editTransPart.music → model.controlEventLike.cmn → model.ornamentLike.cmn → <turn>

**<unclear>** Contains material that cannot be transcribed with certainty because it is illegible or inaudible in the source.

<add> → model.transcriptionLike → <unclear>

**<verse>** Division of a poem or song lyrics, sometimes having a fixed length, meter or rhyme scheme; a stanza.

<add> → model.editTransPart → model.editTransPart.music → model.verseLike → <verse>

**<volta>** Sung text for a specific iteration of a repeated section of music.

<add> → model.editTransPart → model.editTransPart.music → <volta>

**<watermark>** Contains a description of a watermark or similar device.

<add> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.msInline → <watermark>

**<width>** Description of the horizontal size of an object.

<add> → model.editTransPart → model.editTransPart.text → model.textPhraseLike.limited → model.dimLike → <width>

## Remarks

The <add> element contains material inserted by an author, scribe, annotator, or corrector. The agent responsible for the addition may be encoded using the hand attribute, while the resp attribute records the editor or transcriber responsible for identifying the hand of the addition. The cert attribute signifies the

degree of certainty ascribed to the identification of the hand of the addition. The editor(s) responsible for asserting this particular reading may be recorded in the resp attribute. The value of resp must point to one or more identifiers declared in the document header.

In no case should `<add>` contain elements that would not otherwise be permitted to occur within the parent of its own `<app>` ancestor. For example, when used as a descendent of `<verse>`, `<add>` should only contain those elements allowed within `<verse>`.

The model of this element is based on the `add` element of the Text Encoding Initiative (TEI).

## <addDesc>

(addition description) – Provides a description of significant additions found within an item, such as marginalia or other annotations.

### Module

[MEI.msDesc](#)

### Attributes

**@analog** (*optional*) Contains a reference to a field or element in another descriptive encoding system to which this MEI element is comparable. Value is plain text.

<addDesc> → [att.bibl](#) → @analog

**@class** (*optional*) Contains one or more URIs which denote classification terms that apply to the entity bearing this attribute. One or more values from [data.URI](#), separated by spaces.

<addDesc> → [att.common](#) → [att.typed](#) → [att.classed](#) → @class

**@copyof** (*optional*) Points to an element of which the current element is a copy. Value conforms to [data.URI](#).

<addDesc> → [att.common](#) → [att.linkin](#) → @copyof

**@corresp** (*optional*) Used to point to other elements that correspond to this one in a generic fashion. One or more values from [data.URI](#), separated by spaces.

<addDesc> → [att.common](#) → [att.linkin](#) → @corresp

**@follows** (*optional*) points to one or more events in a user-defined collection that are known to be predecessors of the current element. One or more values from [data.URI](#), separated by spaces.

<addDesc> → [att.common](#) → [att.linkin](#) → @follows

**@label** (*optional*) Captures text to be used to generate a label for the element to which it's attached, a "tool tip" or prefatory text, for example. Should not be used to record document content. Value is plain text.

<addDesc> → [att.common](#) → [att.labelled](#) → @label

**@n** (*optional*) Provides a number-like designation that indicates an element's position in a sequence of similar elements. May not contain space characters. Value conforms to [data.WORD](#).

<addDesc> → [att.common](#) → [att.nNumberLike](#) → @n

**@next** (*optional*) Used to point to the next event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<addDesc> → [att.common](#) → [att.linkin](#) → @next

**@precedes** (*optional*) Points to one or more events in a user-defined collection that are known to be successors of the current element. One or more values from [data.URI](#), separated by spaces.

<addDesc> → [att.common](#) → [att.linkin](#) → @precedes

**@prev** (*optional*) Points to the previous event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<addDesc> → [att.common](#) → [att.linkin](#) → @prev

**@resp** (*optional*) Indicates the agent(s) responsible for some aspect of the text's transcription, editing, or encoding. Its value must point to one or more identifiers declared in the document header. One or more values from [data.URI](#), separated by spaces.

<addDesc> → att.common → att.responsibility → @resp

**@sameas** (*optional*) Points to an element that is the same as the current element but is not a literal copy of the current element. One or more values from [data.URI](#), separated by spaces.

<addDesc> → att.common → att.linking → @sameas

**@synch** (*optional*) Points to elements that are synchronous with the current element. One or more values from [data.URI](#), separated by spaces.

<addDesc> → att.common → att.linking → @synch

**@translit** (*optional*) Specifies the transliteration technique used. Value is a [NMTOKEN](#).

<addDesc> → att.lang → @translit

**@type** (*optional*) Designation which characterizes the element in some sense, using any convenient classification scheme or typology that employs single-token labels. One or more values of datatype [NMTOKEN](#), separated by spaces.

<addDesc> → att.common → att.typed → @type

**@xml:base** (*optional*) Provides a base URI reference with which applications can resolve relative URI references into absolute URI references. Value conforms to [data.URI](#).

<addDesc> → att.common → att.basic → @xml:base

**@xml:id** (*optional*) Regularizes the naming of an element and thus facilitates building links between it and other resources. Each id attribute within a document must have a unique value. Value is a valid [xml:id](#).

<addDesc> → att.common → att.basic → att.id → @xml:id

**@xml:lang** (*optional*) Identifies the language of the element's content. The values for this attribute are language 'tags' as defined in BCP 47. All language tags that make use of private use sub-tags must be documented in a corresponding language element in the MEI header whose id attribute is the same as the language tag's value. Value is a [language](#).

<addDesc> → att.lang → @xml:lang

## Member of

[model.physDescPart](#) Groups elements that may appear as part of the physical description of a bibliographic item.

## Contained By

**<physDesc>** Container for information about the appearance, construction, or handling of physical materials, such as their dimension, quantity, color, style, and technique of creation.

<addDesc> → [model.physDescPart](#) → <physDesc>

## May Contain

**<abbr>** A generic element for 1) a shortened form of a word, including an acronym or 2) a shorthand notation.

<addDesc> → [macro.struc-unstrucContent](#) → [model.textPhraseLike.limited](#) → [model.editorialLike](#) → <abbr>

**<address>** Contains a postal address, for example of a publisher, an organization, or an individual.

<addDesc> → [macro.struc-unstrucContent](#) → [model.textPhraseLike.limited](#) → [model.addressLike](#) → <address>

**<annot>** Provides a statement explaining the text or indicating the basis for an assertion.

<addDesc> → [macro.struc-unstrucContent](#) → [model.textPhraseLike.limited](#) → [model.annotLike](#) → <annot>

**<bibl>** Provides a loosely-structured bibliographic citation in which the sub-components may or may not be explicitly marked.

<addDesc> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.biblLike → <bibl>

**<biblStruct>** Contains a bibliographic citation in which bibliographic sub-elements must appear in a specified order.

<addDesc> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.biblLike → <biblStruct>

**<bloc>** Contains the name of a geopolitical unit consisting of two or more nation states or countries.

<addDesc> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <bloc>

**<catchwords>** Describes the system used to ensure correct ordering of the quires making up an item, typically by means of annotations at the foot of the page.

<addDesc> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.mslInline → <catchwords>

**<corpName>** Identifies an organization or group of people that acts as a single entity.

<addDesc> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.nameLike → model.nameLike.agent → <corpName>

**<country>** Contains the name of a geopolitical unit, such as a nation, country, colony, or commonwealth, larger than or administratively superior to a region and smaller than a bloc.

<addDesc> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <country>

**<date>** A string identifying a point in time or the time period between two such points.

<addDesc> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.dateLike → <date>

**<dedicatee>** Entity to whom a creative work is formally offered.

<addDesc> → macro.struc-unstrucContent → model.textPhraseLike.limited → <dedicatee>

**<depth>** Description of a measurement taken through a three-dimensional object.

<addDesc> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.dimLike → <depth>

**<dim>** Any single dimensional specification.

<addDesc> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.dimLike → <dim>

**<dimensions>** Information about the physical size of an entity; usually includes numerical data.

<addDesc> → macro.struc-unstrucContent → model.textPhraseLike.limited → <dimensions>

**<district>** Contains the name of any kind of subdivision of a settlement, such as a parish, ward, or other administrative or geographic unit.

<addDesc> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <district>

**<expan>** Contains the expansion of an abbreviation.

<addDesc> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.editorialLike → <expan>

**<extent>** Used to express size in terms other than physical dimensions, such as number of pages, records, bytes, physical components, etc.

<addDesc> → macro.struc-unstrucContent → model.textPhraseLike.limited → <extent>

**<fig>** Groups elements representing or containing graphic information such as an illustration or figure.

<addDesc> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.figureLike → <fig>

**<geogFeat>** Contains a common noun identifying a geographical feature.

<addDesc> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <geogFeat>

**<geogName>** The proper noun designation for a place, natural feature, or political jurisdiction.

<addDesc> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.nameLike → model.nameLike.place → model.nameLike.geogName → <geogName>

**<head>** Contains any heading, for example, the title of a section of text, or the heading of a list.

<addDesc> → macro.struc-unstrucContent → model.headLike → <head>

**<height>** Description of the vertical size of an object.

<addDesc> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.dimLike → <height>

**<heraldry>** Contains a heraldic formula or phrase, typically found as part of a blazon, coat of arms, etc.

<addDesc> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.msInline → <heraldry>

**<identifier>** An alpha-numeric string that establishes the identity of the described material.

<addDesc> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.identifierLike → <identifier>

**<lb>** An empty formatting element that forces text to begin on a new line.

<addDesc> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.lbLike → <lb>

**<locus>** Defines a location within a manuscript or manuscript component, usually as a (possibly discontinuous) sequence of folio references.

<addDesc> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.msInline → <locus>

**<locusGrp>** Groups locations which together form a distinct but discontinuous item within a manuscript or manuscript part, according to a specific foliation.

<addDesc> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.msInline → <locusGrp>

**<name>** Proper noun or noun phrase.

<addDesc> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.nameLike → <name>

**<num>** Numeric information in any form.

<addDesc> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.measurementLike → model.numLike → <num>

**<p>** One or more text phrases that form a logical prose passage.

<addDesc> → macro.struc-unstrucContent → model.pLike → <p>

**<periodName>** A label that describes a period of time, such as 'Baroque' or '3rd Style period'.

<addDesc> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.nameLike.label → <periodName>

**<persName>** Designation for an individual, including any or all of that individual's forenames, surnames, honorific titles, and added names.

<addDesc> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.nameLike → model.nameLike.agent → <persName>

**<postBox>** (postal box or post office box) contains a number or other identifier for some postal delivery point other than a street address.

<addDesc> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.addressPart → <postBox>

**<postCode>** (postal code) contains a numerical or alphanumeric code used as part of a postal address to simplify sorting or delivery of mail.

<addDesc> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.addressPart → <postCode>

**<ptr>** Defines a traversible pointer to another location, using only attributes to describe the destination.

<addDesc> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.locrefLike → <ptr>

**<q>** Contains material which is distinguished from the surrounding phrase-level text using quotation marks or a similar method. Use <quote> for block-level quotations.

<addDesc> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.qLike → <q>

**<ref>** Defines a traversible reference to another location. May contain text and sub-elements that describe the destination.

<addDesc> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.locrefLike → <ref>

**<region>** Contains the name of an administrative unit such as a state, province, or county, larger than a settlement, but smaller than a country.

<addDesc> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <region>

**<relation>** Describes a relationship or linkage amongst entities.

<addDesc> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.relationLike → <relation>

**<relationList>** Gathers relation elements.

<addDesc> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.relationLike → <relationList>

**<rend>** A formatting element indicating special visual rendering, e.g., bold or italicized, of a text word or phrase.

<addDesc> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.rendLike → <rend>

**<repository>** Institution, agency, or individual which holds a bibliographic item.

<addDesc> → macro.struc-

unstrucContent → model.textPhraseLike.limited → model.nameLike → model.nameLike.place → model.repositoryLike → <repository>

**<secFolio>** Marks the word or words taken from a fixed point in a codex (typically the beginning of the second leaf) in order to provide a unique identifier for the item.

<addDesc> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.msInline → <secFolio>

**<seg>** (arbitrary segment) represents any segmentation of text below the "text component" level.

<addDesc> → macro.struc-unstrucContent → model.textPhraseLike.limited → <seg>

**<settlement>** Contains the name of a settlement such as a city, town, or village identified as a single geopolitical or administrative unit.

<addDesc> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <settlement>

**<signatures>** Provides a description of the leaf or quire signatures found within a codex.

<addDesc> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.msInline → <signatures>

**<stack>** An inline table with a single column.

<addDesc> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.rendLike → <stack>

**<stamp>** Contains a word or phrase describing an official mark indicating ownership, genuineness, validity, etc.

<addDesc> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.msInline → <stamp>

**<street>** full street address including any name or number identifying a building as well as the name of the street or route on which it is located.

<addDesc> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.addressPart → <street>

**<styleName>** A label for a characteristic style of writing or performance, such as 'bebop' or 'rock-n-roll'.

<addDesc> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.nameLike.label → <styleName>

**<symbol>** A reference to a previously defined symbol.

<addDesc> → macro.struc-unstrucContent → model.textPhraseLike.limited → <symbol>

**<term>** Keyword or phrase which describes a resource.

<addDesc> → macro.struc-unstrucContent → model.textPhraseLike.limited → <term>

**<title>** Title of a bibliographic entity.

<addDesc> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.titleLike → <title>

**<watermark>** Contains a description of a watermark or similar device.

<addDesc> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.msInline → <watermark>

<width> Description of the horizontal size of an object.

<addDesc> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.dimLike → <width>

## Remarks

The model of this element is based on the [additions](#) element of the Text Encoding Initiative (TEI).

## Declaration

```
<elementSpec ident="addDesc" module="MEI.msDesc">

## <addName>

(additional name) – Contains an additional name component, such as a nickname, epithet, or alias, or any other descriptive phrase used within a personal name.

### Module

[MEI.namesdates](#)

### Attributes

**@analog** (*optional*) Contains a reference to a field or element in another descriptive encoding system to which this MEI element is comparable. Value is plain text.

<addName> → [att.bibl](#) → @analog

**@auth** (*optional*) A name or label associated with a controlled vocabulary or other authoritative source for this element or its content. Value is plain text.

<addName> → [att.name](#) → [att.authorized](#) → @auth

**@auth.uri** (*optional*) A web-accessible location of the controlled vocabulary or other authoritative source of identification or definition for this element or its content. This attribute may contain a complete URI or a partial URI which is completed by the value of the codedval attribute. Value conforms to [data.URI](#).  
<addName> → [att.name](#) → [att.authorized](#) → @auth.uri

**@cert** (*optional*) Signifies the degree of certainty or precision associated with a feature. Value conforms to [data.CERTAINTY](#).

<addName> → [att.edit](#) → [att.evidence](#) → @cert

**@class** (*optional*) Contains one or more URIs which denote classification terms that apply to the entity bearing this attribute. One or more values from [data.URI](#), separated by spaces.

<addName> → [att.common](#) → [att.typed](#) → [att.classed](#) → @class

**@codedval** (*optional*) A value that represents or identifies other data. Often, it is a primary key in the database or a unique value in the coded list identified by the auth or auth.uri attributes. One or more values of datatype **NMTOKEN**, separated by spaces.

<addName> → [att.name](#) → [att.authorized](#) → [att.canonical](#) → @codedval

**@copyof** (*optional*) Points to an element of which the current element is a copy. Value conforms to [data.URI](#).

<addName> → [att.common](#) → [att.linking](#) → @copyof

**@corresp** (*optional*) Used to point to other elements that correspond to this one in a generic fashion. One or more values from [data.URI](#), separated by spaces.

<addName> → [att.common](#) → [att.linking](#) → @corresp

**@enddate** (*optional*) Contains the end point of a date range in standard ISO form. Value conforms to [data.ISODATE](#).

<addName> → [att.name](#) → [att.datable](#) → @enddate

**@evidence** (*optional*) Indicates the nature of the evidence supporting the reliability or accuracy of the intervention or interpretation. Allowed values are: "**internal**" (*There is evidence within the document to support the intervention.*), "**external**" (*There is evidence outside the document to support the intervention.*),

"**conjecture**" (*The assertion has been made by the editor, cataloguer, or scholar on the basis of their expertise.*)

<addName> → [att.edit](#) → [att.evidence](#) → @evidence

**@facs** (*optional*) Points to one or more images, portions of an image, or surfaces which correspond to the current element. One or more values from [data.URI](#), separated by spaces.

<addName> → [att.facsimile](#) → @facs

**@follows** (*optional*) points to one or more events in a user-defined collection that are known to be predecessors of the current element. One or more values from [data.URI](#), separated by spaces.

<addName> → [att.common](#) → [att.linking](#) → @follows

**@isodate** (*optional*) Provides the value of a textual date in standard ISO form. Value conforms to [data.ISODATE](#).

<addName> → [att.name](#) → [att.datable](#) → @isodate

**@label** (*optional*) Captures text to be used to generate a label for the element to which it's attached, a "tool tip" or prefatory text, for example. Should not be used to record document content. Value is plain text.

<addName> → [att.common](#) → [att.labelled](#) → @label

**@n** (*optional*) Provides a number-like designation that indicates an element's position in a sequence of similar elements. May not contain space characters. Value conforms to [data.WORD](#).

<addName> → [att.common](#) → [att.nNumberLike](#) → @n

**@next** (*optional*) Used to point to the next event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<addName> → [att.common](#) → [att.linking](#) → @next

**@nonfiling** (*optional*) Holds the number of initial characters (such as those constituting an article or preposition) that should not be used for sorting a title or name. Value is a positive integer.

<addName> → [att.name](#) → [att.filing](#) → @nonfiling

**@notafter** (*optional*) Contains an upper boundary for an uncertain date in standard ISO form. Value conforms to [data.ISODATE](#).

<addName> → [att.name](#) → [att.datable](#) → @notafter

**@notbefore** (*optional*) Contains a lower boundary, in standard ISO form, for an uncertain date. Value conforms to [data.ISODATE](#).

<addName> → [att.name](#) → [att.datable](#) → @notbefore

**@nymref** (*optional*) Used to record a pointer to the regularized form of the name elsewhere in the document. Value conforms to [data.URI](#).

<addName> → [att.name](#) → @nymref

**@precedes** (*optional*) Points to one or more events in a user-defined collection that are known to be successors of the current element. One or more values from [data.URI](#), separated by spaces.

<addName> → [att.common](#) → [att.linking](#) → @precedes

**@prev** (*optional*) Points to the previous event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<addName> → [att.common](#) → [att.linking](#) → @prev

**@resp** (*optional*) Indicates the agent(s) responsible for some aspect of the text's transcription, editing, or encoding. Its value must point to one or more identifiers declared in the document header. One or more values from [data.URI](#), separated by spaces.

<addName> → [att.common](#) → [att.responsibility](#) → @resp

**@role** (*optional*) Used to specify further information about the entity referenced by this name, for example, the occupation of a person or the status of a place. Value is plain text.

<addName> → att.name → @role

**@sameas** (*optional*) Points to an element that is the same as the current element but is not a literal copy of the current element. One or more values from [data.URI](#), separated by spaces.

<addName> → att.common → att.linking → @sameas

**@source** (*optional*) Contains a list of one or more pointers indicating the sources which attest to a given reading. Each value should correspond to the ID of a <source> or <manifestation> element located in the document header. One or more values from [data.URI](#), separated by spaces.

<addName> → att.edit → att.source → @source

**@startdate** (*optional*) Contains the starting point of a date range in standard ISO form. Value conforms to [data.ISODATE](#).

<addName> → att.name → att.datable → @startdate

**@synch** (*optional*) Points to elements that are synchronous with the current element. One or more values from [data.URI](#), separated by spaces.

<addName> → att.common → att.linking → @synch

**@translit** (*optional*) Specifies the transliteration technique used. Value is a [NMTOKEN](#).

<addName> → att.lang → @translit

**@type** (*optional*) Designation which characterizes the element in some sense, using any convenient classification scheme or typology that employs single-token labels. One or more values of datatype **NMTOKEN**, separated by spaces.

<addName> → att.common → att.typed → @type

**@xml:base** (*optional*) Provides a base URI reference with which applications can resolve relative URI references into absolute URI references. Value conforms to [data.URI](#).

<addName> → att.common → att.basic → @xml:base

**@xml:id** (*optional*) Regularizes the naming of an element and thus facilitates building links between it and other resources. Each id attribute within a document must have a unique value. Value is a valid [xml:id](#).

<addName> → att.common → att.basic → att.id → @xml:id

**@xml:lang** (*optional*) Identifies the language of the element's content. The values for this attribute are language 'tags' as defined in BCP 47. All language tags that make use of private use sub-tags must be documented in a corresponding language element in the MEI header whose id attribute is the same as the language tag's value. Value is a [language](#).

<addName> → att.lang → @xml:lang

## Member of

[model.persNamePart](#) Groups elements which form part of a personal name.

## Contained By

**<persName>** Designation for an individual, including any or all of that individual's forenames, surnames, honorific titles, and added names.

<addName> → [model.persNamePart](#) → <persName>

**May Contain**

**<abbr>** A generic element for 1) a shortened form of a word, including an acronym or 2) a shorthand notation.

<addName> → model.textPhraseLike → model.textPhraseLike.limited → model.editorialLike → <abbr>

**<add>** Marks an addition to the text.

<addName> → model.transcriptionLike → <add>

**<address>** Contains a postal address, for example of a publisher, an organization, or an individual.

<addName> → model.textPhraseLike → model.textPhraseLike.limited → model.addressLike → <address>

**<annot>** Provides a statement explaining the text or indicating the basis for an assertion.

<addName> → model.textPhraseLike → model.textPhraseLike.limited → model.annotLike → <annot>

**<bibl>** Provides a loosely-structured bibliographic citation in which the sub-components may or may not be explicitly marked.

<addName> → model.textPhraseLike → model.textPhraseLike.limited → model.biblLike → <bibl>

**<biblStruct>** Contains a bibliographic citation in which bibliographic sub-elements must appear in a specified order.

<addName> → model.textPhraseLike → model.textPhraseLike.limited → model.biblLike → <biblStruct>

**<bloc>** Contains the name of a geopolitical unit consisting of two or more nation states or countries.

<addName> → model.textPhraseLike → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <bloc>

**<catchwords>** Describes the system used to ensure correct ordering of the quires making up an item, typically by means of annotations at the foot of the page.

<addName> → model.textPhraseLike → model.textPhraseLike.limited → model.mslnline → <catchwords>

**<choice>** Groups a number of alternative encodings for the same point in a text.

<addName> → model.editLike → <choice>

**<corpName>** Identifies an organization or group of people that acts as a single entity.

<addName> → model.textPhraseLike → model.textPhraseLike.limited → model.nameLike → model.nameLike.agent → <corpName>

**<corr>** Contains the correct form of an apparent erroneous passage.

<addName> → model.transcriptionLike → <corr>

**<country>** Contains the name of a geopolitical unit, such as a nation, country, colony, or commonwealth, larger than or administratively superior to a region and smaller than a bloc.

<addName> → model.textPhraseLike → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <country>

**<damage>** Contains an area of damage to the physical medium.

<addName> → model.transcriptionLike → <damage>

**<date>** A string identifying a point in time or the time period between two such points.

<addName> → model.textPhraseLike → model.textPhraseLike.limited → model.dateLike → <date>

**<dedicatee>** Entity to whom a creative work is formally offered.

<addName> → model.textPhraseLike → model.textPhraseLike.limited → <dedicatee>

**<del>** Contains information deleted, marked as deleted, or otherwise indicated as superfluous or spurious in the copy text by an author, scribe, annotator, or corrector.

<addName> → model.transcriptionLike → <del>

**<depth>** Description of a measurement taken through a three-dimensional object.

<addName> → model.textPhraseLike → model.textPhraseLike.limited → model.dimLike → <depth>

**<dim>** Any single dimensional specification.

<addName> → model.textPhraseLike → model.textPhraseLike.limited → model.dimLike → <dim>

**<dimensions>** Information about the physical size of an entity; usually includes numerical data.

<addName> → model.textPhraseLike → model.textPhraseLike.limited → <dimensions>

**<district>** Contains the name of any kind of subdivision of a settlement, such as a parish, ward, or other administrative or geographic unit.

<addName> → model.textPhraseLike → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <district>

**<expan>** Contains the expansion of an abbreviation.

<addName> → model.textPhraseLike → model.textPhraseLike.limited → model.editorialLike → <expan>

**<extent>** Used to express size in terms other than physical dimensions, such as number of pages, records, bytes, physical components, etc.

<addName> → model.textPhraseLike → model.textPhraseLike.limited → <extent>

**<fig>** Groups elements representing or containing graphic information such as an illustration or figure.

<addName> → model.textPhraseLike → model.textPhraseLike.limited → model.figureLike → <fig>

**<gap>** Indicates a point where material has been omitted in a transcription, whether as part of sampling practice or for editorial reasons described in the MEI header.

<addName> → model.transcriptionLike → <gap>

**<geogFeat>** Contains a common noun identifying a geographical feature.

<addName> → model.textPhraseLike → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <geogFeat>

**<geogName>** The proper noun designation for a place, natural feature, or political jurisdiction.

<addName> → model.textPhraseLike → model.textPhraseLike.limited → model.nameLike → model.nameLike.place → model.nameLike.geogName → <geogName>

**<handShift>** Marks the beginning of a passage written in a new hand, or of a change in the scribe, writing style, ink or character of the document hand.

<addName> → model.transcriptionLike → <handShift>

**<height>** Description of the vertical size of an object.

<addName> → model.textPhraseLike → model.textPhraseLike.limited → model.dimLike → <height>

**<heraldry>** Contains a heraldic formula or phrase, typically found as part of a blazon, coat of arms, etc.

<addName> → model.textPhraseLike → model.textPhraseLike.limited → model.msInline → <heraldry>

**<identifier>** An alpha-numeric string that establishes the identity of the described material.

<addName> → model.textPhraseLike → model.textPhraseLike.limited → model.identifierLike → <identifier>

**<lb>** An empty formatting element that forces text to begin on a new line.

<addName> → model.textPhraseLike → model.textPhraseLike.limited → model.lbLike → <lb>

**<locus>** Defines a location within a manuscript or manuscript component, usually as a (possibly discontinuous) sequence of folio references.

<addName> → model.textPhraseLike → model.textPhraseLike.limited → model.msInline → <locus>

**<locusGrp>** Groups locations which together form a distinct but discontinuous item within a manuscript or manuscript part, according to a specific foliation.

<addName> → model.textPhraseLike → model.textPhraseLike.limited → model.msInline → <locusGrp>

**<name>** Proper noun or noun phrase.

<addName> → model.textPhraseLike → model.textPhraseLike.limited → model.nameLike → <name>

**<num>** Numeric information in any form.

<addName> → model.textPhraseLike → model.textPhraseLike.limited → model.measurementLike → model.numLike → <num>

**<orig>** Contains material which is marked as following the original, rather than being normalized or corrected.

<addName> → model.transcriptionLike → <orig>

**<pb>** An empty formatting element that forces text to begin on a new page.

<addName> → model.textPhraseLike → model.pbLike → <pb>

**<periodName>** A label that describes a period of time, such as 'Baroque' or '3rd Style period'.

<addName> → model.textPhraseLike → model.textPhraseLike.limited → model.nameLike.label → <periodName>

**<persName>** Designation for an individual, including any or all of that individual's forenames, surnames, honorific titles, and added names.

<addName> → model.textPhraseLike → model.textPhraseLike.limited → model.nameLike → model.nameLike.agent → <persName>

**<postBox>** (postal box or post office box) contains a number or other identifier for some postal delivery point other than a street address.

<addName> → model.textPhraseLike → model.textPhraseLike.limited → model.addressPart → <postBox>

**<postCode>** (postal code) contains a numerical or alphanumeric code used as part of a postal address to simplify sorting or delivery of mail.

<addName> → model.textPhraseLike → model.textPhraseLike.limited → model.addressPart → <postCode>

**<ptr>** Defines a traversible pointer to another location, using only attributes to describe the destination.

<addName> → model.textPhraseLike → model.textPhraseLike.limited → model.locrefLike → <ptr>

**<q>** Contains material which is distinguished from the surrounding phrase-level text using quotation marks or a similar method. Use <quote> for block-level quotations.

<addName> → model.textPhraseLike → model.textPhraseLike.limited → model.qLike → <q>

**<ref>** Defines a traversible reference to another location. May contain text and sub-elements that describe the destination.

<addName> → model.textPhraseLike → model.textPhraseLike.limited → model.locrefLike → <ref>

**<reg>** Contains material which has been regularized or normalized in some sense.

<addName> → model.transcriptionLike → <reg>

**<region>** Contains the name of an administrative unit such as a state, province, or county, larger than a settlement, but smaller than a country.

<addName> → model.textPhraseLike → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <region>

**<relation>** Describes a relationship or linkage amongst entities.

<addName> → model.textPhraseLike → model.textPhraseLike.limited → model.relationLike → <relation>

**<relationList>** Gathers relation elements.

<addName> → model.textPhraseLike → model.textPhraseLike.limited → model.relationLike → <relationList>

**<rend>** A formatting element indicating special visual rendering, e.g., bold or italicized, of a text word or phrase.

<addName> → model.textPhraseLike → model.textPhraseLike.limited → model.rendLike → <rend>

**<repository>** Institution, agency, or individual which holds a bibliographic item.

<addName> → model.textPhraseLike → model.textPhraseLike.limited → model.nameLike → model.nameLike.place → model.repositoryLike → <repository>

**<restore>** Indicates restoration of material to an earlier state by cancellation of an editorial or authorial marking or instruction.

<addName> → model.transcriptionLike → <restore>

**<secFolio>** Marks the word or words taken from a fixed point in a codex (typically the beginning of the second leaf) in order to provide a unique identifier for the item.

<addName> → model.textPhraseLike → model.textPhraseLike.limited → model.msInline → <secFolio>

**<seg>** (arbitrary segment) represents any segmentation of text below the "text component" level.

<addName> → model.textPhraseLike → model.textPhraseLike.limited → <seg>

**<settlement>** Contains the name of a settlement such as a city, town, or village identified as a single geopolitical or administrative unit.

<addName> → model.textPhraseLike → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <settlement>

**<sic>** Contains apparently incorrect or inaccurate material.

<addName> → model.transcriptionLike → <sic>

**<signatures>** Provides a description of the leaf or quire signatures found within a codex.

<addName> → model.textPhraseLike → model.textPhraseLike.limited → model.msInline → <signatures>

**<stack>** An inline table with a single column.

<addName> → model.textPhraseLike → model.textPhraseLike.limited → model.rendLike → <stack>

**<stamp>** Contains a word or phrase describing an official mark indicating ownership, genuineness, validity, etc.

<addName> → model.textPhraseLike → model.textPhraseLike.limited → model.msInline → <stamp>

**<street>** full street address including any name or number identifying a building as well as the name of the street or route on which it is located.

<addName> → model.textPhraseLike → model.textPhraseLike.limited → model.addressPart → <street>

**<styleName>** A label for a characteristic style of writing or performance, such as 'bebop' or 'rock-n-roll'.

<addName> → model.textPhraseLike → model.textPhraseLike.limited → model.nameLike.label → <styleName>

**<subst>** Groups transcriptional elements when the combination is to be regarded as a single intervention in the text.

<addName> → model.editLike → <subst>

**<supplied>** Contains material supplied by the transcriber or editor for any reason.

<addName> → model.transcriptionLike → <supplied>

**<symbol>** A reference to a previously defined symbol.

<addName> → model.textPhraseLike → model.textPhraseLike.limited → <symbol>

**<term>** Keyword or phrase which describes a resource.

<addName> → model.textPhraseLike → model.textPhraseLike.limited → <term>

**<title>** Title of a bibliographic entity.

<addName> → model.textPhraseLike → model.textPhraseLike.limited → model.titleLike → <title>

**<unclear>** Contains material that cannot be transcribed with certainty because it is illegible or inaudible in the source.

<addName> → model.transcriptionLike → <unclear>

**<watermark>** Contains a description of a watermark or similar device.

<addName> → model.textPhraseLike → model.textPhraseLike.limited → model.msInline → <watermark>

**<width>** Description of the horizontal size of an object.

<addName> → model.textPhraseLike → model.textPhraseLike.limited → model.dimLike → <width>

## Remarks

---

The model of this element is based on the [addName](#) element of the Text Encoding Initiative (TEI).

## <addrLine>

(address line) – Single line of a postal address.

### Referenced in chapters

[9.2.11 Addresses](#)

### Module

[MEI.shared](#)

### Attributes

**@class** (*optional*) Contains one or more URIs which denote classification terms that apply to the entity bearing this attribute. One or more values from [data.URI](#), separated by spaces.

<addrLine> → att.common → att.typed → att.classed → @class

**@copyof** (*optional*) Points to an element of which the current element is a copy. Value conforms to [data.URI](#).

<addrLine> → att.common → att.linkin → @copyof

**@corresp** (*optional*) Used to point to other elements that correspond to this one in a generic fashion. One or more values from [data.URI](#), separated by spaces.

<addrLine> → att.common → att.linkin → @corresp

**@facs** (*optional*) Points to one or more images, portions of an image, or surfaces which correspond to the current element. One or more values from [data.URI](#), separated by spaces.

<addrLine> → att.facsimile → @facs

**@follows** (*optional*) points to one or more events in a user-defined collection that are known to be predecessors of the current element. One or more values from [data.URI](#), separated by spaces.

<addrLine> → att.common → att.linkin → @follows

**@label** (*optional*) Captures text to be used to generate a label for the element to which it's attached, a "tool tip" or prefatory text, for example. Should not be used to record document content. Value is plain text.

<addrLine> → att.common → att.labelled → @label

**@n** (*optional*) Provides a number-like designation that indicates an element's position in a sequence of similar elements. May not contain space characters. Value conforms to [data.WORD](#).

<addrLine> → att.common → att.nNumberLike → @n

**@next** (*optional*) Used to point to the next event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<addrLine> → att.common → att.linkin → @next

**@precedes** (*optional*) Points to one or more events in a user-defined collection that are known to be successors of the current element. One or more values from [data.URI](#), separated by spaces.

<addrLine> → att.common → att.linkin → @precedes

**@prev** (*optional*) Points to the previous event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<addrLine> → att.common → att.linkin → @prev

**@resp** (*optional*) Indicates the agent(s) responsible for some aspect of the text's transcription, editing, or encoding. Its value must point to one or more identifiers declared in the document header. One or more values from [data.URI](#), separated by spaces.

<addrLine> → att.common → att.responsibility → @resp

**@sameas** (*optional*) Points to an element that is the same as the current element but is not a literal copy of the current element. One or more values from [data.URI](#), separated by spaces.

<addrLine> → att.common → att.linking → @sameas

**@synch** (*optional*) Points to elements that are synchronous with the current element. One or more values from [data.URI](#), separated by spaces.

<addrLine> → att.common → att.linking → @synch

**@translit** (*optional*) Specifies the transliteration technique used. Value is a [NMOKEN](#).

<addrLine> → att.lang → @translit

**@type** (*optional*) Designation which characterizes the element in some sense, using any convenient classification scheme or typology that employs single-token labels. One or more values of datatype [NMOKEN](#), separated by spaces.

<addrLine> → att.common → att.typed → @type

**@xml:base** (*optional*) Provides a base URI reference with which applications can resolve relative URI references into absolute URI references. Value conforms to [data.URI](#).

<addrLine> → att.common → att.basic → @xml:base

**@xml:id** (*optional*) Regularizes the naming of an element and thus facilitates building links between it and other resources. Each id attribute within a document must have a unique value. Value is a valid [xml:id](#).

<addrLine> → att.common → att.basic → att.id → @xml:id

**@xml:lang** (*optional*) Identifies the language of the element's content. The values for this attribute are language 'tags' as defined in BCP 47. All language tags that make use of private use sub-tags must be documented in a corresponding language element in the MEI header whose id attribute is the same as the language tag's value. Value is a [language](#).

<addrLine> → att.lang → @xml:lang

## Member of

(addrLine isn't member of any model class)

## Contained By

**<address>** Contains a postal address, for example of a publisher, an organization, or an individual.

<addrLine> → elements having addrLine as direct children → <address>

## May Contain

**<abbr>** A generic element for 1) a shortened form of a word, including an acronym or 2) a shorthand notation.

<addrLine> → model.textPhraseLike → model.textPhraseLike.limited → model.editorialLike → <abbr>

**<add>** Marks an addition to the text.

<addrLine> → model.transcriptionLike → <add>

**<address>** Contains a postal address, for example of a publisher, an organization, or an individual.

<addrLine> → model.textPhraseLike → model.textPhraseLike.limited → model.addressLike → <address>

**<annot>** Provides a statement explaining the text or indicating the basis for an assertion.

<addrLine> → model.textPhraseLike → model.textPhraseLike.limited → model.annotLike → <annot>

**<bibl>** Provides a loosely-structured bibliographic citation in which the sub-components may or may not be explicitly marked.

<addrLine> → model.textPhraseLike → model.textPhraseLike.limited → model.biblLike → <bibl>

**<biblStruct>** Contains a bibliographic citation in which bibliographic sub-elements must appear in a specified order.

<addrLine> → model.textPhraseLike → model.textPhraseLike.limited → model.biblLike → <biblStruct>

**<bloc>** Contains the name of a geopolitical unit consisting of two or more nation states or countries.

<addrLine> → model.textPhraseLike → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <bloc>

**<catchwords>** Describes the system used to ensure correct ordering of the quires making up an item, typically by means of annotations at the foot of the page.

<addrLine> → model.textPhraseLike → model.textPhraseLike.limited → model.mslinline → <catchwords>

**<choice>** Groups a number of alternative encodings for the same point in a text.

<addrLine> → model.editLike → <choice>

**<corpName>** Identifies an organization or group of people that acts as a single entity.

<addrLine> → model.textPhraseLike → model.textPhraseLike.limited → model.nameLike → model.nameLike.agent → <corpName>

**<corr>** Contains the correct form of an apparent erroneous passage.

<addrLine> → model.transcriptionLike → <corr>

**<country>** Contains the name of a geopolitical unit, such as a nation, country, colony, or commonwealth, larger than or administratively superior to a region and smaller than a bloc.

<addrLine> → model.textPhraseLike → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <country>

**<damage>** Contains an area of damage to the physical medium.

<addrLine> → model.transcriptionLike → <damage>

**<date>** A string identifying a point in time or the time period between two such points.

<addrLine> → model.textPhraseLike → model.textPhraseLike.limited → model.dateLike → <date>

**<dedicatee>** Entity to whom a creative work is formally offered.

<addrLine> → model.textPhraseLike → model.textPhraseLike.limited → <dedicatee>

**<del>** Contains information deleted, marked as deleted, or otherwise indicated as superfluous or spurious in the copy text by an author, scribe, annotator, or corrector.

<addrLine> → model.transcriptionLike → <del>

**<depth>** Description of a measurement taken through a three-dimensional object.

<addrLine> → model.textPhraseLike → model.textPhraseLike.limited → model.dimLike → <depth>

**<dim>** Any single dimensional specification.

<addrLine> → model.textPhraseLike → model.textPhraseLike.limited → model.dimLike → <dim>

**<dimensions>** Information about the physical size of an entity; usually includes numerical data.

<addrLine> → model.textPhraseLike → model.textPhraseLike.limited → <dimensions>

**<district>** Contains the name of any kind of subdivision of a settlement, such as a parish, ward, or other administrative or geographic unit.

<addrLine> → model.textPhraseLike → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <district>

**<expan>** Contains the expansion of an abbreviation.

<addrLine> → model.textPhraseLike → model.textPhraseLike.limited → model.editorialLike → <expan>

**<extent>** Used to express size in terms other than physical dimensions, such as number of pages, records, bytes, physical components, etc.

<addrLine> → model.textPhraseLike → model.textPhraseLike.limited → <extent>

**<fig>** Groups elements representing or containing graphic information such as an illustration or figure.

<addrLine> → model.textPhraseLike → model.textPhraseLike.limited → model.figureLike → <fig>

**<gap>** Indicates a point where material has been omitted in a transcription, whether as part of sampling practice or for editorial reasons described in the MEI header.

<addrLine> → model.transcriptionLike → <gap>

**<geogFeat>** Contains a common noun identifying a geographical feature.

<addrLine> → model.textPhraseLike → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <geogFeat>

**<geogName>** The proper noun designation for a place, natural feature, or political jurisdiction.

<addrLine> → model.textPhraseLike → model.textPhraseLike.limited → model.nameLike → model.nameLike.place → model.nameLike.geogName → <geogNa

**<handShift>** Marks the beginning of a passage written in a new hand, or of a change in the scribe, writing style, ink or character of the document hand.

<addrLine> → model.transcriptionLike → <handShift>

**<height>** Description of the vertical size of an object.

<addrLine> → model.textPhraseLike → model.textPhraseLike.limited → model.dimLike → <height>

**<heraldry>** Contains a heraldic formula or phrase, typically found as part of a blazon, coat of arms, etc.

<addrLine> → model.textPhraseLike → model.textPhraseLike.limited → model.msInline → <heraldry>

**<identifier>** An alpha-numeric string that establishes the identity of the described material.

<addrLine> → model.textPhraseLike → model.textPhraseLike.limited → model.identifierLike → <identifier>

**<lb>** An empty formatting element that forces text to begin on a new line.

<addrLine> → model.textPhraseLike → model.textPhraseLike.limited → model.lbLike → <lb>

**<locus>** Defines a location within a manuscript or manuscript component, usually as a (possibly discontinuous) sequence of folio references.

<addrLine> → model.textPhraseLike → model.textPhraseLike.limited → model.msInline → <locus>

**<locusGrp>** Groups locations which together form a distinct but discontinuous item within a manuscript or manuscript part, according to a specific foliation.

<addrLine> → model.textPhraseLike → model.textPhraseLike.limited → model.msInline → <locusGrp>

**<name>** Proper noun or noun phrase.

<addrLine> → model.textPhraseLike → model.textPhraseLike.limited → model.nameLike → <name>

**<num>** Numeric information in any form.

<addrLine> → model.textPhraseLike → model.textPhraseLike.limited → model.measurementLike → model.numLike → <num>

**<orig>** Contains material which is marked as following the original, rather than being normalized or corrected.

<addrLine> → model.transcriptionLike → <orig>

**<pb>** An empty formatting element that forces text to begin on a new page.

<addrLine> → model.textPhraseLike → model.pbLike → <pb>

**<periodName>** A label that describes a period of time, such as 'Baroque' or '3rd Style period'.

<addrLine> → model.textPhraseLike → model.textPhraseLike.limited → model.nameLike.label → <periodName>

**<persName>** Designation for an individual, including any or all of that individual's forenames, surnames, honorific titles, and added names.

<addrLine> → model.textPhraseLike → model.textPhraseLike.limited → model.nameLike → model.nameLike.agent → <persName>

**<postBox>** (postal box or post office box) contains a number or other identifier for some postal delivery point other than a street address.

<addrLine> → model.textPhraseLike → model.textPhraseLike.limited → model.addressPart → <postBox>

**<postCode>** (postal code) contains a numerical or alphanumeric code used as part of a postal address to simplify sorting or delivery of mail.

<addrLine> → model.textPhraseLike → model.textPhraseLike.limited → model.addressPart → <postCode>

**<ptr>** Defines a traversible pointer to another location, using only attributes to describe the destination.

<addrLine> → model.textPhraseLike → model.textPhraseLike.limited → model.locrefLike → <ptr>

**<q>** Contains material which is distinguished from the surrounding phrase-level text using quotation marks or a similar method. Use <quote> for block-level quotations.

<addrLine> → model.textPhraseLike → model.textPhraseLike.limited → model.qLike → <q>

**<ref>** Defines a traversible reference to another location. May contain text and sub-elements that describe the destination.

<addrLine> → model.textPhraseLike → model.textPhraseLike.limited → model.locrefLike → <ref>

**<reg>** Contains material which has been regularized or normalized in some sense.

<addrLine> → model.transcriptionLike → <reg>

**<region>** Contains the name of an administrative unit such as a state, province, or county, larger than a settlement, but smaller than a country.

<addrLine> → model.textPhraseLike → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <region>

**<relation>** Describes a relationship or linkage amongst entities.

<addrLine> → model.textPhraseLike → model.textPhraseLike.limited → model.relationLike → <relation>

**<relationList>** Gathers relation elements.

<addrLine> → model.textPhraseLike → model.textPhraseLike.limited → model.relationLike → <relationList>

**<rend>** A formatting element indicating special visual rendering, e.g., bold or italicized, of a text word or phrase.

<addrLine> → model.textPhraseLike → model.textPhraseLike.limited → model.rendLike → <rend>

**<repository>** Institution, agency, or individual which holds a bibliographic item.

<addrLine> → model.textPhraseLike → model.textPhraseLike.limited → model.nameLike → model.nameLike.place → model.repositoryLike → <repository>

**<restore>** Indicates restoration of material to an earlier state by cancellation of an editorial or authorial marking or instruction.

<addrLine> → model.transcriptionLike → <restore>

**<secFolio>** Marks the word or words taken from a fixed point in a codex (typically the beginning of the second leaf) in order to provide a unique identifier for the item.

<addrLine> → model.textPhraseLike → model.textPhraseLike.limited → model.msInline → <secFolio>

**<seg>** (arbitrary segment) represents any segmentation of text below the "text component" level.

<addrLine> → model.textPhraseLike → model.textPhraseLike.limited → <seg>

**<settlement>** Contains the name of a settlement such as a city, town, or village identified as a single geopolitical or administrative unit.

<addrLine> → model.textPhraseLike → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <settlement>

**<sic>** Contains apparently incorrect or inaccurate material.

<addrLine> → model.transcriptionLike → <sic>

**<signatures>** Provides a description of the leaf or quire signatures found within a codex.

<addrLine> → model.textPhraseLike → model.textPhraseLike.limited → model.msInline → <signatures>

**<stack>** An inline table with a single column.

<addrLine> → model.textPhraseLike → model.textPhraseLike.limited → model.renderLike → <stack>

**<stamp>** Contains a word or phrase describing an official mark indicating ownership, genuineness, validity, etc.

<addrLine> → model.textPhraseLike → model.textPhraseLike.limited → model.msInline → <stamp>

**<street>** full street address including any name or number identifying a building as well as the name of the street or route on which it is located.

<addrLine> → model.textPhraseLike → model.textPhraseLike.limited → model.addressPart → <street>

**<styleName>** A label for a characteristic style of writing or performance, such as 'bebop' or 'rock-n-roll'.

<addrLine> → model.textPhraseLike → model.textPhraseLike.limited → model.nameLike.label → <styleName>

**<subst>** Groups transcriptional elements when the combination is to be regarded as a single intervention in the text.

<addrLine> → model.editLike → <subst>

**<supplied>** Contains material supplied by the transcriber or editor for any reason.

<addrLine> → model.transcriptionLike → <supplied>

**<symbol>** A reference to a previously defined symbol.

<addrLine> → model.textPhraseLike → model.textPhraseLike.limited → <symbol>

**<term>** Keyword or phrase which describes a resource.

<addrLine> → model.textPhraseLike → model.textPhraseLike.limited → <term>

**<title>** Title of a bibliographic entity.

<addrLine> → model.textPhraseLike → model.textPhraseLike.limited → model.titleLike → <title>

**<unclear>** Contains material that cannot be transcribed with certainty because it is illegible or inaudible in the source.

<addrLine> → model.transcriptionLike → <unclear>

**<watermark>** Contains a description of a watermark or similar device.

<addrLine> → model.textPhraseLike → model.textPhraseLike.limited → model.msInline → <watermark>

**<width>** Description of the horizontal size of an object.

<addrLine> → model.textPhraseLike → model.textPhraseLike.limited → model.dimLike → <width>

## Remarks

<addrLine> may be repeated as many times as necessary to enter all lines of an address.

The model of this element is based on the [addrLine](#) element of the Text Encoding Initiative (TEI) and the [addressline](#) element of the Encoded Archival Description (EAD).

**@n** (*optional*) Provides a number-like designation that indicates an element's position in a sequence of similar elements. May not contain space characters. Value conforms to [data.WORD](#).

<address> → [att.common](#) → [att.nNumberLike](#) → @n

**@next** (*optional*) Used to point to the next event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<address> → [att.common](#) → [att.linking](#) → @next

**@precedes** (*optional*) Points to one or more events in a user-defined collection that are known to be successors of the current element. One or more values from [data.URI](#), separated by spaces.

<address> → [att.common](#) → [att.linking](#) → @precedes

**@prev** (*optional*) Points to the previous event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<address> → [att.common](#) → [att.linking](#) → @prev

**@resp** (*optional*) Indicates the agent(s) responsible for some aspect of the text's transcription, editing, or encoding. Its value must point to one or more identifiers declared in the document header. One or more values from [data.URI](#), separated by spaces.

<address> → [att.common](#) → [att.responsibility](#) → @resp

**@sameas** (*optional*) Points to an element that is the same as the current element but is not a literal copy of the current element. One or more values from [data.URI](#), separated by spaces.

<address> → [att.common](#) → [att.linking](#) → @sameas

**@synch** (*optional*) Points to elements that are synchronous with the current element. One or more values from [data.URI](#), separated by spaces.

<address> → [att.common](#) → [att.linking](#) → @synch

**@translit** (*optional*) Specifies the transliteration technique used. Value is a [NMOKEN](#).

<address> → [att.common](#) → [att.lang](#) → @translit

**@type** (*optional*) Designation which characterizes the element in some sense, using any convenient classification scheme or typology that employs single-token labels. One or more values of datatype [NMOKEN](#), separated by spaces.

<address> → [att.common](#) → [att.typed](#) → @type

**@xml:base** (*optional*) Provides a base URI reference with which applications can resolve relative URI references into absolute URI references. Value conforms to [data.URI](#).

<address> → [att.common](#) → [att.basic](#) → @xml:base

**@xml:id** (*optional*) Regularizes the naming of an element and thus facilitates building links between it and other resources. Each id attribute within a document must have a unique value. Value is a valid [xml:id](#).

<address> → [att.common](#) → [att.basic](#) → [att.id](#) → @xml:id

**@xml:lang** (*optional*) Identifies the language of the element's content. The values for this attribute are language 'tags' as defined in BCP 47. All language tags that make use of private use sub-tags must be documented in a corresponding language element in the MEI header whose id attribute is the same as the language tag's value. Value is a [language](#).

<address> → [att.lang](#) → @xml:lang

## Member of

[model.addressLike](#) Groups elements used to represent a postal address.

## Contained By

**<abbr>** A generic element for 1) a shortened form of a word, including an acronym or 2) a shorthand notation.

<address> → [model.addressLike](#) → [model.textPhraseLike.limited](#) → [model.editTransPart.text](#) → [model.editTransPart](#) → <abbr>

**<acquisition>** Records information concerning the process by which an item was acquired by the holding institution.

<address> → [model.addressLike](#) → [model.textPhraseLike.limited](#) → <acquisition>

**<actor>** Name of an actor appearing within a cast list.

<address> → [model.addressLike](#) → [model.textPhraseLike.limited](#) → <actor>

**<add>** Marks an addition to the text.

<address> → [model.addressLike](#) → [model.textPhraseLike.limited](#) → [model.editTransPart.text](#) → [model.editTransPart](#) → <add>

**<addName>** Contains an additional name component, such as a nickname, epithet, or alias, or any other descriptive phrase used within a personal name.

<address> → model.addressLike → model.textPhraseLike.limited → model.textPhraseLike → <addName>

**<addrLine>** Single line of a postal address.

<address> → model.addressLike → model.textPhraseLike.limited → model.textPhraseLike → <addrLine>

**<anchoredText>** Container for text that is fixed to a particular page location, regardless of changes made to the layout of the measures around it.

<address> → model.addressLike → model.textPhraseLike.limited → <anchoredText>

**<annot>** Provides a statement explaining the text or indicating the basis for an assertion.

<address> → model.addressLike → model.textPhraseLike.limited → model.textPhraseLike → <annot>

**<arranger>** A person or organization who transcribes a musical composition, usually for a different medium from that of the original; in an arrangement the musical substance remains essentially unchanged.

<address> → model.addressLike → model.textPhraseLike.limited → <arranger>

**<attacca>** An instruction to begin the next section or movement of a composition without pause.

<address> → model.addressLike → model.textPhraseLike.limited → <attacca>

**<author>** The name of the creator of the intellectual content of a non-musical, literary work.

<address> → model.addressLike → model.textPhraseLike.limited → <author>

**<bibl>** Provides a loosely-structured bibliographic citation in which the sub-components may or may not be explicitly marked.

<address> → model.addressLike → model.textPhraseLike.limited → model.textPhraseLike → <bibl>

**<biblScope>** Defines the scope of a bibliographic reference, for example as a list of page numbers, or a named subdivision of a larger work.

<address> → model.addressLike → model.textPhraseLike.limited → <biblScope>

**<bindingDesc>** Describes the present and former bindings of an item.

<address> → model.addressLike → model.textPhraseLike.limited → <bindingDesc>

**<bloc>** Contains the name of a geopolitical unit consisting of two or more nation states or countries.

<address> → model.addressLike → model.textPhraseLike.limited → model.textPhraseLike → <bloc>

**<bracketSpan>** Marks a sequence of notational events grouped by a bracket.

<address> → model.addressLike → model.textPhraseLike.limited → <bracketSpan>

**<byline>** Contains the primary statement of responsibility given for a work on its title page.

<address> → model.addressLike → model.textPhraseLike.limited → <byline>

**<caption>** A label which accompanies an illustration or a table.

<address> → model.addressLike → model.textPhraseLike.limited → model.textPhraseLike → <caption>

**<composer>** The name of the creator of the intellectual content of a musical work.

<address> → model.addressLike → model.textPhraseLike.limited → <composer>

**<contentItem>** Contains a single entry within a content description element.

<address> → model.addressLike → model.textPhraseLike.limited → model.textPhraseLike → <contentItem>

**<contributor>** Names of individuals, institutions, or organizations responsible for contributions to the intellectual content of a work, where the specialized elements for authors, editors, etc. do not suffice or do not apply.

<address> → model.addressLike → model.textPhraseLike.limited → <contributor>

**<corpName>** Identifies an organization or group of people that acts as a single entity.

<address> → model.addressLike → model.textPhraseLike.limited → model.textPhraseLike → <corpName>

**<corr>** Contains the correct form of an apparent erroneous passage.

<address> → model.addressLike → model.textPhraseLike.limited → model.editTransPart.text → model.editTransPart → <corr>

**<country>** Contains the name of a geopolitical unit, such as a nation, country, colony, or commonwealth, larger than or administratively superior to a region and smaller than a bloc.

<address> → model.addressLike → model.textPhraseLike.limited → model.textPhraseLike → <country>

**<cpMark>** A verbal or graphical indication to copy musical material written elsewhere.

<address> → model.addressLike → model.textPhraseLike.limited → <cpMark>

**<creation>** Non-bibliographic details of the creation of an intellectual entity, in narrative form, such as the date, place, and circumstances of its composition. More detailed information may be captured within the history element.

<address> → model.addressLike → model.textPhraseLike.limited → <creation>

**<damage>** Contains an area of damage to the physical medium.

<address> → model.addressLike → model.textPhraseLike.limited → model.editTransPart.text → model.editTransPart → <damage>

**<date>** A string identifying a point in time or the time period between two such points.

<address> → model.addressLike → model.textPhraseLike.limited → model.textPhraseLike → <date>

**<decoDesc>** Contains a description of the decoration of an item.

<address> → model.addressLike → model.textPhraseLike.limited → <decoDesc>

**<decoNote>** Contains a description of one or more decorative features of an item.

<address> → model.addressLike → model.textPhraseLike.limited → <decoNote>

**<dedicatee>** Entity to whom a creative work is formally offered.

<address> → model.addressLike → model.textPhraseLike.limited → <dedicatee>

**<dedication>** Contains a dedicatory statement.

<address> → model.addressLike → model.textPhraseLike.limited → <dedication>

**<del>** Contains information deleted, marked as deleted, or otherwise indicated as superfluous or spurious in the copy text by an author, scribe, annotator, or corrector.

<address> → model.addressLike → model.textPhraseLike.limited → model.editTransPart.text → model.editTransPart → <del>

**<depth>** Description of a measurement taken through a three-dimensional object.

<address> → model.addressLike → model.textPhraseLike.limited → <depth>

**<desc>** Container for text that briefly describes the feature to which it is attached, including its intended usage, purpose, or application as appropriate.

<address> → model.addressLike → model.textPhraseLike.limited → <desc>

**<dim>** Any single dimensional specification.

<address> → model.addressLike → model.textPhraseLike.limited → <dim>

**<dir>** An instruction expressed as a combination of text and symbols, typically above, below, or between staves, but not on the staff — that is not encoded elsewhere in more specific elements, like **<tempo>**, **<dynam>** or **<repeatMark>**.

<address> → model.addressLike → model.textPhraseLike.limited → <dir>

**<distributor>** Person or agency, other than a publisher, from which access (including electronic access) to a bibliographic entity may be obtained.

<address> → model.addressLike → model.textPhraseLike.limited → <distributor>

**<district>** Contains the name of any kind of subdivision of a settlement, such as a parish, ward, or other administrative or geographic unit.

<address> → model.addressLike → model.textPhraseLike.limited → model.textPhraseLike → <district>

**<dynam>** Indication of the volume of a note, phrase, or section of music.

<address> → model.addressLike → model.textPhraseLike.limited → <dynam>

**<edition>** A word or text phrase that indicates a difference in either content or form between the item being described and a related item previously issued by the same publisher/distributor (e.g., 2nd edition, version 2.0, etc.), or simultaneously issued by either the same publisher/distributor or another publisher/distributor (e.g., large print edition, British edition, etc.).

<address> → model.addressLike → model.textPhraseLike.limited → <edition>

**<editor>** The name of the individual(s), institution(s) or organization(s) acting in an editorial capacity.

<address> → model.addressLike → model.textPhraseLike.limited → <editor>

**<epigraph>** Contains a quotation, anonymous or attributed, appearing on a title page.

<address> → model.addressLike → model.textPhraseLike.limited → model.textPhraseLike → model.paracontentPart → <epigraph>

**<event>** Contains a free-text event description.

<address> → model.addressLike → model.eventPart → <event>

**<eventList>** Contains historical information given as a sequence of significant past events.

<address> → model.addressLike → <eventList>

**<exhibHist>** A record of public exhibitions, including dates, venues, etc.

<address> → model.addressLike → model.textPhraseLike.limited → <exhibHist>

**<expan>** Contains the expansion of an abbreviation.

<address> → model.addressLike → model.textPhraseLike.limited → model.editTransPart.text → model.editTransPart → <expan>

**<extent>** Used to express size in terms other than physical dimensions, such as number of pages, records, bytes, physical components, etc.

<address> → model.addressLike → model.textPhraseLike.limited → <extent>

**<f>** Single element of a figured bass indication.

<address> → model.addressLike → model.textPhraseLike.limited → <f>

**<famName>** Contains a family (inherited) name, as opposed to a given, baptismal, or nick name.

<address> → model.addressLike → model.textPhraseLike.limited → model.textPhraseLike → <famName>

**<figDesc>** Contains a brief prose description of the appearance or content of a graphic figure, for use when documenting an image without displaying it.

<address> → model.addressLike → model.textPhraseLike.limited → <figDesc>

**<fing>** finger – An individual finger in a fingering indication.

<address> → model.addressLike → model.textPhraseLike.limited → <fing>

**<foreName>** Contains a forename, given or baptismal name.

<address> → model.addressLike → model.textPhraseLike.limited → model.textPhraseLike → <foreName>

**<funder>** Names of individuals, institutions, or organizations responsible for funding. Funders provide financial support for a project; they are distinct from sponsors, who provide intellectual support and authority.

<address> → model.addressLike → model.textPhraseLike.limited → <funder>

**<genName>** Contains a name component used to distinguish otherwise similar names on the basis of the relative ages or generations of the persons named.

<address> → model.addressLike → model.textPhraseLike.limited → model.textPhraseLike → <genName>

**<genre>** Term or terms that designate a category characterizing a particular style, form, or content.

<address> → model.addressLike → model.textPhraseLike.limited → <genre>

**<geogFeat>** Contains a common noun identifying a geographical feature.

<address> → model.addressLike → model.textPhraseLike.limited → model.textPhraseLike → <geogFeat>

**<geogName>** The proper noun designation for a place, natural feature, or political jurisdiction.

<address> → model.addressLike → model.textPhraseLike.limited → model.textPhraseLike → <geogName>

**<gliss>** A continuous or sliding movement from one pitch to another, usually indicated by a straight or wavy line.

<address> → model.addressLike → model.textPhraseLike.limited → <gliss>

**<hand>** Defines a distinct scribe or handwriting style.

<address> → model.addressLike → model.textPhraseLike.limited → <hand>

**<harm>** An indication of harmony, e.g., chord names, tablature grids, harmonic analysis, figured bass.

<address> → model.addressLike → model.textPhraseLike.limited → <harm>

**<head>** Contains any heading, for example, the title of a section of text, or the heading of a list.

<address> → model.addressLike → model.textPhraseLike.limited → model.textPhraseLike → <head>

**<height>** Description of the vertical size of an object.

<address> → model.addressLike → model.textPhraseLike.limited → <height>

**<identifier>** An alpha-numeric string that establishes the identity of the described material.

<address> → model.addressLike → model.textPhraseLike.limited → model.textPhraseLike → <identifier>

**<imprimatur>** Contains a formal statement authorizing the publication of a work, sometimes required to appear on a title page or its verso.

<address> → model.addressLike → model.textPhraseLike.limited → model.textPhraseLike → model.paracontentPart → <imprimatur>

**<imprint>** Information relating to the publication or distribution of a bibliographic item.

<address> → model.addressLike → model.textPhraseLike.limited → model.textPhraseLike → <imprint>

**<l>** Contains a single line of text within a line group.

<address> → model.addressLike → model.textPhraseLike.limited → model.textPhraseLike → <l>

**<label>** A container for document text that identifies the feature to which it is attached. For a "tool tip" or other generated label, use the label attribute.

<address> → model.addressLike → model.textPhraseLike.limited → <label>

**<labelAbbr>** A label on the pages following the first.

<address> → model.addressLike → model.textPhraseLike.limited → <labelAbbr>

**<language>** Description of a language used in the document.

<address> → model.addressLike → model.textPhraseLike.limited → <language>

**<layoutDesc>** Collects layout descriptions.

<address> → model.addressLike → model.textPhraseLike.limited → <layoutDesc>

**<lem>** (lemma) – Contains the lemma, or base text, of a textual variation.

<address> → model.addressLike → model.textPhraseLike.limited → model.rdgPart.text → model.rdgPart → <lem>

**<li>** Single item in a <list>.

<address> → model.addressLike → model.textPhraseLike.limited → model.textPhraseLike → <li>

**<librettist>** Person or organization who is a writer of the text of an opera, oratorio, etc.

<address> → model.addressLike → model.textPhraseLike.limited → <librettist>

**<line>** A visual line that cannot be represented by a more specific; i.e., semantic, element.

<address> → model.addressLike → model.textPhraseLike.limited → <line>

**<lyricist>** Person or organization who is a writer of the text of a song.

<address> → model.addressLike → model.textPhraseLike.limited → <lyricist>

**<metaMark>** A graphical or textual statement with additional / explanatory information about the musical text. The textual consequences of this intervention are encoded independently via other means; that is, with elements such as <add>, <del>, etc.

<address> → model.addressLike → model.textPhraseLike.limited → <metaMark>

**<name>** Proper noun or noun phrase.

<address> → model.addressLike → model.textPhraseLike.limited → model.textPhraseLike → <name>

**<nameLink>** Contains a connecting phrase or link used within a name but not regarded as part of it, such as "van der" or "of", "from", etc.

<address> → model.addressLike → model.textPhraseLike.limited → model.textPhraseLike → <nameLink>

**<num>** Numeric information in any form.

<address> → model.addressLike → model.textPhraseLike.limited → model.textPhraseLike → <num>

**<octave>** An indication that a passage should be performed one or more octaves above or below its written pitch.

<address> → model.addressLike → model.textPhraseLike.limited → <octave>

**<orig>** Contains material which is marked as following the original, rather than being normalized or corrected.

<address> → model.addressLike → model.textPhraseLike.limited → model.editTransPart.text → model.editTransPart → <orig>

**<ornam>** An element indicating an ornament that is not a mordent, turn, or trill.

<address> → model.addressLike → model.textPhraseLike.limited → <ornam>

**<p>** One or more text phrases that form a logical prose passage.

<address> → model.addressLike → model.textPhraseLike.limited → model.textPhraseLike → model.paracontentPart → <p>

**<perfRes>** Name of an instrument on which a performer plays, a performer's voice range, or a standard performing ensemble designation.

<address> → model.addressLike → model.textPhraseLike.limited → <perfRes>

**<periodName>** A label that describes a period of time, such as 'Baroque' or '3rd Style period'.

<address> → model.addressLike → model.textPhraseLike.limited → model.textPhraseLike → <periodName>

**<persName>** Designation for an individual, including any or all of that individual's forenames, surnames, honorific titles, and added names.

<address> → model.addressLike → model.textPhraseLike.limited → model.textPhraseLike → <persName>

**<pgFoot>** A running footer.

<address> → model.addressLike → model.textPhraseLike.limited → <pgFoot>

**<pgHead>** A running header.

<address> → model.addressLike → model.textPhraseLike.limited → <pgHead>

**<price>** The cost of access to a bibliographic item.

<address> → model.addressLike → model.textPhraseLike.limited → <price>

**<provenance>** The record of ownership or custodianship of an item.

<address> → model.addressLike → model.textPhraseLike.limited → <provenance>

**<pubPlace>** Name of the place where a bibliographic item was published.

<address> → model.addressLike → model.textPhraseLike.limited → <pubPlace>

**<pubStmt>** Container for information regarding the publication or distribution of a bibliographic item, including the publisher's name and address, the date of publication, and other relevant details.

<address> → model.addressLike → model.pubStmtPart → <pubStmt>

**<publisher>** Name of the organization responsible for the publication of a bibliographic item.

<address> → model.addressLike → model.textPhraseLike.limited → <publisher>

**<q>** Contains material which is distinguished from the surrounding phrase-level text using quotation marks or a similar method. Use **<quote>** for block-level quotations.

<address> → model.addressLike → model.textPhraseLike.limited → model.textPhraseLike → <q>

**<quote>** Contains a paragraph-like block of text attributed to an external source, normally set off from the surrounding text by spacing or other typographic distinction.

<address> → model.addressLike → model.textPhraseLike.limited → model.textPhraseLike → model.paraContentPart → <quote>

**<rdg>** (reading) – Contains a single reading within a textual variation.

<address> → model.addressLike → model.textPhraseLike.limited → model.rdgPart.text → model.rdgPart → <rdg>

**<recipient>** The name of the individual(s), institution(s) or organization(s) receiving correspondence.

<address> → model.addressLike → model.textPhraseLike.limited → <recipient>

**<ref>** Defines a traversible reference to another location. May contain text and sub-elements that describe the destination.

<address> → model.addressLike → model.textPhraseLike.limited → model.textPhraseLike → <ref>

**<reg>** Contains material which has been regularized or normalized in some sense.

<address> → model.addressLike → model.textPhraseLike.limited → model.editTransPart.text → model.editTransPart → <reg>

**<region>** Contains the name of an administrative unit such as a state, province, or county, larger than a settlement, but smaller than a country.

<address> → model.addressLike → model.textPhraseLike.limited → model.textPhraseLike → <region>

**<rend>** A formatting element indicating special visual rendering, e.g., bold or italicized, of a text word or phrase.

<address> → model.addressLike → model.textPhraseLike.limited → model.textPhraseLike → <rend>

**<repeatMark>** An instruction expressed as a combination of text and symbols – segno and coda – typically above, below, or between staves, but not on the staff.

<address> → model.addressLike → model.textPhraseLike.limited → <repeatMark>

**<repository>** Institution, agency, or individual which holds a bibliographic item.

<address> → model.addressLike → model.textPhraseLike.limited → <repository>

**<resp>** A phrase describing the nature of intellectual responsibility.

<address> → model.addressLike → model.textPhraseLike.limited → <resp>

**<restore>** Indicates restoration of material to an earlier state by cancellation of an editorial or authorial marking or instruction.

<address> → model.addressLike → model.textPhraseLike.limited → model.editTransPart.text → model.editTransPart → <restore>

**<role>** Name of a dramatic role, as given in a cast list.

<address> → model.addressLike → model.textPhraseLike.limited → <role>

**<roleDesc>** Describes a character's role in a drama.

<address> → model.addressLike → model.textPhraseLike.limited → <roleDesc>

**<roleName>** Contains a name component which indicates that the referent has a particular role or position in society, such as an official title or rank.

<address> → model.addressLike → model.textPhraseLike.limited → model.textPhraseLike → <roleName>

**<scriptDesc>** Contains a description of the letters or characters used in an autographic item.

<address> → model.addressLike → model.textPhraseLike.limited → <scriptDesc>

**<seal>** A single seal or similar attachment.

<address> → model.addressLike → model.textPhraseLike.limited → <seal>

**<sealDesc>** Describes the seals or similar external attachments applied to an item.

<address> → model.addressLike → model.textPhraseLike.limited → <sealDesc>

**<seg>** (arbitrary segment) represents any segmentation of text below the "text component" level.

<address> → model.addressLike → model.textPhraseLike.limited → model.textPhraseLike → <seg>

**<settlement>** Contains the name of a settlement such as a city, town, or village identified as a single geopolitical or administrative unit.

<address> → model.addressLike → model.textPhraseLike.limited → model.textPhraseLike → <settlement>

**<sic>** Contains apparently incorrect or inaccurate material.

<address> → model.addressLike → model.textPhraseLike.limited → model.editTransPart.text → model.editTransPart → <sic>

**<signifLet>** Significantive letter(s).

<address> → model.addressLike → model.textPhraseLike.limited → <signifLet>

**<soundChan>** Reflects the number of apparent sound channels in the playback of a recording (monaural, stereophonic, quadraphonic, etc.).

<address> → model.addressLike → model.textPhraseLike.limited → <soundChan>

**<speaker>** Contains a specialized form of heading or label, giving the name of one or more speakers in a dramatic text or fragment.

<address> → model.addressLike → model.textPhraseLike.limited → <speaker>

**<sponsor>** Names of sponsoring individuals, organizations or institutions. Sponsors give their intellectual authority to a project; they are to be distinguished from funders, who provide the funding but do not necessarily take intellectual responsibility.

<address> → model.addressLike → model.textPhraseLike.limited → <sponsor>

**<stack>** An inline table with a single column.

<address> → model.addressLike → model.textPhraseLike.limited → <stack>

**<stageDir>** Contains any kind of stage direction within a dramatic text or fragment.

<address> → model.addressLike → model.textPhraseLike.limited → <stageDir>

**<street>** full street address including any name or number identifying a building as well as the name of the street or route on which it is located.

<address> → model.addressLike → model.textPhraseLike.limited → model.textPhraseLike → <street>

**<styleName>** A label for a characteristic style of writing or performance, such as 'bebop' or 'rock-n-roll'.

<address> → model.addressLike → model.textPhraseLike.limited → model.textPhraseLike → <styleName>

**<supplied>** Contains material supplied by the transcriber or editor for any reason.

<address> → model.addressLike → model.textPhraseLike.limited → model.editTransPart.text → model.editTransPart → <supplied>

**<supportDesc>** Groups elements describing the physical support material of an item.

<address> → model.addressLike → model.textPhraseLike.limited → <supportDesc>

**<syl>** Individual lyric syllable.

<address> → model.addressLike → model.textPhraseLike.limited → <syl>

**<td>** Designates a table cell that contains data as opposed to a cell that contains column or row heading information.

<address> → model.addressLike → model.textPhraseLike.limited → model.textPhraseLike → <td>

**<tempo>** Text and symbols descriptive of tempo, mood, or style, e.g., "allarg.", "a tempo", "cantabile", "Moderato", "J=60", "Moderato J =60").

<address> → model.addressLike → model.textPhraseLike.limited → <tempo>

**<term>** Keyword or phrase which describes a resource.

<address> → model.addressLike → model.textPhraseLike.limited → <term>

**<textLang>** Identifies the languages and writing systems within the work described by a bibliographic description, not the language of the description.

<address> → model.addressLike → model.textPhraseLike.limited → <textLang>

**<th>** Designates a table cell containing column or row heading information as opposed to one containing data.

<address> → model.addressLike → model.textPhraseLike.limited → model.textPhraseLike → <th>

**<treatHist>** A record of the treatment the item has undergone (e.g., de-acidification, restoration, etc.).

<address> → model.addressLike → model.textPhraseLike.limited → <treatHist>

**<treatSched>** Scheduled treatment, e.g., de-acidification, restoration, etc., for an item.

<address> → model.addressLike → model.textPhraseLike.limited → <treatSched>

**<typeDesc>** Contains a description of the typefaces or other aspects of the printing of a printed source.

<address> → model.addressLike → model.textPhraseLike.limited → <typeDesc>

**<unclear>** Contains material that cannot be transcribed with certainty because it is illegible or inaudible in the source.

<address> → model.addressLike → model.textPhraseLike.limited → model.editTransPart.text → model.editTransPart → <unclear>

**<width>** Description of the horizontal size of an object.

<address> → model.addressLike → model.textPhraseLike.limited → <width>

## May Contain

**<addrLine>** Single line of a postal address.

<address> → direct children → <addrLine>

**<bloc>** Contains the name of a geopolitical unit consisting of two or more nation states or countries.

<address> → model.addressPart → model.geogNamePart → <bloc>

**<country>** Contains the name of a geopolitical unit, such as a nation, country, colony, or commonwealth, larger than or administratively superior to a region and smaller than a bloc.

<address> → model.addressPart → model.geogNamePart → <country>

**<district>** Contains the name of any kind of subdivision of a settlement, such as a parish, ward, or other administrative or geographic unit.

<address> → model.addressPart → model.geogNamePart → <district>

**<geogFeat>** Contains a common noun identifying a geographical feature.

<address> → model.addressPart → model.geogNamePart → <geogFeat>

**<postBox>** (postal box or post office box) contains a number or other identifier for some postal delivery point other than a street address.

<address> → model.addressPart → <postBox>

**<postCode>** (postal code) contains a numerical or alphanumeric code used as part of a postal address to simplify sorting or delivery of mail.

<address> → model.addressPart → <postCode>

**<region>** Contains the name of an administrative unit such as a state, province, or county, larger than a settlement, but smaller than a country.

<address> → model.addressPart → model.geogNamePart → <region>

**<settlement>** Contains the name of a settlement such as a city, town, or village identified as a single geopolitical or administrative unit.

<address> → model.addressPart → model.geogNamePart → <settlement>

**<street>** full street address including any name or number identifying a building as well as the name of the street or route on which it is located.

<address> → model.addressPart → <street>

## Remarks

The model of this element is based on the [address](#) element of the Text Encoding Initiative (TEI) and the [address](#) element of the Encoded Archival Description (EAD).

## Declaration

```

DEVELOPMENT  
VERSION

## <altId>

(alternative identifier) – May contain a bibliographic identifier that does not fit within the meiHead element's id attribute, for example because the identifier does not fit the definition of an XML id or because multiple identifiers are needed.

### Referenced in chapters

[3.2 Structure of the MEI Header](#), [3.4.1.5 Notes Statement](#)

### Module

[MEI.header](#)

### Attributes

**@analog** (*optional*) Contains a reference to a field or element in another descriptive encoding system to which this MEI element is comparable. Value is plain text.

<altId> → [att.bibl](#) → @analog

**@class** (*optional*) Contains one or more URIs which denote classification terms that apply to the entity bearing this attribute. One or more values from [data.URI](#), separated by spaces.

<altId> → [att.common](#) → [att.typed](#) → [att.classed](#) → @class

**@copyof** (*optional*) Points to an element of which the current element is a copy. Value conforms to [data.URI](#).

<altId> → [att.common](#) → [att.linkin](#) → @copyof

**@corresp** (*optional*) Used to point to other elements that correspond to this one in a generic fashion. One or more values from [data.URI](#), separated by spaces.

<altId> → [att.common](#) → [att.linkin](#) → @corresp

**@follows** (*optional*) points to one or more events in a user-defined collection that are known to be predecessors of the current element. One or more values from [data.URI](#), separated by spaces.

<altId> → [att.common](#) → [att.linkin](#) → @follows

**@label** (*optional*) Captures text to be used to generate a label for the element to which it's attached, a "tool tip" or prefatory text, for example. Should not be used to record document content. Value is plain text.

<altId> → [att.common](#) → [att.labelled](#) → @label

**@n** (*optional*) Provides a number-like designation that indicates an element's position in a sequence of similar elements. May not contain space characters. Value conforms to [data.WORD](#).

<altId> → [att.common](#) → [att.nNumberLike](#) → @n

**@next** (*optional*) Used to point to the next event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<altId> → [att.common](#) → [att.linkin](#) → @next

**@precedes** (*optional*) Points to one or more events in a user-defined collection that are known to be successors of the current element. One or more values from [data.URI](#), separated by spaces.

<altId> → [att.common](#) → [att.linkin](#) → @precedes

**@prev** (*optional*) Points to the previous event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<altId> → att.common → att.linked → @prev

**@resp** (*optional*) Indicates the agent(s) responsible for some aspect of the text's transcription, editing, or encoding. Its value must point to one or more identifiers declared in the document header. One or more values from [data.URI](#), separated by spaces.

<altId> → att.common → att.responsibility → @resp

**@sameas** (*optional*) Points to an element that is the same as the current element but is not a literal copy of the current element. One or more values from [data.URI](#), separated by spaces.

<altId> → att.common → att.linked → @sameas

**@synch** (*optional*) Points to elements that are synchronous with the current element. One or more values from [data.URI](#), separated by spaces.

<altId> → att.common → att.linked → @synch

**@type** (*optional*) Designation which characterizes the element in some sense, using any convenient classification scheme or typology that employs single-token labels. One or more values of datatype **NMTOKEN**, separated by spaces.

<altId> → att.common → att.type → @type

**@xml:base** (*optional*) Provides a base URI reference with which applications can resolve relative URI references into absolute URI references. Value conforms to [data.URI](#).

<altId> → att.common → att.basic → @xml:base

**@xml:id** (*optional*) Regularizes the naming of an element and thus facilitates building links between it and other resources. Each id attribute within a document must have a unique value. Value is a valid [xml:id](#).

<altId> → att.common → att.basic → att.id → @xml:id

## Member of

(altId isn't member of any model class)

## Contained By

**<category>** Contains an individual descriptive category in a user-defined taxonomy, possibly nested within a superordinate category.

<altId> → elements having altId as direct children → <category>

**<meiHead>** Supplies the descriptive and declarative metadata prefixed to every MEI-conformant text.

<altId> → elements having altId as direct children → <meiHead>

## May Contain

**<lb>** An empty formatting element that forces text to begin on a new line.

<altId> → model.lbLike → <lb>

**<rend>** A formatting element indicating special visual rendering, e.g., bold or italicized, of a text word or phrase.

<altId> → model.rendLike → <rend>

**<stack>** An inline table with a single column.

<altId> → model.rendLike → <stack>

## Remarks

One or the other of <`altId`> or the `xml:id` attribute on <`mei`> is required when applicable.

## Declaration

```
<elementSpec ident="altId" module="MEI.header">
  <gloss versionDate="2022-05-18" xml:lang="en">alternative identifier</gloss>
  <desc xml:lang="en">May contain a bibliographic identifier that does not fit within the

</elementSpec>
```

## <ambNote>

Highest or lowest pitch in a score, staff, or layer.

### Module

MEI.shared

### Attributes

**@accid** (*optional*) Captures a written accidental. Value conforms to [data.ACIDENTAL.WRITTEN](#).

<ambNote> → att.ambNote.log → att.accidental → @accid

**@class** (*optional*) Contains one or more URIs which denote classification terms that apply to the entity bearing this attribute. One or more values from [data.URI](#), separated by spaces.

<ambNote> → att.common → att.typed → att.classed → @class

**@color** (*optional*) Used to indicate visual appearance. Do not confuse this with the musical term 'color' as used in pre-CMN notation. Value conforms to [data.COLOR](#).

<ambNote> → att.ambNote.vis → att.color → @color

**@colored** (*optional*) Indicates this feature is 'colored'; that is, it is a participant in a change in rhythmic values. In mensural notation, coloration is indicated by colored notes (red, black, etc.) where void notes would otherwise occur. In CMN, coloration is indicated by an inverse color; that is, the note head is void when it would otherwise be filled and vice versa. Value conforms to [data.BOOLEAN](#).

<ambNote> → att.ambNote.log → att.coloration → @colored

**@copyof** (*optional*) Points to an element of which the current element is a copy. Value conforms to [data.URI](#).

<ambNote> → att.common → att.linkng → @copyof

**@corresp** (*optional*) Used to point to other elements that correspond to this one in a generic fashion. One or more values from [data.URI](#), separated by spaces.

<ambNote> → att.common → att.linkng → @corresp

**@dur** (*optional*) Records the duration of a feature using the relative durational values provided by the [data.DURATION](#) datatype. Value conforms to [data.DURATION](#).

<ambNote> → att.ambNote.log → att.duration.log → @dur

**@enclose** (*optional*) Records the characters often used to mark accidentals, articulations, and sometimes notes as having a cautionary or editorial function. For an example of cautionary accidentals enclosed in parentheses, see Read, p. 131, ex. 9-14. Value conforms to [data.ENCLOSURE](#).

<ambNote> → att.ambNote.vis → att.enclosingChars → @enclose

**@facs** (*optional*) Points to one or more images, portions of an image, or surfaces which correspond to the current element. One or more values from [data.URI](#), separated by spaces.

<ambNote> → att.facsimile → @facs

**@follows** (*optional*) points to one or more events in a user-defined collection that are known to be predecessors of the current element. One or more values from [data.URI](#), separated by spaces.

<ambNote> → att.common → att.linkng → @follows

**@fontfam** (*optional*) Contains the name of a font-family. Value conforms to [data.FONTFAMILY](#).

<ambNote> → att.ambNote.vis → att.typography → @fontfam

**@fontname** (*optional*) Holds the name of a font. Value conforms to [data.FONTNAME](#).

<ambNote> → att.ambNote.vis → att.typography → @fontname

**@fontsize** (*optional*) Indicates the size of a font expressed in printers' points, i.e., 1/72nd of an inch, relative terms, e.g., small, larger, etc., or percentage values relative to normal size, e.g., 125%. Value conforms to [data.FONTSIZE](#).

<ambNote> → att.ambNote.vis → att.typography → @fontsize

**@fontstyle** (*optional*) Records the style of a font, i.e., italic, oblique, or normal. Value conforms to [data.FONTSTYLE](#).

<ambNote> → att.ambNote.vis → att.typography → @fontstyle

**@fontweight** (*optional*) Used to indicate bold type. Value conforms to [data.FONTWEIGHT](#).

<ambNote> → att.ambNote.vis → att.typography → @fontweight

**@head.altsym** (*optional*) Provides a way of pointing to a user-defined symbol. It must contain a reference to an ID of a [<symbolDef>](#) element elsewhere in the document. Value conforms to [data.URI](#).

<ambNote> → att.ambNote.vis → att.noteHeads → @head.altsym

**@head.auth** (*optional*) A name or label associated with the controlled vocabulary from which a numerical value of head.shape is taken. Allowed values are: "**smufl**" (*Standard Music Font Layout*.)

<ambNote> → att.ambNote.vis → att.noteHeads → @head.auth

**@head.color** (*optional*) Captures the overall color of a notehead. Value conforms to [data.COLOR](#).

<ambNote> → att.ambNote.vis → att.noteHeads → @head.color

**@head.fill** (*optional*) Describes how/if the notehead is filled. Value conforms to [data.FILL](#).

<ambNote> → att.ambNote.vis → att.noteHeads → @head.fill

**@head.fillcolor** (*optional*) Captures the fill color of a notehead if different from the overall note color. Value conforms to [data.COLOR](#).

<ambNote> → att.ambNote.vis → att.noteHeads → @head.fillcolor

**@head.mod** (*optional*) Records any additional symbols applied to the notehead. One or more values from [data.NOTEHEADMODIFIER](#), separated by spaces.

<ambNote> → att.ambNote.vis → att.noteHeads → @head.mod

**@head.rotation** (*optional*) Describes rotation applied to the basic notehead shape. A positive value rotates the notehead in a counter-clockwise fashion, while negative values produce clockwise rotation. Value conforms to [data.ROTATION](#).

<ambNote> → att.ambNote.vis → att.noteHeads → @head.rotation

**@head.shape** (*optional*) Used to override the head shape normally used for the given duration. Value conforms to [data.HEADSHAPE](#).

<ambNote> → att.ambNote.vis → att.noteHeads → @head.shape

**@head.visible** (*optional*) Indicates if a feature should be rendered when the notation is presented graphically or sounded when it is presented in an aural form. Value conforms to [data.BOOLEAN](#).

<ambNote> → att.ambNote.vis → att.noteHeads → @head.visible

**@label** (*optional*) Captures text to be used to generate a label for the element to which it's attached, a "tool tip" or prefatory text, for example. Should not be used to record document content. Value is plain text.

<ambNote> → att.common → att.labelled → @label

**@letterspacing** (*optional*) Indicates letter spacing (aka tracking) in analogy to the CSS letter-spacing property. Value conforms to [data.MEASUREMENTTYPOGRAPHYSIGNED](#).

<ambNote> → att.ambNote.vis → att.typography → @letterspacing

**@lineheight** (*optional*) Indicates line height in analogy to the CSS line-height property. Value conforms to either [data.MEASUREMENTTYPOGRAPHYUNSIGNED](#) or [data.PERCENT](#).

<ambNote> → att.ambNote.vis → att.typography → @lineheight

**@loc** (*optional*) Holds the staff location of the feature. Value conforms to [data.STAFFLOC](#).

<ambNote> → att.ambNote.vis → att.staffLoc → @loc

**@n** (*optional*) Provides a number-like designation that indicates an element's position in a sequence of similar elements. May not contain space characters. Value conforms to [data.WORD](#).

<ambNote> → att.common → att.nNumberLike → @n

**@next** (*optional*) Used to point to the next event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<ambNote> → att.common → att.linked → @next

**@oct** (*optional*) Captures written octave information. Value conforms to [data.OCTAVE](#).

<ambNote> → att.ambNote.log → att.pitched → att.octave → @oct

**@pname** (*optional*) Contains a written pitch name. Value conforms to [data.PITCHNAME](#).

<ambNote> → att.ambNote.log → att.pitched → att.pitch → @pname

**@precedes** (*optional*) Points to one or more events in a user-defined collection that are known to be successors of the current element. One or more values from [data.URI](#), separated by spaces.

<ambNote> → att.common → att.linked → @precedes

**@prev** (*optional*) Points to the previous event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<ambNote> → att.common → att.linked → @prev

**@resp** (*optional*) Indicates the agent(s) responsible for some aspect of the text's transcription, editing, or encoding. Its value must point to one or more identifiers declared in the document header. One or more values from [data.URI](#), separated by spaces.

<ambNote> → att.common → att.responsibility → @resp

**@sameas** (*optional*) Points to an element that is the same as the current element but is not a literal copy of the current element. One or more values from [data.URI](#), separated by spaces.

<ambNote> → att.common → att.linked → @sameas

**@stem.dir** (*optional*) Describes the direction of a stem. Value conforms to [data.STEMDIRECTION](#).

<ambNote> → att.ambNote.vis → att.stems → @stem.dir

**@stem.form** (*optional*) Records the form of the stem. Value conforms to [data.STEMFORM.mensural](#).

<ambNote> → att.ambNote.vis → att.stems → att.stems.mensural → @stem.form

**@stem.len** (*optional*) Encodes the stem length. Value conforms to [data.MEASUREMENTUNSIGNED](#).

<ambNote> → att.ambNote.vis → att.stems → @stem.len

**@stem.mod** (*optional*) Encodes any stem "modifiers"; that is, symbols rendered on the stem, such as tremolo or Sprechstimme indicators. Value conforms to [data.STEMMODIFIER](#).

<ambNote> → att.ambNote.vis → att.stems → @stem.mod

**@stem.pos** (*optional*) Records the position of the stem in relation to the note head(s). Value conforms to [data.STEMPOSITION](#).

<ambNote> → att.ambNote.vis → att.stems → @stem.pos

**@stem.sameas** (*optional*) Points to a note element in a different layer whose stem is shared. The linked notes should be rendered like a chord though they are part of different layers. Value conforms to [data.URI](#).

<ambNote> → att.ambNote.vis → att.stems → @stem.sameas

**@stem.visible** (*optional*) Determines whether a stem should be displayed. Value conforms to [data.BOOLEAN](#).

<ambNote> → att.ambNote.vis → att.stems → @stem.visible

**@stem.with** (*optional*) Contains an indication of which staff a note or chord that logically belongs to the current staff should be visually placed on; that is, the one above or the one below. Value conforms to [data.NEIGHBORINGLAYER](#).

<ambNote> → att.ambNote.vis → att.stems → att.stems.cmn → @stem.with

**@stem.x** (*optional*) Records the output x coordinate of the stem's attachment point. Value is a decimal number.

<ambNote> → att.ambNote.vis → att.stems → @stem.x

**@stem.y** (*optional*) Records the output y coordinate of the stem's attachment point. Value is a decimal number.

<ambNote> → att.ambNote.vis → att.stems → @stem.y

**@synch** (*optional*) Points to elements that are synchronous with the current element. One or more values from [data.URI](#), separated by spaces.

<ambNote> → att.common → att.linking → @synch

**@type** (*optional*) Designation which characterizes the element in some sense, using any convenient classification scheme or typology that employs single-token labels. One or more values of datatype **NMTOKEN**, separated by spaces.

<ambNote> → att.common → att.typed → @type

**@xml:base** (*optional*) Provides a base URI reference with which applications can resolve relative URI references into absolute URI references. Value conforms to [data.URI](#).

<ambNote> → att.common → att.basic → @xml:base

**@xml:id** (*optional*) Regularizes the naming of an element and thus facilitates building links between it and other resources. Each id attribute within a document must have a unique value. Value is a valid [xml:id](#).

<ambNote> → att.common → att.basic → att.id → @xml:id

## Member of

## <ambitus>

Range of a voice, instrument or piece.

### Module

[MEI.shared](#)

### Attributes

**@class** (*optional*) Contains one or more URIs which denote classification terms that apply to the entity bearing this attribute. One or more values from [data.URI](#), separated by spaces.

<ambitus> → [att.common](#) → [att.typed](#) → [att.classed](#) → @class

**@copyof** (*optional*) Points to an element of which the current element is a copy. Value conforms to [data.URI](#).

<ambitus> → [att.common](#) → [att.linked](#) → @copyof

**@corresp** (*optional*) Used to point to other elements that correspond to this one in a generic fashion. One or more values from [data.URI](#), separated by spaces.

<ambitus> → [att.common](#) → [att.linked](#) → @corresp

**@decls** (*optional*) Identifies one or more metadata elements (other than classification terms) within the header, which are understood to apply to the element bearing this attribute and its content. One or more values from [data.URI](#), separated by spaces.

<ambitus> → [att.metadataPointing](#) → @decls

**@facs** (*optional*) Points to one or more images, portions of an image, or surfaces which correspond to the current element. One or more values from [data.URI](#), separated by spaces.

<ambitus> → [att.facsimile](#) → @facs

**@follows** (*optional*) points to one or more events in a user-defined collection that are known to be predecessors of the current element. One or more values from [data.URI](#), separated by spaces.

<ambitus> → [att.common](#) → [att.linked](#) → @follows

**@inth** (*optional*) Encodes the harmonic interval between pitches occurring at the same time. One or more values from [data.INTERVAL.HARMONIC](#), separated by spaces.

<ambitus> → [att.ambitus.anl](#) → [att.intervalHarmonic](#) → @inth

**@label** (*optional*) Captures text to be used to generate a label for the element to which it's attached, a "tool tip" or prefatory text, for example. Should not be used to record document content. Value is plain text.

<ambitus> → [att.common](#) → [att.labelled](#) → @label

**@n** (*optional*) Provides a number-like designation that indicates an element's position in a sequence of similar elements. May not contain space characters. Value conforms to [data.WORD](#).

<ambitus> → [att.common](#) → [att.nNumberLike](#) → @n

**@next** (*optional*) Used to point to the next event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<ambitus> → [att.common](#) → [att.linked](#) → @next

**@precedes** (*optional*) Points to one or more events in a user-defined collection that are known to be successors of the current element. One or more values from [data.URI](#), separated by spaces.

<ambitus> → [att.common](#) → [att.linked](#) → @precedes

**@prev** (*optional*) Points to the previous event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<ambitus> → [att.common](#) → [att.linking](#) → @prev

**@resp** (*optional*) Indicates the agent(s) responsible for some aspect of the text's transcription, editing, or encoding. Its value must point to one or more identifiers declared in the document header. One or more values from [data.URI](#), separated by spaces.

<ambitus> → [att.common](#) → [att.responsibility](#) → @resp

**@sameas** (*optional*) Points to an element that is the same as the current element but is not a literal copy of the current element. One or more values from [data.URI](#), separated by spaces.

<ambitus> → [att.common](#) → [att.linking](#) → @sameas

**@synch** (*optional*) Points to elements that are synchronous with the current element. One or more values from [data.URI](#), separated by spaces.

<ambitus> → [att.common](#) → [att.linking](#) → @synch

**@type** (*optional*) Designation which characterizes the element in some sense, using any convenient classification scheme or typology that employs single-token labels. One or more values of datatype **NMTOKEN**, separated by spaces.

<ambitus> → [att.common](#) → [att.typed](#) → @type

**@xml:base** (*optional*) Provides a base URI reference with which applications can resolve relative URI references into absolute URI references. Value conforms to [data.URI](#).

<ambitus> → [att.common](#) → [att.basic](#) → @xml:base

**@xml:id** (*optional*) Regularizes the naming of an element and thus facilitates building links between it and other resources. Each id attribute within a document must have a unique value. Value is a valid [xml:id](#).

<ambitus> → [att.common](#) → [att.basic](#) → [att.id](#) → @xml:id

## Member of

## <analytic>

(analytic level) – Contains bibliographic elements describing an item (e.g., an article or poem) published within a monograph or journal and not as an independent publication.

### Referenced in chapters

[3.3.2 Responsibility Attribution](#)

### Module

[MEI.shared](#)

### Attributes

**@analog** (*optional*) Contains a reference to a field or element in another descriptive encoding system to which this MEI element is comparable. Value is plain text.

<analytic> → [att.bibl](#) → @analog

**@class** (*optional*) Contains one or more URIs which denote classification terms that apply to the entity bearing this attribute. One or more values from [data.URI](#), separated by spaces.

<analytic> → [att.common](#) → [att.typed](#) → [att.classed](#) → @class

**@comptype** (*optional*) Allowed values are: "**constituent**" (*A physical and logical part of entity.*), "**boundwith**" (*A physical, but not logical component of the entity, usually included as part of the binding process.*), "**separated**" (*A logical component of the entity physically held elsewhere.*)

<analytic> → [att.componentType](#) → @comptype

**@copyof** (*optional*) Points to an element of which the current element is a copy. Value conforms to [data.URI](#).

<analytic> → [att.common](#) → [att.linkin](#) → @copyof

**@corresp** (*optional*) Used to point to other elements that correspond to this one in a generic fashion. One or more values from [data.URI](#), separated by spaces.

<analytic> → [att.common](#) → [att.linkin](#) → @corresp

**@data** (*optional*) Used to link metadata elements to one or more data-containing elements. One or more values from [data.URI](#), separated by spaces.

<analytic> → [att.dataPointing](#) → @data

**@evaluate** (*optional*) Specifies the intended meaning when a participant in a relationship is itself a pointer. Allowed values are: "**all**" (*If an element pointed to is itself a pointer, then the target of that pointer will be taken, and so on, until an element is found which is not a pointer.*), "**one**" (*If an element pointed to is itself a pointer, then its target (whether a pointer or not) is taken as the target of this pointer.*), "**none**" (*No further evaluation of targets is carried out beyond that needed to find the element(s) specified in plist or target attribute.*)

<analytic> → [att.targetEval](#) → @evaluate

**@follows** (*optional*) points to one or more events in a user-defined collection that are known to be predecessors of the current element. One or more values from [data.URI](#), separated by spaces.

<analytic> → [att.common](#) → [att.linkin](#) → @follows

**@label** (*optional*) Captures text to be used to generate a label for the element to which it's attached, a "tool tip" or prefatory text, for example. Should not be used to record document content. Value is plain text.

<analytic> → att.common → att.labelled → @label

**@on** (*optional*) Provides a number-like designation that indicates an element's position in a sequence of similar elements. May not contain space characters. Value conforms to [data.WORD](#).

<analytic> → att.common → att.nNumberLike → @n

**@next** (*optional*) Used to point to the next event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<analytic> → att.common → att.linked → @next

**@precedes** (*optional*) Points to one or more events in a user-defined collection that are known to be successors of the current element. One or more values from [data.URI](#), separated by spaces.

<analytic> → att.common → att.linked → @precedes

**@prev** (*optional*) Points to the previous event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<analytic> → att.common → att.linked → @prev

**@recordtype** Allowed values are: "a" (*Language material.*), "c" (*Notated music.*), "d" (*Manuscript notated music.*), "e" (*Non-manuscript cartographic material.*), "f" (*Manuscript cartographic material.*), "g" (*Projected medium.*), "i" (*Nonmusical sound recording.*), "j" (*Musical sound recording.*), "k" (*Two-dimensional nonprojectable graphic.*), "m" (*Computer file.*), "o" (*Kit.*), "p" (*Mixed materials.*), "r" (*Three-dimensional artifact or naturally occurring object.*), "t" (*Manuscript language material.*.)

<analytic> → att.recordType → @recordtype

**@resp** (*optional*) Indicates the agent(s) responsible for some aspect of the text's transcription, editing, or encoding. Its value must point to one or more identifiers declared in the document header. One or more values from [data.URI](#), separated by spaces.

<analytic> → att.common → att.responsibility → @resp

**@sameas** (*optional*) Points to an element that is the same as the current element but is not a literal copy of the current element. One or more values from [data.URI](#), separated by spaces.

<analytic> → att.common → att.linked → @sameas

**@synch** (*optional*) Points to elements that are synchronous with the current element. One or more values from [data.URI](#), separated by spaces.

<analytic> → att.common → att.linked → @synch

**@target** (*optional*) Identifies passive participants in a relationship; that is, the entities pointed "to". One or more values from [data.URI](#), separated by spaces.

<analytic> → att.pointing → @target

**@targettype** (*optional*) Characterization of target resource(s) using any convenient classification scheme or typology. Value is a [NMOKEN](#).

<analytic> → att.pointing → @targettype

**@type** (*optional*) Designation which characterizes the element in some sense, using any convenient classification scheme or typology that employs single-token labels. One or more values of datatype

[NMOKEN](#), separated by spaces.

<analytic> → att.common → att.typed → @type

**@xlink:actuate** (*optional*) Defines whether a link occurs automatically or must be requested by the user. Allowed values are: "onLoad" (*Load the target resource(s) immediately.*), "onRequest" (*Load the target resource(s) upon user request.*), "none" (*Do not permit loading of the target resource(s).*), "other" (*Behavior other than allowed by the other values of this attribute.*)

<analytic> → att.pointing → @xlink:actuate

**@xlink:role** (*optional*) Characterization of the relationship between resources. The value of the role attribute must be a URI. Value conforms to [data.URI](#).

<analytic> → att.pointing → @xlink:role

**@xlink:show** (*optional*) Defines how a remote resource is rendered. Allowed values are: "new" (*Open in a new window.*), "replace" (*Load the referenced resource in the same window.*), "embed" (*Embed the referenced resource at the point of the link.*), "none" (*Do not permit traversal to the referenced resource.*), "other" (*Behavior other than permitted by the other values of this attribute.*)

<analytic> → att.pointing → @xlink:show

**@xml:base** (*optional*) Provides a base URI reference with which applications can resolve relative URI references into absolute URI references. Value conforms to [data.URI](#).

<analytic> → att.common → att.basic → @xml:base

**@xml:id** (*optional*) Regularizes the naming of an element and thus facilitates building links between it and other resources. Each id attribute within a document must have a unique value. Value is a valid [xml:id](#).

<analytic> → att.common → att.basic → att.id → @xml:id

## Member of

(analytic isn't member of any model class)

## Contained By

**<biblStruct>** Contains a bibliographic citation in which bibliographic sub-elements must appear in a specified order.

<analytic> → elements having analytic as direct children → <biblStruct>

## May Contain

**<arranger>** A person or organization who transcribes a musical composition, usually for a different medium from that of the original; in an arrangement the musical substance remains essentially unchanged.

<analytic> → model.respLikePart → <arranger>

**<author>** The name of the creator of the intellectual content of a non-musical, literary work.

<analytic> → model.respLikePart → <author>

**<biblScope>** Defines the scope of a bibliographic reference, for example as a list of page numbers, or a named subdivision of a larger work.

<analytic> → direct children → <biblScope>

**<composer>** The name of the creator of the intellectual content of a musical work.

<analytic> → model.respLikePart → <composer>

**<contributor>** Names of individuals, institutions, or organizations responsible for contributions to the intellectual content of a work, where the specialized elements for authors, editors, etc. do not suffice or do not apply.

<analytic> → model.respLikePart → <contributor>

**<editor>** The name of the individual(s), institution(s) or organization(s) acting in an editorial capacity.

<analytic> → model.respLikePart → <editor>

**<funder>** Names of individuals, institutions, or organizations responsible for funding. Funders provide financial support for a project; they are distinct from sponsors, who provide intellectual support and authority.

<analytic> → model.respLikePart → <funder>

**<identifier>** An alpha-numeric string that establishes the identity of the described material.

<analytic> → direct children → <identifier>

**<librettist>** Person or organization who is a writer of the text of an opera, oratorio, etc.

<analytic> → model.respLikePart → <librettist>

**<lyricist>** Person or organization who is a writer of the text of a song.

<analytic> → model.respLikePart → <lyricist>

**<respStmt>** Transcription of text that names one or more individuals, groups, or in rare cases, mechanical processes, responsible for creation, realization, production, funding, or distribution of the intellectual or artistic content.

<analytic> → direct children → <respStmt>

**<sponsor>** Names of sponsoring individuals, organizations or institutions. Sponsors give their intellectual authority to a project; they are to be distinguished from funders, who provide the funding but do not necessarily take intellectual responsibility.

<analytic> → model.respLikePart → <sponsor>

**<title>** Title of a bibliographic entity.

<analytic> → direct children → <title>

## <anchoredText>

Container for text that is fixed to a particular page location, regardless of changes made to the layout of the measures around it.

### Referenced in chapters

[2.4.1.1 Elements](#), [2.4.2 Uses of the Usersymbols Module](#), [2.4.2.2 Elements Without Semantic Implications](#)

### Module

[MEI.usersymbols](#)

### Attributes

**@class** (*optional*) Contains one or more URIs which denote classification terms that apply to the entity bearing this attribute. One or more values from [data.URI](#), separated by spaces.

<anchoredText> → att.common → att.typed → att.classed → @class

**@copyof** (*optional*) Points to an element of which the current element is a copy. Value conforms to [data.URI](#).

<anchoredText> → att.common → att.linked → @copyof

**@corresp** (*optional*) Used to point to other elements that correspond to this one in a generic fashion. One or more values from [data.URI](#), separated by spaces.

<anchoredText> → att.common → att.linked → @corresp

**@facs** (*optional*) Points to one or more images, portions of an image, or surfaces which correspond to the current element. One or more values from [data.URI](#), separated by spaces.

<anchoredText> → att.facsimile → @facs

**@follows** (*optional*) points to one or more events in a user-defined collection that are known to be predecessors of the current element. One or more values from [data.URI](#), separated by spaces.

<anchoredText> → att.common → att.linked → @follows

**@func** (*recommended*) Indicates the function of the text. Allowed values are: "unknown" (*The function of the text is unknown.*)

<anchoredText> → att.anchoredText.log → @func

**@ho** (*optional*) Records a horizontal adjustment to a feature's programmatically-determined location in terms of staff interline distance; that is, in units of 1/2 the distance between adjacent staff lines. Value conforms to [data.MEASUREMENTSIGNED](#).

<anchoredText> → att.anchoredText.vis → att.visualOffset → att.visualOffset.ho → @ho

**@label** (*optional*) Captures text to be used to generate a label for the element to which it's attached, a "tool tip" or prefatory text, for example. Should not be used to record document content. Value is plain text.

<anchoredText> → att.common → att.labelled → @label

**@n** (*optional*) Provides a number-like designation that indicates an element's position in a sequence of similar elements. May not contain space characters. Value conforms to [data.WORD](#).

<anchoredText> → att.common → att.nNumberLike → @n

**@next** (*optional*) Used to point to the next event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<anchoredText> → att.common → att.linked → @next

**@precedes** (*optional*) Points to one or more events in a user-defined collection that are known to be successors of the current element. One or more values from [data.URI](#), separated by spaces.

<anchoredText> → att.common → att.linked → @precedes

**@prev** (*optional*) Points to the previous event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<anchoredText> → att.common → att.linked → @prev

**@resp** (*optional*) Indicates the agent(s) responsible for some aspect of the text's transcription, editing, or encoding. Its value must point to one or more identifiers declared in the document header. One or more values from [data.URI](#), separated by spaces.

<anchoredText> → att.common → att.responsibility → @resp

**@sameas** (*optional*) Points to an element that is the same as the current element but is not a literal copy of the current element. One or more values from [data.URI](#), separated by spaces.

<anchoredText> → att.common → att.linked → @sameas

**@startid** (*optional*) Holds a reference to the first element in a sequence of events to which the feature applies. Value conforms to [data.URI](#).

<anchoredText> → att.anchoredText.log → att.startId → @startid

**@synch** (*optional*) Points to elements that are synchronous with the current element. One or more values from [data.URI](#), separated by spaces.

<anchoredText> → att.common → att.linked → @synch

**@to** (*optional*) Records a timestamp adjustment of a feature's programmatically-determined location in terms of musical time; that is, beats. Value conforms to [data.TSTAMPOFFSET](#).

<anchoredText> → att.anchoredText.vis → att.visualOffset → att.visualOffset.to → @to

**@translit** (*optional*) Specifies the transliteration technique used. Value is a [NMTOKEN](#).

<anchoredText> → att.lang → @translit

**@type** (*optional*) Designation which characterizes the element in some sense, using any convenient classification scheme or typology that employs single-token labels. One or more values of datatype [NMTOKEN](#), separated by spaces.

<anchoredText> → att.common → att.typed → @type

**@vo** (*optional*) Records the vertical adjustment of a feature's programmatically-determined location in terms of staff interline distance; that is, in units of 1/2 the distance between adjacent staff lines. Value conforms to [data.MEASUREMENTSIGNED](#).

<anchoredText> → att.anchoredText.vis → att.visualOffset → att.visualOffset.vo → @vo

**@x** (*optional*) Encodes an x coordinate for a feature in an output coordinate system. When it is necessary to record the placement of a feature in a facsimile image, use the `facs` attribute. Value is a decimal number.

<anchoredText> → att.anchoredText.vis → att.xy → @x

**@xml:base** (*optional*) Provides a base URI reference with which applications can resolve relative URI references into absolute URI references. Value conforms to [data.URI](#).

<anchoredText> → att.common → att.basic → @xml:base

**@xml:id** (*optional*) Regularizes the naming of an element and thus facilitates building links between it and other resources. Each id attribute within a document must have a unique value. Value is a valid `xml:id`.

<anchoredText> → `att.common` → `att.basic` → `att.id` → `@xml:id`

**@xml:lang** (*optional*) Identifies the language of the element's content. The values for this attribute are language 'tags' as defined in BCP 47. All language tags that make use of private use sub-tags must be documented in a corresponding language element in the MEI header whose id attribute is the same as the language tag's value. Value is a [language](#).

<anchoredText> → `att.lang` → `@xml:lang`

**@y** (*optional*) Encodes a y coordinate for a feature in an output coordinate system. When it is necessary to record the placement of a feature in a facsimile image, use the `fac` attribute. Value is a decimal number.

<anchoredText> → `att.anchoredText.vis` → `att.xy` → `@y`

## Member of

[model.graphicPrimitiveLike](#) Groups elements that function as drawing primitives.

## Contained By

**<abbr>** A generic element for 1) a shortened form of a word, including an acronym or 2) a shorthand notation.

<anchoredText> → `model.graphicPrimitiveLike` → `<abbr>`

**<add>** Marks an addition to the text.

<anchoredText> → `model.graphicPrimitiveLike` → `<add>`

**<attacca>** An instruction to begin the next section or movement of a composition without pause.

<anchoredText> → `model.graphicPrimitiveLike` → `<attacca>`

**<corr>** Contains the correct form of an apparent erroneous passage.

<anchoredText> → `model.graphicPrimitiveLike` → `<corr>`

**<damage>** Contains an area of damage to the physical medium.

<anchoredText> → `model.graphicPrimitiveLike` → `<damage>`

**<del>** Contains information deleted, marked as deleted, or otherwise indicated as superfluous or spurious in the copy text by an author, scribe, annotator, or corrector.

<anchoredText> → `model.graphicPrimitiveLike` → `<del>`

**<dir>** An instruction expressed as a combination of text and symbols, typically above, below, or between staves, but not on the staff — that is not encoded elsewhere in more specific elements, like [<tempo>](#), [<dynam>](#) or [<repeatMark>](#).

<anchoredText> → `model.graphicPrimitiveLike` → `<dir>`

**<ending>** Alternative ending for a repeated passage of music; i.e., *prima volta*, *seconda volta*, etc.

<anchoredText> → `model.graphicPrimitiveLike` → `<ending>`

**<expan>** Contains the expansion of an abbreviation.

<anchoredText> → `model.graphicPrimitiveLike` → `<expan>`

**<harm>** An indication of harmony, e.g., chord names, tablature grids, harmonic analysis, figured bass.

<anchoredText> → `model.graphicPrimitiveLike` → `<harm>`

**<layer>** An independent stream of events on a staff.

<anchoredText> → model.graphicPrimitiveLike → <layer>

**<lem>** (lemma) – Contains the lemma, or base text, of a textual variation.

<anchoredText> → model.graphicPrimitiveLike → <lem>

**<measure>** Unit of musical time consisting of a fixed number of note values of a given type, as determined by the prevailing meter, and delimited in musical notation by bar lines.

<anchoredText> → model.graphicPrimitiveLike → <measure>

**<oLayer>** A layer that contains an alternative to material in another layer.

<anchoredText> → model.graphicPrimitiveLike → <oLayer>

**<oStaff>** A staff that holds an alternative passage which may be played instead of the original material.

<anchoredText> → model.graphicPrimitiveLike → <oStaff>

**<orig>** Contains material which is marked as following the original, rather than being normalized or corrected.

<anchoredText> → model.graphicPrimitiveLike → <orig>

**<ornam>** An element indicating an ornament that is not a mordent, turn, or trill.

<anchoredText> → model.graphicPrimitiveLike → <ornam>

**<part>** An alternative visual rendition of the score from the point of view of a particular performer (or group of performers).

<anchoredText> → model.graphicPrimitiveLike → <part>

**<pgDesc>** Contains a brief prose description of the appearance or description of the content of a physical page.

<anchoredText> → model.graphicPrimitiveLike → <pgDesc>

**<pgFoot>** A running footer.

<anchoredText> → elements having anchoredText as direct children → <pgFoot>

**<pgHead>** A running header.

<anchoredText> → elements having anchoredText as direct children → <pgHead>

**<rdg>** (reading) – Contains a single reading within a textual variation.

<anchoredText> → model.graphicPrimitiveLike → <rdg>

**<reg>** Contains material which has been regularized or normalized in some sense.

<anchoredText> → model.graphicPrimitiveLike → <reg>

**<repeatMark>** An instruction expressed as a combination of text and symbols – segno and coda – typically above, below, or between staves, but not on the staff.

<anchoredText> → model.graphicPrimitiveLike → <repeatMark>

**<restore>** Indicates restoration of material to an earlier state by cancellation of an editorial or authorial marking or instruction.

<anchoredText> → model.graphicPrimitiveLike → <restore>

**<score>** Full score view of the musical content.

<anchoredText> → model.graphicPrimitiveLike → <score>

**<section>** Segment of music data.

<anchoredText> → model.graphicPrimitiveLike → <section>

**<sic>** Contains apparently incorrect or inaccurate material.

<anchoredText> → model.graphicPrimitiveLike → <sic>

**<signifLet>** Significantive letter(s).

<anchoredText> → model.graphicPrimitiveLike → <signifLet>

**<staff>** A group of equidistant horizontal lines on which notes are placed in order to represent pitch or a grouping element for individual 'strands' of notes, rests, etc. that may or may not actually be rendered on staff lines; that is, both diastematic and non-diastematic signs.

<anchoredText> → model.graphicPrimitiveLike → <staff>

**<supplied>** Contains material supplied by the transcriber or editor for any reason.

<anchoredText> → model.graphicPrimitiveLike → <supplied>

**<syllable>** Neume notation can be thought of as "neumed text". Therefore, the syllable element provides high-level organization in this repertoire.

<anchoredText> → model.graphicPrimitiveLike → <syllable>

**<symbolDef>** Declaration of an individual symbol in a symbolTable.

<anchoredText> → model.graphicPrimitiveLike → <symbolDef>

**<tempo>** Text and symbols descriptive of tempo, mood, or style, e.g., "allarg.", "a tempo", "cantabile", "Moderato", "J=60", "Moderato J =60").

<anchoredText> → model.graphicPrimitiveLike → <tempo>

**<unclear>** Contains material that cannot be transcribed with certainty because it is illegible or inaudible in the source.

<anchoredText> → model.graphicPrimitiveLike → <unclear>

## May Contain

**<abbr>** A generic element for 1) a shortened form of a word, including an acronym or 2) a shorthand notation.

<anchoredText> → model.textPhraseLike.limited → model.editorialLike → <abbr>

**<add>** Marks an addition to the text.

<anchoredText> → model.transcriptionLike → <add>

**<address>** Contains a postal address, for example of a publisher, an organization, or an individual.

<anchoredText> → model.textPhraseLike.limited → model.addressLike → <address>

**<annot>** Provides a statement explaining the text or indicating the basis for an assertion.

<anchoredText> → model.textPhraseLike.limited → model.annotLike → <annot>

**<bibl>** Provides a loosely-structured bibliographic citation in which the sub-components may or may not be explicitly marked.

<anchoredText> → model.textPhraseLike.limited → model.biblLike → <bibl>

**<biblStruct>** Contains a bibliographic citation in which bibliographic sub-elements must appear in a specified order.

<anchoredText> → model.textPhraseLike.limited → model.biblLike → <biblStruct>

**<bloc>** Contains the name of a geopolitical unit consisting of two or more nation states or countries.

<anchoredText> → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <bloc>

**<catchwords>** Describes the system used to ensure correct ordering of the quires making up an item, typically by means of annotations at the foot of the page.

<anchoredText> → model.textPhraseLike.limited → model.mslnline → <catchwords>

**<choice>** Groups a number of alternative encodings for the same point in a text.

<anchoredText> → model.editLike → <choice>

**<corpName>** Identifies an organization or group of people that acts as a single entity.

<anchoredText> → model.textPhraseLike.limited → model.nameLike → model.nameLike.agent → <corpName>

**<corr>** Contains the correct form of an apparent erroneous passage.

<anchoredText> → model.transcriptionLike → <corr>

**<country>** Contains the name of a geopolitical unit, such as a nation, country, colony, or commonwealth, larger than or administratively superior to a region and smaller than a bloc.

<anchoredText> → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <country>

**<damage>** Contains an area of damage to the physical medium.

<anchoredText> → model.transcriptionLike → <damage>

**<date>** A string identifying a point in time or the time period between two such points.

<anchoredText> → model.textPhraseLike.limited → model.dateLike → <date>

**<dedicatee>** Entity to whom a creative work is formally offered.

<anchoredText> → model.textPhraseLike.limited → <dedicatee>

**<del>** Contains information deleted, marked as deleted, or otherwise indicated as superfluous or spurious in the copy text by an author, scribe, annotator, or corrector.

<anchoredText> → model.transcriptionLike → <del>

**<depth>** Description of a measurement taken through a three-dimensional object.

<anchoredText> → model.textPhraseLike.limited → model.dimLike → <depth>

**<dim>** Any single dimensional specification.

<anchoredText> → model.textPhraseLike.limited → model.dimLike → <dim>

**<dimensions>** Information about the physical size of an entity; usually includes numerical data.

<anchoredText> → model.textPhraseLike.limited → <dimensions>

**<district>** Contains the name of any kind of subdivision of a settlement, such as a parish, ward, or other administrative or geographic unit.

<anchoredText> → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <district>

**<expan>** Contains the expansion of an abbreviation.

<anchoredText> → model.textPhraseLike.limited → model.editorialLike → <expan>

**<extent>** Used to express size in terms other than physical dimensions, such as number of pages, records, bytes, physical components, etc.

<anchoredText> → model.textPhraseLike.limited → <extent>

**<fig>** Groups elements representing or containing graphic information such as an illustration or figure.

<anchoredText> → model.textPhraseLike.limited → model.figureLike → <fig>

**<gap>** Indicates a point where material has been omitted in a transcription, whether as part of sampling practice or for editorial reasons described in the MEI header.

<anchoredText> → model.transcriptionLike → <gap>

**<geogFeat>** Contains a common noun identifying a geographical feature.

<anchoredText> → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <geogFeat>

**<geogName>** The proper noun designation for a place, natural feature, or political jurisdiction.

<anchoredText> → model.textPhraseLike.limited → model.nameLike → model.nameLike.place → model.nameLike.geogName → <geogName>

**<handShift>** Marks the beginning of a passage written in a new hand, or of a change in the scribe, writing style, ink or character of the document hand.

<anchoredText> → model.transcriptionLike → <handShift>

**<height>** Description of the vertical size of an object.

<anchoredText> → model.textPhraseLike.limited → model.dimLike → <height>

**<heraldry>** Contains a heraldic formula or phrase, typically found as part of a blazon, coat of arms, etc.

<anchoredText> → model.textPhraseLike.limited → model.mslinline → <heraldry>

**<identifier>** An alpha-numeric string that establishes the identity of the described material.

<anchoredText> → model.textPhraseLike.limited → model.identifierLike → <identifier>

**<lb>** An empty formatting element that forces text to begin on a new line.

<anchoredText> → model.textPhraseLike.limited → model.lbLike → <lb>

**<locus>** Defines a location within a manuscript or manuscript component, usually as a (possibly discontinuous) sequence of folio references.

<anchoredText> → model.textPhraseLike.limited → model.mslinline → <locus>

**<locusGrp>** Groups locations which together form a distinct but discontinuous item within a manuscript or manuscript part, according to a specific foliation.

<anchoredText> → model.textPhraseLike.limited → model.mslinline → <locusGrp>

**<name>** Proper noun or noun phrase.

<anchoredText> → model.textPhraseLike.limited → model.nameLike → <name>

**<num>** Numeric information in any form.

<anchoredText> → model.textPhraseLike.limited → model.measurementLike → model.numLike → <num>

**<orig>** Contains material which is marked as following the original, rather than being normalized or corrected.

<anchoredText> → model.transcriptionLike → <orig>

**<periodName>** A label that describes a period of time, such as 'Baroque' or '3rd Style period'.

<anchoredText> → model.textPhraseLike.limited → model.nameLike.label → <periodName>

**<persName>** Designation for an individual, including any or all of that individual's forenames, surnames, honorific titles, and added names.

<anchoredText> → model.textPhraseLike.limited → model.nameLike → model.nameLike.agent → <persName>

**<postBox>** (postal box or post office box) contains a number or other identifier for some postal delivery point other than a street address.

<anchoredText> → model.textPhraseLike.limited → model.addressPart → <postBox>

**<postCode>** (postal code) contains a numerical or alphanumeric code used as part of a postal address to simplify sorting or delivery of mail.

<anchoredText> → model.textPhraseLike.limited → model.addressPart → <postCode>

**<ptr>** Defines a traversible pointer to another location, using only attributes to describe the destination.

<anchoredText> → model.textPhraseLike.limited → model.locrefLike → <ptr>

**<q>** Contains material which is distinguished from the surrounding phrase-level text using quotation marks or a similar method. Use <quote> for block-level quotations.

<anchoredText> → model.textPhraseLike.limited → model.qLike → <q>

**<ref>** Defines a traversible reference to another location. May contain text and sub-elements that describe the destination.

<anchoredText> → model.textPhraseLike.limited → model.locrefLike → <ref>

**<reg>** Contains material which has been regularized or normalized in some sense.

<anchoredText> → model.transcriptionLike → <reg>

**<region>** Contains the name of an administrative unit such as a state, province, or county, larger than a settlement, but smaller than a country.

<anchoredText> → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <region>

**<relation>** Describes a relationship or linkage amongst entities.

<anchoredText> → model.textPhraseLike.limited → model.relationLike → <relation>

**<relationList>** Gathers relation elements.

<anchoredText> → model.textPhraseLike.limited → model.relationLike → <relationList>

**<rend>** A formatting element indicating special visual rendering, e.g., bold or italicized, of a text word or phrase.

<anchoredText> → model.textPhraseLike.limited → model.rendLike → <rend>

**<repository>** Institution, agency, or individual which holds a bibliographic item.

<anchoredText> → model.textPhraseLike.limited → model.nameLike → model.nameLike.place → model.repositoryLike → <repository>

**<restore>** Indicates restoration of material to an earlier state by cancellation of an editorial or authorial marking or instruction.

<anchoredText> → model.transcriptionLike → <restore>

**<secFolio>** Marks the word or words taken from a fixed point in a codex (typically the beginning of the second leaf) in order to provide a unique identifier for the item.

<anchoredText> → model.textPhraseLike.limited → model.mslInline → <secFolio>

**<seg>** (arbitrary segment) represents any segmentation of text below the "text component" level.

<anchoredText> → model.textPhraseLike.limited → <seg>

**<settlement>** Contains the name of a settlement such as a city, town, or village identified as a single geopolitical or administrative unit.

<anchoredText> → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <settlement>

**<sic>** Contains apparently incorrect or inaccurate material.

<anchoredText> → model.transcriptionLike → <sic>

**<signatures>** Provides a description of the leaf or quire signatures found within a codex.

<anchoredText> → model.textPhraseLike.limited → model.mslInline → <signatures>

**<stack>** An inline table with a single column.

<anchoredText> → model.textPhraseLike.limited → model.rendLike → <stack>

**<stamp>** Contains a word or phrase describing an official mark indicating ownership, genuineness, validity, etc.

<anchoredText> → model.textPhraseLike.limited → model.mslInline → <stamp>

**<street>** full street address including any name or number identifying a building as well as the name of the street or route on which it is located.

<anchoredText> → model.textPhraseLike.limited → model.addressPart → <street>

**<styleName>** A label for a characteristic style of writing or performance, such as 'bebop' or 'rock-n-roll'.

<anchoredText> → model.textPhraseLike.limited → model.nameLike.label → <styleName>

**<subst>** Groups transcriptional elements when the combination is to be regarded as a single intervention in the text.

<anchoredText> → model.editLike → <subst>

**<supplied>** Contains material supplied by the transcriber or editor for any reason.

<anchoredText> → model.transcriptionLike → <supplied>

**<symbol>** A reference to a previously defined symbol.

<anchoredText> → model.textPhraseLike.limited → <symbol>

**<term>** Keyword or phrase which describes a resource.

<anchoredText> → model.textPhraseLike.limited → <term>

**<title>** Title of a bibliographic entity.

<anchoredText> → model.textPhraseLike.limited → model.titleLike → <title>

**<unclear>** Contains material that cannot be transcribed with certainty because it is illegible or inaudible in the source.

<anchoredText> → model.transcriptionLike → <unclear>

**<watermark>** Contains a description of a watermark or similar device.

<anchoredText> → model.textPhraseLike.limited → model.mslInLine → <watermark>

**<width>** Description of the horizontal size of an object.

<anchoredText> → model.textPhraseLike.limited → model.dimLike → <width>

## Remarks

This element may be used where semantic markup of the text is neither possible nor desirable, such as in optical music recognition (OMR) applications. The content model here is similar to paragraph without model.textcomponent and <pb> sub-elements. The starting point of the text may be identified in absolute output coordinate terms using the x and y attributes or relative to the location of another element using the startid attribute. The attributes in the att.visualOffset class may be used to record horizontal, vertical, or time offsets from the absolute coordinates or from the location of the referenced element.

## Declaration

```

## <annot>

(annotation) – Provides a statement explaining the text or indicating the basis for an assertion.

### Referenced in chapters

[3.4.1.5 Notes Statement](#), [3.6.2 Incipits](#), [9 Text Encoding](#), [9.2.1 Paragraphs](#), [9.2.12 Bibliographic Citations and References](#), [9.2.13 Annotations](#), [10.1.1 General Relationships Between Elements](#), [11.2.4.1 Omissions, Unclear Readings, Damage, and Supplied Readings](#)

### Module

[MEI.shared](#)

### Attributes

**@analog** (*optional*) Contains a reference to a field or element in another descriptive encoding system to which this MEI element is comparable. Value is plain text.

<annot> → [att.bibl](#) → @analog

**@audience** (*optional*) The intended audience. Allowed values are: "private" (*Internal use only.*), "public" (*Available to all audiences.*)

<annot> → [att.audience](#) → @audience

**@class** (*optional*) Contains one or more URIs which denote classification terms that apply to the entity bearing this attribute. One or more values from [data.URI](#), separated by spaces.

<annot> → [att.common](#) → [att.typed](#) → [att.classed](#) → @class

**@copyof** (*optional*) Points to an element of which the current element is a copy. Value conforms to [data.URI](#).

<annot> → [att.common](#) → [att.linkin](#) → @copyof

**@corresp** (*optional*) Used to point to other elements that correspond to this one in a generic fashion. One or more values from [data.URI](#), separated by spaces.

<annot> → [att.common](#) → [att.linkin](#) → @corresp

**@data** (*optional*) Used to link metadata elements to one or more data-containing elements. One or more values from [data.URI](#), separated by spaces.

<annot> → [att.dataPointing](#) → @data

**@dots.ges** (*optional*) Number of dots required for a gestural duration when different from that of the written duration. Value conforms to [data.AUGMENTDOT](#).

<annot> → [att.annot.ges](#) → [att.duration.ges](#) → @dots.ges

**@dur** (*optional*) When a duration cannot be represented as a single power-of-two value, multiple space-separated values that add up to the total duration may be used. One or more values from [data.DURATION](#), separated by spaces.

<annot> → [att.annot.log](#) → [att.duration.additive](#) → @dur

**@dur.ges** (*optional*) Records performed duration information that differs from the written duration.

Value conforms to [data.DURATION.GESTURAL](#).

<annot> → [att.annot.ges](#) → [att.duration.ges](#) → @dur.ges

**@dur.metrical** (*optional*) Duration as a count of units provided in the time signature denominator. Value is a decimal number.

<annot> → att.annot.ges → att.duration.ges → @dur.metrical

**@dur.ppq** (*optional*) Duration recorded as pulses-per-quarter note, e.g., MIDI clicks or MusicXML divisions. Value is a positive integer, including 0.

<annot> → att.annot.ges → att.duration.ges → @dur.ppq

**@dur.real** (*optional*) Duration in seconds, e.g., 1.732. Value is a decimal number.

<annot> → att.annot.ges → att.duration.ges → @dur.real

**@dur.recip** (*optional*) Duration as an optionally dotted Humdrum **\*\*recip value**. Value is a **token**.

<annot> → att.annot.ges → att.duration.ges → @dur.recip

**@endid** (*optional*) Indicates the final element in a sequence of events to which the feature applies. Value conforms to **data.URI**.

<annot> → att.annot.log → att.startEndId → @endid

**@evaluate** (*optional*) Specifies the intended meaning when a participant in a relationship is itself a pointer. Allowed values are: "**all**" (*If an element pointed to is itself a pointer, then the target of that pointer will be taken, and so on, until an element is found which is not a pointer.*), "**one**" (*If an element pointed to is itself a pointer, then its target (whether a pointer or not) is taken as the target of this pointer.*), "**none**" (*No further evaluation of targets is carried out beyond that needed to find the element(s) specified in plist or target attribute.*)

<annot> → att.targetEval → @evaluate

**@facsimile** (*optional*) Points to one or more images, portions of an image, or surfaces which correspond to the current element. One or more values from **data.URI**, separated by spaces.

<annot> → att.facsimile → @facsimile

**@follows** (*optional*) points to one or more events in a user-defined collection that are known to be predecessors of the current element. One or more values from **data.URI**, separated by spaces.

<annot> → att.common → att.linked → @follows

**@label** (*optional*) Captures text to be used to generate a label for the element to which it's attached, a "tool tip" or prefatory text, for example. Should not be used to record document content. Value is plain text.

<annot> → att.common → att.labelled → @label

**@layer** (*optional*) Identifies the layer to which a feature applies. One or more values of datatype **positiveInteger**, separated by spaces.

<annot> → att.annot.log → att.layerIdent → @layer

**@n** (*optional*) Provides a number-like designation that indicates an element's position in a sequence of similar elements. May not contain space characters. Value conforms to **data.WORD**.

<annot> → att.common → att.nNumberLike → @n

**@next** (*optional*) Used to point to the next event(s) in a user-defined collection. One or more values from **data.URI**, separated by spaces.

<annot> → att.common → att.linked → @next

**@part** (*optional*) Indicates the part in which the current feature should appear. Use '%all' when the feature should occur in every part. One or more values of datatype **a string matching the following regular expression: "(%all|#[\w][\w]+)"**, separated by spaces.

<annot> → att.annot.log → att.partIdent → @part

**@partstaff** (*optional*) Signifies the part staff on which a notated feature occurs. Use '%all' when the feature should occur on every staff. One or more values of datatype **a string matching the following regular expression: "(%all|\d+(-\d+)?)"**, separated by spaces.

<annot> → att.annot.log → att.partIdent → @partstaff

**@place** (*optional*) Location of the annotation. One or more values from [data.PLACEMENT](#), separated by spaces.

<annot> → att.annot.vis → @place

**@plist** (*optional*) When the target attribute is present, plist identifies the active participants; that is, those entities pointed "from", in a relationship with the specified target(s). When the target attribute is not present, it identifies participants in a mutual relationship. One or more values from [data.URI](#), separated by spaces.

<annot> → att.plist → @plist

**@precedes** (*optional*) Points to one or more events in a user-defined collection that are known to be successors of the current element. One or more values from [data.URI](#), separated by spaces.

<annot> → att.common → att.linking → @precedes

**@prev** (*optional*) Points to the previous event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<annot> → att.common → att.linking → @prev

**@resp** (*optional*) Indicates the agent(s) responsible for some aspect of the text's transcription, editing, or encoding. Its value must point to one or more identifiers declared in the document header. One or more values from [data.URI](#), separated by spaces.

<annot> → att.common → att.responsibility → @resp

**@sameas** (*optional*) Points to an element that is the same as the current element but is not a literal copy of the current element. One or more values from [data.URI](#), separated by spaces.

<annot> → att.common → att.linking → @sameas

**@source** (*optional*) Contains a list of one or more pointers indicating the sources which attest to a given reading. Each value should correspond to the ID of a [<source>](#) or [<manifestation>](#) element located in the document header. One or more values from [data.URI](#), separated by spaces.

<annot> → att.source → @source

**@staff** (*recommended*) Signifies the staff on which a notated event occurs or to which a control event applies. Mandatory when applicable. One or more values of datatype **positiveInteger**, separated by spaces.

<annot> → att.annot.log → att.staffIdent → @staff

**@startid** (*optional*) Holds a reference to the first element in a sequence of events to which the feature applies. Value conforms to [data.URI](#).

<annot> → att.annot.log → att.startEndId → att.startId → @startid

**@synch** (*optional*) Points to elements that are synchronous with the current element. One or more values from [data.URI](#), separated by spaces.

<annot> → att.common → att.linking → @synch

**@translit** (*optional*) Specifies the transliteration technique used. Value is a [NMTOKEN](#).

<annot> → att.lang → @translit

**@tstamp** (*optional*) Encodes the onset time in terms of musical time, i.e., beats[.fractional beat part], as expressed in the written time signature. Value conforms to [data.BEAT](#).

<annot> → [att.annot.log](#) → [att.timestamp.log](#) → @tstamp

**@tstamp.ges** (*optional*) Encodes the onset time in terms of musical time, i.e., beats[.fractional beat part], as expressed in the written time signature. Value conforms to [data.BEAT](#).

<annot> → [att.annot.ges](#) → [att.timestamp.ges](#) → @tstamp.ges

**@tstamp.real** (*optional*) Records the onset time in terms of ISO time. Value conforms to [data.ISOTIME](#).

<annot> → [att.annot.ges](#) → [att.timestamp.ges](#) → @tstamp.real

**@tstamp2** (*optional*) Encodes the ending point of an event, i.e., a count of measures plus a beat location in the ending measure. Value conforms to [data.MEASUREBEAT](#).

<annot> → [att.annot.log](#) → [att.timestamp2.log](#) → @tstamp2

**@tstamp2.ges** (*optional*) Encodes the ending point of an event, i.e., a count of measures plus a beat location in the ending measure. Value conforms to [data.MEASUREBEAT](#).

<annot> → [att.annot.ges](#) → [att.timestamp2.ges](#) → @tstamp2.ges

**@tstamp2.real** (*optional*) Records the ending point of an event in terms of ISO time. Value conforms to [data.ISOTIME](#).

<annot> → [att.annot.ges](#) → [att.timestamp2.ges](#) → @tstamp2.real

**@type** (*optional*) Designation which characterizes the element in some sense, using any convenient classification scheme or typology that employs single-token labels. One or more values of datatype **NMTOKEN**, separated by spaces.

<annot> → [att.common](#) → [att.typed](#) → @type

**@when** (*optional*) Indicates the point of occurrence of this feature along a time line. Its value must be the ID of a [<when>](#) element elsewhere in the document. Value conforms to [data.URI](#).

<annot> → [att.annot.log](#) → [att.alignment](#) → @when

**@xml:base** (*optional*) Provides a base URI reference with which applications can resolve relative URI references into absolute URI references. Value conforms to [data.URI](#).

<annot> → [att.common](#) → [att.basic](#) → @xml:base

**@xml:id** (*optional*) Regularizes the naming of an element and thus facilitates building links between it and other resources. Each id attribute within a document must have a unique value. Value is a valid [xml:id](#).

<annot> → [att.common](#) → [att.basic](#) → [att.id](#) → @xml:id

**@xml:lang** (*optional*) Identifies the language of the element's content. The values for this attribute are language 'tags' as defined in BCP 47. All language tags that make use of private use sub-tags must be documented in a corresponding language element in the MEI header whose id attribute is the same as the language tag's value. Value is a [language](#).

<annot> → [att.lang](#) → @xml:lang

## Member of

[model.annotLike](#) Groups annotation-like elements.

## Contained By

**<abbr>** A generic element for 1) a shortened form of a word, including an acronym or 2) a shorthand notation.

<annot> → model.annotLike → model.textPhraseLike.limited → model.editTransPart.text → model.editTransPart → <abbr>

**<acquisition>** Records information concerning the process by which an item was acquired by the holding institution.

<annot> → model.annotLike → model.textPhraseLike.limited → <acquisition>

**<actor>** Name of an actor appearing within a cast list.

<annot> → model.annotLike → model.textPhraseLike.limited → <actor>

**<add>** Marks an addition to the text.

<annot> → model.annotLike → model.textPhraseLike.limited → model.editTransPart.text → model.editTransPart → <add>

**<addName>** Contains an additional name component, such as a nickname, epithet, or alias, or any other descriptive phrase used within a personal name.

<annot> → model.annotLike → model.textPhraseLike.limited → model.textPhraseLike → <addName>

**<addrLine>** Single line of a postal address.

<annot> → model.annotLike → model.textPhraseLike.limited → model.textPhraseLike → <addrLine>

**<anchoredText>** Container for text that is fixed to a particular page location, regardless of changes made to the layout of the measures around it.

<annot> → model.annotLike → model.textPhraseLike.limited → <anchoredText>

**<annot>** Provides a statement explaining the text or indicating the basis for an assertion.

<annot> → model.annotLike → model.textPhraseLike.limited → model.textPhraseLike → <annot>

**<arranger>** A person or organization who transcribes a musical composition, usually for a different medium from that of the original; in an arrangement the musical substance remains essentially unchanged.

<annot> → model.annotLike → model.textPhraseLike.limited → <arranger>

**<attacca>** An instruction to begin the next section or movement of a composition without pause.

<annot> → model.annotLike → model.textPhraseLike.limited → <attacca>

**<author>** The name of the creator of the intellectual content of a non-musical, literary work.

<annot> → model.annotLike → model.textPhraseLike.limited → <author>

**<bibl>** Provides a loosely-structured bibliographic citation in which the sub-components may or may not be explicitly marked.

<annot> → model.annotLike → model.textPhraseLike.limited → model.textPhraseLike → <bibl>

**<biblScope>** Defines the scope of a bibliographic reference, for example as a list of page numbers, or a named subdivision of a larger work.

<annot> → model.annotLike → model.textPhraseLike.limited → <biblScope>

**<biblStruct>** Contains a bibliographic citation in which bibliographic sub-elements must appear in a specified order.

<annot> → model.annotLike → <biblStruct>

**<bindingDesc>** Describes the present and former bindings of an item.

<annot> → model.annotLike → model.textPhraseLike.limited → <bindingDesc>

**<bloc>** Contains the name of a geopolitical unit consisting of two or more nation states or countries.

<annot> → model.annotLike → model.textPhraseLike.limited → model.textPhraseLike → <bloc>

**<bracketSpan>** Marks a sequence of notational events grouped by a bracket.

<annot> → model.annotLike → model.textPhraseLike.limited → <bracketSpan>

**<byline>** Contains the primary statement of responsibility given for a work on its title page.

<annot> → model.annotLike → model.textPhraseLike.limited → <byline>

**<caption>** A label which accompanies an illustration or a table.

<annot> → model.annotLike → model.textPhraseLike.limited → model.textPhraseLike → <caption>

**<composer>** The name of the creator of the intellectual content of a musical work.

<annot> → model.annotLike → model.textPhraseLike.limited → <composer>

**<contentItem>** Contains a single entry within a content description element.

<annot> → model.annotLike → model.textPhraseLike.limited → model.textPhraseLike → <contentItem>

**<contributor>** Names of individuals, institutions, or organizations responsible for contributions to the intellectual content of a work, where the specialized elements for authors, editors, etc. do not suffice or do not apply.

<annot> → model.annotLike → model.textPhraseLike.limited → <contributor>

**<corpName>** Identifies an organization or group of people that acts as a single entity.

<annot> → model.annotLike → model.textPhraseLike.limited → model.textPhraseLike → <corpName>

**<corr>** Contains the correct form of an apparent erroneous passage.

<annot> → model.annotLike → model.textPhraseLike.limited → model.editTransPart.text → model.editTransPart → <corr>

**<country>** Contains the name of a geopolitical unit, such as a nation, country, colony, or commonwealth, larger than or administratively superior to a region and smaller than a bloc.

<annot> → model.annotLike → model.textPhraseLike.limited → model.textPhraseLike → <country>

**<cpMark>** A verbal or graphical indication to copy musical material written elsewhere.

<annot> → model.annotLike → model.textPhraseLike.limited → <cpMark>

**<creation>** Non-bibliographic details of the creation of an intellectual entity, in narrative form, such as the date, place, and circumstances of its composition. More detailed information may be captured within the history element.

<annot> → model.annotLike → model.textPhraseLike.limited → <creation>

**<damage>** Contains an area of damage to the physical medium.

<annot> → model.annotLike → model.textPhraseLike.limited → model.editTransPart.text → model.editTransPart → <damage>

**<date>** A string identifying a point in time or the time period between two such points.

<annot> → model.annotLike → model.textPhraseLike.limited → model.textPhraseLike → <date>

**<decoDesc>** Contains a description of the decoration of an item.

<annot> → model.annotLike → model.textPhraseLike.limited → <decoDesc>

**<decoNote>** Contains a description of one or more decorative features of an item.

<annot> → model.annotLike → model.textPhraseLike.limited → <decoNote>

**<dedicatee>** Entity to whom a creative work is formally offered.

<annot> → model.annotLike → model.textPhraseLike.limited → <dedicatee>

**<dedication>** Contains a dedicatory statement.

<annot> → model.annotLike → model.textPhraseLike.limited → <dedication>

**<del>** Contains information deleted, marked as deleted, or otherwise indicated as superfluous or spurious in the copy text by an author, scribe, annotator, or corrector.

<annot> → model.annotLike → model.textPhraseLike.limited → model.editTransPart.text → model.editTransPart → <del>

**<depth>** Description of a measurement taken through a three-dimensional object.

<annot> → model.annotLike → model.textPhraseLike.limited → <depth>

**<desc>** Container for text that briefly describes the feature to which it is attached, including its intended usage, purpose, or application as appropriate.

<annot> → model.annotLike → model.textPhraseLike.limited → <desc>

**<dim>** Any single dimensional specification.

<annot> → model.annotLike → model.textPhraseLike.limited → <dim>

**<dir>** An instruction expressed as a combination of text and symbols, typically above, below, or between staves, but not on the staff — that is not encoded elsewhere in more specific elements, like <tempo>, <dynam> or <repeatMark>.

<annot> → model.annotLike → model.textPhraseLike.limited → <dir>

**<distributor>** Person or agency, other than a publisher, from which access (including electronic access) to a bibliographic entity may be obtained.

<annot> → model.annotLike → model.textPhraseLike.limited → <distributor>

**<district>** Contains the name of any kind of subdivision of a settlement, such as a parish, ward, or other administrative or geographic unit.

<annot> → model.annotLike → model.textPhraseLike.limited → model.textPhraseLike → <district>

**<dynam>** Indication of the volume of a note, phrase, or section of music.

<annot> → model.annotLike → model.textPhraseLike.limited → <dynam>

**<edition>** A word or text phrase that indicates a difference in either content or form between the item being described and a related item previously issued by the same publisher/distributor (e.g., 2nd edition, version 2.0, etc.), or simultaneously issued by either the same publisher/distributor or another publisher/distributor (e.g., large print edition, British edition, etc.).

<annot> → model.annotLike → model.textPhraseLike.limited → <edition>

**<editor>** The name of the individual(s), institution(s) or organization(s) acting in an editorial capacity.

<annot> → model.annotLike → model.textPhraseLike.limited → <editor>

**<ending>** Alternative ending for a repeated passage of music; i.e., prima volta, seconda volta, etc.

<annot> → model.annotLike → <ending>

**<epigraph>** Contains a quotation, anonymous or attributed, appearing on a title page.

<annot> → model.annotLike → model.textPhraseLike.limited → model.textPhraseLike → model.paracontentPart → <epigraph>

**<exhibHist>** A record of public exhibitions, including dates, venues, etc.

<annot> → model.annotLike → model.textPhraseLike.limited → <exhibHist>

**<expan>** Contains the expansion of an abbreviation.

<annot> → model.annotLike → model.textPhraseLike.limited → model.editTransPart.text → model.editTransPart → <expan>

**<extent>** Used to express size in terms other than physical dimensions, such as number of pages, records, bytes, physical components, etc.

<annot> → model.annotLike → model.textPhraseLike.limited → <extent>

**<f>** Single element of a figured bass indication.

<annot> → model.annotLike → model.textPhraseLike.limited → <f>

**<famName>** Contains a family (inherited) name, as opposed to a given, baptismal, or nick name.

<annot> → model.annotLike → model.textPhraseLike.limited → model.textPhraseLike → <famName>

**<figDesc>** Contains a brief prose description of the appearance or content of a graphic figure, for use when documenting an image without displaying it.

<annot> → model.annotLike → model.textPhraseLike.limited → <figDesc>

**<fing>** finger – An individual finger in a fingering indication.

<annot> → model.annotLike → model.textPhraseLike.limited → <fing>

**<foreName>** Contains a forename, given or baptismal name.

<annot> → model.annotLike → model.textPhraseLike.limited → model.textPhraseLike → <foreName>

**<funder>** Names of individuals, institutions, or organizations responsible for funding. Funders provide financial support for a project; they are distinct from sponsors, who provide intellectual support and authority.

<annot> → model.annotLike → model.textPhraseLike.limited → <funder>

**<genName>** Contains a name component used to distinguish otherwise similar names on the basis of the relative ages or generations of the persons named.

<annot> → model.annotLike → model.textPhraseLike.limited → model.textPhraseLike → <genName>

**<genre>** Term or terms that designate a category characterizing a particular style, form, or content.

<annot> → model.annotLike → model.textPhraseLike.limited → <genre>

**<geogFeat>** Contains a common noun identifying a geographical feature.

<annot> → model.annotLike → model.textPhraseLike.limited → model.textPhraseLike → <geogFeat>

**<geogName>** The proper noun designation for a place, natural feature, or political jurisdiction.

<annot> → model.annotLike → model.textPhraseLike.limited → model.textPhraseLike → <geogName>

**<gliss>** A continuous or sliding movement from one pitch to another, usually indicated by a straight or wavy line.

<annot> → model.annotLike → model.textPhraseLike.limited → <gliss>

**<hand>** Defines a distinct scribe or handwriting style.

<annot> → model.annotLike → model.textPhraseLike.limited → <hand>

**<harm>** An indication of harmony, e.g., chord names, tablature grids, harmonic analysis, figured bass.

<annot> → model.annotLike → model.textPhraseLike.limited → <harm>

**<head>** Contains any heading, for example, the title of a section of text, or the heading of a list.

<annot> → model.annotLike → model.textPhraseLike.limited → model.textPhraseLike → <head>

**<height>** Description of the vertical size of an object.

<annot> → model.annotLike → model.textPhraseLike.limited → <height>

**<identifier>** An alpha-numeric string that establishes the identity of the described material.

<annot> → model.annotLike → model.textPhraseLike.limited → model.textPhraseLike → <identifier>

**<imprimatur>** Contains a formal statement authorizing the publication of a work, sometimes required to appear on a title page or its verso.

<annot> → model.annotLike → model.textPhraseLike.limited → model.textPhraseLike → model.paracontentPart → <imprimatur>

**<imprint>** Information relating to the publication or distribution of a bibliographic item.

<annot> → model.annotLike → model.textPhraseLike.limited → model.textPhraseLike → <imprint>

**<incip>** The opening music and/or words of a musical or textual work.

<annot> → model.annotLike → <incip>

**<|>** Contains a single line of text within a line group.

<annot> → model.annotLike → model.textPhraseLike.limited → model.textPhraseLike → <|>

**<label>** A container for document text that identifies the feature to which it is attached. For a "tool tip" or other generated label, use the label attribute.

<annot> → model.annotLike → model.textPhraseLike.limited → <label>

**<labelAbbr>** A label on the pages following the first.

<annot> → model.annotLike → model.textPhraseLike.limited → <labelAbbr>

**<language>** Description of a language used in the document.

<annot> → model.annotLike → model.textPhraseLike.limited → <language>

**<layer>** An independent stream of events on a staff.

<annot> → model.annotLike → <layer>

**<layoutDesc>** Collects layout descriptions.

<annot> → model.annotLike → model.textPhraseLike.limited → <layoutDesc>

**<lem>** (lemma) – Contains the lemma, or base text, of a textual variation.

<annot> → model.annotLike → model.textPhraseLike.limited → model.rdgPart.text → model.rdgPart → <lem>

**<li>** Single item in a <list>.

<annot> → model.annotLike → model.textPhraseLike.limited → model.textPhraseLike → <li>

**<librettist>** Person or organization who is a writer of the text of an opera, oratorio, etc.

<annot> → model.annotLike → model.textPhraseLike.limited → <librettist>

**<line>** A visual line that cannot be represented by a more specific; i.e., semantic, element.

<annot> → model.annotLike → model.textPhraseLike.limited → <line>

**<lyricist>** Person or organization who is a writer of the text of a song.

<annot> → model.annotLike → model.textPhraseLike.limited → <lyricist>

**<measure>** Unit of musical time consisting of a fixed number of note values of a given type, as determined by the prevailing meter, and delimited in musical notation by bar lines.

<annot> → model.annotLike → <measure>

**<metaMark>** A graphical or textual statement with additional / explanatory information about the musical text. The textual consequences of this intervention are encoded independently via other means; that is, with elements such as <add>, <del>, etc.

<annot> → model.annotLike → model.textPhraseLike.limited → <metaMark>

**<monogr>** Contains bibliographic elements describing an item, for example, a published book or journal, score, recording, or an unpublished manuscript.

<annot> → model.annotLike → <monogr>

**<name>** Proper noun or noun phrase.

<annot> → model.annotLike → model.textPhraseLike.limited → model.textPhraseLike → <name>

**<nameLink>** Contains a connecting phrase or link used within a name but not regarded as part of it, such as "van der" or "of", "from", etc.

<annot> → model.annotLike → model.textPhraseLike.limited → model.textPhraseLike → <nameLink>

**<notesStmt>** (notes statement)– Collects any notes providing information about a text additional to that recorded in other parts of the bibliographic description.

<annot> → model.annotLike → <notesStmt>

**<num>** Numeric information in any form.

<annot> → model.annotLike → model.textPhraseLike.limited → model.textPhraseLike → <num>

**<oLayer>** A layer that contains an alternative to material in another layer.

<annot> → model.annotLike → <oLayer>

**<oStaff>** A staff that holds an alternative passage which may be played instead of the original material.

<annot> → model.annotLike → <oStaff>

**<octave>** An indication that a passage should be performed one or more octaves above or below its written pitch.

<annot> → model.annotLike → model.textPhraseLike.limited → <octave>

**<orig>** Contains material which is marked as following the original, rather than being normalized or corrected.

<annot> → model.annotLike → model.textPhraseLike.limited → model.editTransPart.text → model.editTransPart → <orig>

**<ornam>** An element indicating an ornament that is not a mordent, turn, or trill.

<annot> → model.annotLike → model.textPhraseLike.limited → <ornam>

**<p>** One or more text phrases that form a logical prose passage.

<annot> → model.annotLike → model.textPhraseLike.limited → model.textPhraseLike → model.paracontentPart → <p>

**<part>** An alternative visual rendition of the score from the point of view of a particular performer (or group of performers).

<annot> → model.annotLike → <part>

**<perfMedium>** Indicates the number and character of the performing forces used in a musical composition.

<annot> → model.annotLike → <perfMedium>

**<perfRes>** Name of an instrument on which a performer plays, a performer's voice range, or a standard performing ensemble designation.

<annot> → model.annotLike → model.textPhraseLike.limited → <perfRes>

**<perfResList>** Several instrumental or vocal resources treated as a group.

<annot> → elements having annot as direct children → <perfResList>

**<periodName>** A label that describes a period of time, such as 'Baroque' or '3rd Style period'.

<annot> → model.annotLike → model.textPhraseLike.limited → model.textPhraseLike → <periodName>

**<persName>** Designation for an individual, including any or all of that individual's forenames, surnames, honorific titles, and added names.

<annot> → model.annotLike → model.textPhraseLike.limited → model.textPhraseLike → <persName>

**<pgDesc>** Contains a brief prose description of the appearance or description of the content of a physical page.

<annot> → model.annotLike → <pgDesc>

**<pgFoot>** A running footer.

<annot> → model.annotLike → model.textPhraseLike.limited → <pgFoot>

**<pgHead>** A running header.

<annot> → model.annotLike → model.textPhraseLike.limited → <pgHead>

**<price>** The cost of access to a bibliographic item.

<annot> → model.annotLike → model.textPhraseLike.limited → <price>

**<provenance>** The record of ownership or custodianship of an item.

<annot> → model.annotLike → model.textPhraseLike.limited → <provenance>

**<pubPlace>** Name of the place where a bibliographic item was published.

<annot> → model.annotLike → model.textPhraseLike.limited → <pubPlace>

**<publisher>** Name of the organization responsible for the publication of a bibliographic item.

<annot> → model.annotLike → model.textPhraseLike.limited → <publisher>

**<q>** Contains material which is distinguished from the surrounding phrase-level text using quotation marks or a similar method. Use <quote> for block-level quotations.

<annot> → model.annotLike → model.textPhraseLike.limited → model.textPhraseLike → <q>

**<quote>** Contains a paragraph-like block of text attributed to an external source, normally set off from the surrounding text by spacing or other typographic distinction.

<annot> → model.annotLike → model.textPhraseLike.limited → model.textPhraseLike → model.paracontentPart → <quote>

**<rdg>** (reading) – Contains a single reading within a textual variation.

<annot> → model.annotLike → model.textPhraseLike.limited → model.rdgPart.text → model.rdgPart → <rdg>

**<recipient>** The name of the individual(s), institution(s) or organization(s) receiving correspondence.

<annot> → model.annotLike → model.textPhraseLike.limited → <recipient>

**<ref>** Defines a traversible reference to another location. May contain text and sub-elements that describe the destination.

<annot> → model.annotLike → model.textPhraseLike.limited → model.textPhraseLike → <ref>

**<reg>** Contains material which has been regularized or normalized in some sense.

<annot> → model.annotLike → model.textPhraseLike.limited → model.editTransPart.text → model.editTransPart → <reg>

**<region>** Contains the name of an administrative unit such as a state, province, or county, larger than a settlement, but smaller than a country.

<annot> → model.annotLike → model.textPhraseLike.limited → model.textPhraseLike → <region>

**<rend>** A formatting element indicating special visual rendering, e.g., bold or italicized, of a text word or phrase.

<annot> → model.annotLike → model.textPhraseLike.limited → model.textPhraseLike → <rend>

**<repeatMark>** An instruction expressed as a combination of text and symbols – segno and coda – typically above, below, or between staves, but not on the staff.

<annot> → model.annotLike → model.textPhraseLike.limited → <repeatMark>

**<repository>** Institution, agency, or individual which holds a bibliographic item.

<annot> → model.annotLike → model.textPhraseLike.limited → <repository>

**<resp>** A phrase describing the nature of intellectual responsibility.

<annot> → model.annotLike → model.textPhraseLike.limited → <resp>

**<restore>** Indicates restoration of material to an earlier state by cancellation of an editorial or authorial marking or instruction.

<annot> → model.annotLike → model.textPhraseLike.limited → model.editTransPart.text → model.editTransPart → <restore>

**<role>** Name of a dramatic role, as given in a cast list.

<annot> → model.annotLike → model.textPhraseLike.limited → <role>

**<roleDesc>** Describes a character's role in a drama.

<annot> → model.annotLike → model.textPhraseLike.limited → <roleDesc>

**<roleName>** Contains a name component which indicates that the referent has a particular role or position in society, such as an official title or rank.

<annot> → model.annotLike → model.textPhraseLike.limited → model.textPhraseLike → <roleName>

**<score>** Full score view of the musical content.

<annot> → model.annotLike → <score>

**<scriptDesc>** Contains a description of the letters or characters used in an autographic item.

<annot> → model.annotLike → model.textPhraseLike.limited → <scriptDesc>

**<seal>** A single seal or similar attachment.

<annot> → model.annotLike → model.textPhraseLike.limited → <seal>

**<sealDesc>** Describes the seals or similar external attachments applied to an item.

<annot> → model.annotLike → model.textPhraseLike.limited → <sealDesc>

**<section>** Segment of music data.

<annot> → model.annotLike → <section>

**<seg>** (arbitrary segment) represents any segmentation of text below the "text component" level.

<annot> → model.annotLike → model.textPhraseLike.limited → model.textPhraseLike → <seg>

**<settlement>** Contains the name of a settlement such as a city, town, or village identified as a single geopolitical or administrative unit.

<annot> → model.annotLike → model.textPhraseLike.limited → model.textPhraseLike → <settlement>

**<sic>** Contains apparently incorrect or inaccurate material.

<annot> → model.annotLike → model.textPhraseLike.limited → model.editTransPart.text → model.editTransPart → <sic>

**<signifLet>** Significantive letter(s).

<annot> → model.annotLike → model.textPhraseLike.limited → <signifLet>

**<soundChan>** Reflects the number of apparent sound channels in the playback of a recording (monaural, stereophonic, quadraphonic, etc.).

<annot> → model.annotLike → model.textPhraseLike.limited → <soundChan>

**<sp>** Contains an individual speech in a performance text.

<annot> → model.annotLike → <sp>

**<speaker>** Contains a specialized form of heading or label, giving the name of one or more speakers in a dramatic text or fragment.

<annot> → model.annotLike → model.textPhraseLike.limited → <speaker>

**<sponsor>** Names of sponsoring individuals, organizations or institutions. Sponsors give their intellectual authority to a project; they are to be distinguished from funders, who provide the funding but do not necessarily take intellectual responsibility.

<annot> → model.annotLike → model.textPhraseLike.limited → <sponsor>

**<stack>** An inline table with a single column.

<annot> → model.annotLike → model.textPhraseLike.limited → <stack>

**<staff>** A group of equidistant horizontal lines on which notes are placed in order to represent pitch or a grouping element for individual 'strands' of notes, rests, etc. that may or may not actually be rendered on staff lines; that is, both diastematic and non-diastematic signs.

<annot> → model.annotLike → <staff>

**<stageDir>** Contains any kind of stage direction within a dramatic text or fragment.

<annot> → model.annotLike → model.textPhraseLike.limited → <stageDir>

**<street>** full street address including any name or number identifying a building as well as the name of the street or route on which it is located.

<annot> → model.annotLike → model.textPhraseLike.limited → model.textPhraseLike → <street>

**<styleName>** A label for a characteristic style of writing or performance, such as 'bebop' or 'rock-n-roll'.

<annot> → model.annotLike → model.textPhraseLike.limited → model.textPhraseLike → <styleName>

**<supplied>** Contains material supplied by the transcriber or editor for any reason.

<annot> → model.annotLike → model.textPhraseLike.limited → model.editTransPart.text → model.editTransPart → <supplied>

**<supportDesc>** Groups elements describing the physical support material of an item.

<annot> → model.annotLike → model.textPhraseLike.limited → <supportDesc>

**<syl>** Individual lyric syllable.

<annot> → model.annotLike → model.textPhraseLike.limited → <syl>

**<syllable>** Neume notation can be thought of as "neumed text". Therefore, the syllable element provides high-level organization in this repertoire.

<annot> → model.annotLike → <syllable>

**<symbolDef>** Declaration of an individual symbol in a symbolTable.

<annot> → model.annotLike → <symbolDef>

**<td>** Designates a table cell that contains data as opposed to a cell that contains column or row heading information.

<annot> → model.annotLike → model.textPhraseLike.limited → model.textPhraseLike → <td>

**<tempo>** Text and symbols descriptive of tempo, mood, or style, e.g., "allarg.", "a tempo", "cantabile", "Moderato", "J=60", "Moderato J =60").

<annot> → model.annotLike → model.textPhraseLike.limited → <tempo>

**<term>** Keyword or phrase which describes a resource.

<annot> → model.annotLike → model.textPhraseLike.limited → <term>

**<textLang>** Identifies the languages and writing systems within the work described by a bibliographic description, not the language of the description.

<annot> → model.annotLike → model.textPhraseLike.limited → <textLang>

**<th>** Designates a table cell containing column or row heading information as opposed to one containing data.

<annot> → model.annotLike → model.textPhraseLike.limited → model.textPhraseLike → <th>

**<treatHist>** A record of the treatment the item has undergone (e.g., de-acidification, restoration, etc.).

<annot> → model.annotLike → model.textPhraseLike.limited → <treatHist>

**<treatSched>** Scheduled treatment, e.g., de-acidification, restoration, etc., for an item.

<annot> → model.annotLike → model.textPhraseLike.limited → <treatSched>

**<typeDesc>** Contains a description of the typefaces or other aspects of the printing of a printed source.

<annot> → model.annotLike → model.textPhraseLike.limited → <typeDesc>

**<unclear>** Contains material that cannot be transcribed with certainty because it is illegible or inaudible in the source.

<annot> → model.annotLike → model.textPhraseLike.limited → model.editTransPart.text → model.editTransPart → <unclear>

**<width>** Description of the horizontal size of an object.

<annot> → model.annotLike → model.textPhraseLike.limited → <width>

## May Contain

**<abbr>** A generic element for 1) a shortened form of a word, including an acronym or 2) a shorthand notation.

<annot> → model.textPhraseLike → model.textPhraseLike.limited → model.editorialLike → <abbr>

**<add>** Marks an addition to the text.

<annot> → model.transcriptionLike → <add>

**<address>** Contains a postal address, for example of a publisher, an organization, or an individual.

<annot> → model.textPhraseLike → model.textPhraseLike.limited → model.addressLike → <address>

**<annot>** Provides a statement explaining the text or indicating the basis for an assertion.

<annot> → model.textPhraseLike → model.textPhraseLike.limited → model.annotLike → <annot>

**<bibl>** Provides a loosely-structured bibliographic citation in which the sub-components may or may not be explicitly marked.

<annot> → model.textPhraseLike → model.textPhraseLike.limited → model.biblLike → <bibl>

**<biblList>** List of bibliographic references.

<annot> → model.textComponentLike → model.listLike → <biblList>

**<biblStruct>** Contains a bibliographic citation in which bibliographic sub-elements must appear in a specified order.

<annot> → model.textPhraseLike → model.textPhraseLike.limited → model.biblLike → <biblStruct>

**<bloc>** Contains the name of a geopolitical unit consisting of two or more nation states or countries.

<annot> → model.textPhraseLike → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <bloc>

**<castList>** Contains a single cast list or dramatis personae.

<annot> → model.textComponentLike → model.listLike → <castList>

**<catchwords>** Describes the system used to ensure correct ordering of the quires making up an item, typically by means of annotations at the foot of the page.

<annot> → model.textPhraseLike → model.textPhraseLike.limited → model.msInLine → <catchwords>

**<choice>** Groups a number of alternative encodings for the same point in a text.

<annot> → model.editLike → <choice>

**<corpName>** Identifies an organization or group of people that acts as a single entity.

<annot> → model.textPhraseLike → model.textPhraseLike.limited → model.nameLike → model.nameLike.agent → <corpName>

**<corr>** Contains the correct form of an apparent erroneous passage.

<annot> → model.transcriptionLike → <corr>

**<country>** Contains the name of a geopolitical unit, such as a nation, country, colony, or commonwealth, larger than or administratively superior to a region and smaller than a bloc.

<annot> → model.textPhraseLike → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <country>

**<damage>** Contains an area of damage to the physical medium.

<annot> → model.transcriptionLike → <damage>

**<date>** A string identifying a point in time or the time period between two such points.

<annot> → model.textPhraseLike → model.textPhraseLike.limited → model.dateLike → <date>

**<dedicatee>** Entity to whom a creative work is formally offered.

<annot> → model.textPhraseLike → model.textPhraseLike.limited → <dedicatee>

**<del>** Contains information deleted, marked as deleted, or otherwise indicated as superfluous or spurious in the copy text by an author, scribe, annotator, or corrector.

<annot> → model.transcriptionLike → <del>

**<depth>** Description of a measurement taken through a three-dimensional object.

<annot> → model.textPhraseLike → model.textPhraseLike.limited → model.dimLike → <depth>

**<dim>** Any single dimensional specification.

<annot> → model.textPhraseLike → model.textPhraseLike.limited → model.dimLike → <dim>

**<dimensions>** Information about the physical size of an entity; usually includes numerical data.

<annot> → model.textPhraseLike → model.textPhraseLike.limited → <dimensions>

**<district>** Contains the name of any kind of subdivision of a settlement, such as a parish, ward, or other administrative or geographic unit.

<annot> → model.textPhraseLike → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <district>

**<eventList>** Contains historical information given as a sequence of significant past events.

<annot> → model.textComponentLike → model.listLike → <eventList>

**<expan>** Contains the expansion of an abbreviation.

<annot> → model.textPhraseLike → model.textPhraseLike.limited → model.editorialLike → <expan>

**<extent>** Used to express size in terms other than physical dimensions, such as number of pages, records, bytes, physical components, etc.

<annot> → model.textPhraseLike → model.textPhraseLike.limited → <extent>

**<fig>** Groups elements representing or containing graphic information such as an illustration or figure.

<annot> → model.textPhraseLike → model.textPhraseLike.limited → model.figureLike → <fig>

**<gap>** Indicates a point where material has been omitted in a transcription, whether as part of sampling practice or for editorial reasons described in the MEI header.

<annot> → model.transcriptionLike → <gap>

**<geogFeat>** Contains a common noun identifying a geographical feature.

<annot> → model.textPhraseLike → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <geogFeat>

**<geogName>** The proper noun designation for a place, natural feature, or political jurisdiction.

<annot> → model.textPhraseLike → model.textPhraseLike.limited → model.nameLike → model.nameLike.place → model.nameLike.geogName → <geogName>

**<handShift>** Marks the beginning of a passage written in a new hand, or of a change in the scribe, writing style, ink or character of the document hand.

<annot> → model.transcriptionLike → <handShift>

**<head>** Contains any heading, for example, the title of a section of text, or the heading of a list.

<annot> → model.headLike → <head>

**<height>** Description of the vertical size of an object.

<annot> → model.textPhraseLike → model.textPhraseLike.limited → model.dimLike → <height>

**<heraldry>** Contains a heraldic formula or phrase, typically found as part of a blazon, coat of arms, etc.

<annot> → model.textPhraseLike → model.textPhraseLike.limited → model.mslInline → <heraldry>

**<identifier>** An alpha-numeric string that establishes the identity of the described material.

<annot> → model.textPhraseLike → model.textPhraseLike.limited → model.identifierLike → <identifier>

**<lb>** An empty formatting element that forces text to begin on a new line.

<annot> → model.textPhraseLike → model.textPhraseLike.limited → model.lblLike → <lb>

**<lg>** May be used for any section of text that is organized as a group of lines; however, it is most often used for a group of verse lines functioning as a formal unit, e.g., a stanza, refrain, verse paragraph, etc.

<annot> → model.textComponentLike → model.lgLike → <lg>

**<list>** A formatting element that contains a series of items separated from one another and arranged in a linear, often vertical, sequence.

<annot> → model.textComponentLike → model.listLike → <list>

**<locus>** Defines a location within a manuscript or manuscript component, usually as a (possibly discontinuous) sequence of folio references.

<annot> → model.textPhraseLike → model.textPhraseLike.limited → model.msInLine → <locus>

**<locusGrp>** Groups locations which together form a distinct but discontinuous item within a manuscript or manuscript part, according to a specific foliation.

<annot> → model.textPhraseLike → model.textPhraseLike.limited → model.msInLine → <locusGrp>

**<name>** Proper noun or noun phrase.

<annot> → model.textPhraseLike → model.textPhraseLike.limited → model.nameLike → <name>

**<num>** Numeric information in any form.

<annot> → model.textPhraseLike → model.textPhraseLike.limited → model.measurementLike → model.numLike → <num>

**<orig>** Contains material which is marked as following the original, rather than being normalized or corrected.

<annot> → model.transcriptionLike → <orig>

**<p>** One or more text phrases that form a logical prose passage.

<annot> → model.textComponentLike → model.pLike → <p>

**<pb>** An empty formatting element that forces text to begin on a new page.

<annot> → model.textPhraseLike → model.pbLike → <pb>

**<periodName>** A label that describes a period of time, such as 'Baroque' or '3rd Style period'.

<annot> → model.textPhraseLike → model.textPhraseLike.limited → model.nameLike.label → <periodName>

**<persName>** Designation for an individual, including any or all of that individual's forenames, surnames, honorific titles, and added names.

<annot> → model.textPhraseLike → model.textPhraseLike.limited → model.nameLike → model.nameLike.agent → <persName>

**<postBox>** (postal box or post office box) contains a number or other identifier for some postal delivery point other than a street address.

<annot> → model.textPhraseLike → model.textPhraseLike.limited → model.addressPart → <postBox>

**<postCode>** (postal code) contains a numerical or alphanumeric code used as part of a postal address to simplify sorting or delivery of mail.

<annot> → model.textPhraseLike → model.textPhraseLike.limited → model.addressPart → <postCode>

**<ptr>** Defines a traversible pointer to another location, using only attributes to describe the destination.

<annot> → model.textPhraseLike → model.textPhraseLike.limited → model.locrefLike → <ptr>

**<q>** Contains material which is distinguished from the surrounding phrase-level text using quotation marks or a similar method. Use <quote> for block-level quotations.

<annot> → model.textPhraseLike → model.textPhraseLike.limited → model.qLike → <q>

**<quote>** Contains a paragraph-like block of text attributed to an external source, normally set off from the surrounding text by spacing or other typographic distinction.

<annot> → model.textComponentLike → model.quoteLike → <quote>

**<ref>** Defines a traversible reference to another location. May contain text and sub-elements that describe the destination.

<annot> → model.textPhraseLike → model.textPhraseLike.limited → model.locrefLike → <ref>

**<reg>** Contains material which has been regularized or normalized in some sense.

<annot> → model.transcriptionLike → <reg>

**<region>** Contains the name of an administrative unit such as a state, province, or county, larger than a settlement, but smaller than a country.

<annot> → model.textPhraseLike → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <region>

**<relation>** Describes a relationship or linkage amongst entities.

<annot> → model.textPhraseLike → model.textPhraseLike.limited → model.relationLike → <relation>

**<relationList>** Gathers relation elements.

<annot> → model.textPhraseLike → model.textPhraseLike.limited → model.relationLike → <relationList>

**<rend>** A formatting element indicating special visual rendering, e.g., bold or italicized, of a text word or phrase.

<annot> → model.textPhraseLike → model.textPhraseLike.limited → model.rendLike → <rend>

**<repository>** Institution, agency, or individual which holds a bibliographic item.

<annot> → model.textPhraseLike → model.textPhraseLike.limited → model.nameLike → model.nameLike.place → model.repositoryLike → <repository>

**<restore>** Indicates restoration of material to an earlier state by cancellation of an editorial or authorial marking or instruction.

<annot> → model.transcriptionLike → <restore>

**<secFolio>** Marks the word or words taken from a fixed point in a codex (typically the beginning of the second leaf) in order to provide a unique identifier for the item.

<annot> → model.textPhraseLike → model.textPhraseLike.limited → model.msInline → <secFolio>

**<seg>** (arbitrary segment) represents any segmentation of text below the "text component" level.

<annot> → model.textPhraseLike → model.textPhraseLike.limited → <seg>

**<settlement>** Contains the name of a settlement such as a city, town, or village identified as a single geopolitical or administrative unit.

<annot> → model.textPhraseLike → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <settlement>

**<sic>** Contains apparently incorrect or inaccurate material.

<annot> → model.transcriptionLike → <sic>

**<signatures>** Provides a description of the leaf or quire signatures found within a codex.

<annot> → model.textPhraseLike → model.textPhraseLike.limited → model.msInline → <signatures>

**<stack>** An inline table with a single column.

<annot> → model.textPhraseLike → model.textPhraseLike.limited → model.rendLike → <stack>

**<stamp>** Contains a word or phrase describing an official mark indicating ownership, genuineness, validity, etc.

<annot> → model.textPhraseLike → model.textPhraseLike.limited → model.msInline → <stamp>

**<street>** full street address including any name or number identifying a building as well as the name of the street or route on which it is located.

<annot> → model.textPhraseLike → model.textPhraseLike.limited → model.addressPart → <street>

**<styleName>** A label for a characteristic style of writing or performance, such as 'bebop' or 'rock-n-roll'.

<annot> → model.textPhraseLike → model.textPhraseLike.limited → model.nameLike.label → <styleName>

**<subst>** Groups transcriptional elements when the combination is to be regarded as a single intervention in the text.

<annot> → model.editLike → <subst>

**<supplied>** Contains material supplied by the transcriber or editor for any reason.

<annot> → model.transcriptionLike → <supplied>

**<symbol>** A reference to a previously defined symbol.

<annot> → model.textPhraseLike → model.textPhraseLike.limited → <symbol>

**<table>** Contains text displayed in tabular form.

<annot> → model.textComponentLike → model.tableLike → <table>

**<term>** Keyword or phrase which describes a resource.

<annot> → model.textPhraseLike → model.textPhraseLike.limited → <term>

**<title>** Title of a bibliographic entity.

<annot> → model.textPhraseLike → model.textPhraseLike.limited → model.titleLike → <title>

**<unclear>** Contains material that cannot be transcribed with certainty because it is illegible or inaudible in the source.

<annot> → model.transcriptionLike → <unclear>

**<watermark>** Contains a description of a watermark or similar device.

<annot> → model.textPhraseLike → model.textPhraseLike.limited → model.mslnline → <watermark>

**<width>** Description of the horizontal size of an object.

<annot> → model.textPhraseLike → model.textPhraseLike.limited → model.dimLike → <width>

## Remarks

The **<annot>** element can be used for both general comments and for annotations of the musical text. It provides a way to group participating \*events\* and/or \*control events\*, for example, the notes that form a descending bass line, and provide a label for and comment regarding the group. Participating entities may be identified in the plist attribute. An editorial or analytical comment or observation may be included directly within the **<annot>** element. The starting point of the annotation may be indicated by either a tstamp, tstamp.ges, tstamp.real or startid attribute, while the ending point may be recorded by either a dur, dur.ges or endid attribute. The resp attribute records the editor(s) responsible for identifying or creating the annotation.

## Constraints

The @data attribute may only occur on an annotation within the notesStmt element.

## Declaration

```

### Attributes

**@class** (*optional*) Contains one or more URIs which denote classification terms that apply to the entity bearing this attribute. One or more values from [data.URI](#), separated by spaces.

<app> → att.common → att.typed → att.classed → @class

**@copyof** (*optional*) Points to an element of which the current element is a copy. Value conforms to [data.URI](#).

<app> → att.common → att.linked → @copyof

**@corresp** (*optional*) Used to point to other elements that correspond to this one in a generic fashion. One or more values from [data.URI](#), separated by spaces.

<app> → att.common → att.linked → @corresp

**@follows** (*optional*) points to one or more events in a user-defined collection that are known to be predecessors of the current element. One or more values from [data.URI](#), separated by spaces.

<app> → att.common → att.linked → @follows

**@label** (*optional*) Captures text to be used to generate a label for the element to which it's attached, a "tool tip" or prefatory text, for example. Should not be used to record document content. Value is plain text.

<app> → att.common → att.labelled → @label

**@n** (*optional*) Provides a number-like designation that indicates an element's position in a sequence of similar elements. May not contain space characters. Value conforms to [data.WORD](#).

<app> → att.common → att.nNumberLike → @n

**@next** (*optional*) Used to point to the next event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<app> → att.common → att.linked → @next

**@precedes** (*optional*) Points to one or more events in a user-defined collection that are known to be successors of the current element. One or more values from [data.URI](#), separated by spaces.

<app> → att.common → att.linked → @precedes

**@prev** (*optional*) Points to the previous event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<app> → att.common → att.linked → @prev

**@resp** (*optional*) Indicates the agent(s) responsible for some aspect of the text's transcription, editing, or encoding. Its value must point to one or more identifiers declared in the document header. One or more values from [data.URI](#), separated by spaces.

<app> → att.common → att.responsibility → @resp

**@sameas** (*optional*) Points to an element that is the same as the current element but is not a literal copy of the current element. One or more values from [data.URI](#), separated by spaces.

<app> → att.common → att.linkng → @sameas

**@synch** (*optional*) Points to elements that are synchronous with the current element. One or more values from [data.URI](#), separated by spaces.

<app> → att.common → att.linkng → @synch

**@type** (*optional*) Designation which characterizes the element in some sense, using any convenient classification scheme or typology that employs single-token labels. One or more values of datatype **NMTOKEN**, separated by spaces.

<app> → att.common → att.typed → @type

**@xml:base** (*optional*) Provides a base URI reference with which applications can resolve relative URI references into absolute URI references. Value conforms to [data.URI](#).

<app> → att.common → att.basic → @xml:base

**@xml:id** (*optional*) Regularizes the naming of an element and thus facilitates building links between it and other resources. Each id attribute within a document must have a unique value. Value is a valid [xml:id](#).

<app> → att.common → att.basic → att.id → @xml:id

## Member of

[model.appLike](#) Groups elements that contain a critical apparatus entry.

## Contained By

**<beam>** A container for a series of explicitly beamed events that begins and ends entirely within a measure.

<app> → model.appLike → <beam>

**<chord>** A simultaneous sounding of two or more notes in the same layer \*with the same duration\*.

<app> → model.appLike → <chord>

**<ending>** Alternative ending for a repeated passage of music; i.e., prima volta, seconda volta, etc.

<app> → model.appLike → <ending>

**<graceGrp>** A container for a sequence of grace notes.

<app> → model.appLike → <graceGrp>

**<layer>** An independent stream of events on a staff.

<app> → model.appLike → <layer>

**<lem>** (lemma) – Contains the lemma, or base text, of a textual variation.

<app> → model.appLike → <lem>

**<ligature>** A mensural notation symbol that combines two or more notes into a single sign.

<app> → model.appLike → <ligature>

**<measure>** Unit of musical time consisting of a fixed number of note values of a given type, as determined by the prevailing meter, and delimited in musical notation by bar lines.

<app> → model.appLike → <measure>

**<nc>** Sign representing a single pitched event, although the exact pitch may not be known.

<app> → model.appLike → <nc>

**<ncGrp>** Collection of one or more neume components.

<app> → model.appLike → <ncGrp>

**<neume>** Sign representing one or more musical pitches.

<app> → model.appLike → <neume>

**<note>** A single pitched event.

<app> → model.appLike → <note>

**<oLayer>** A layer that contains an alternative to material in another layer.

<app> → model.appLike → <oLayer>

**<oStaff>** A staff that holds an alternative passage which may be played instead of the original material.

<app> → model.appLike → <oStaff>

**<part>** An alternative visual rendition of the score from the point of view of a particular performer (or group of performers).

<app> → model.appLike → <part>

**<pgFoot>** A running footer.

<app> → model.appLike → <pgFoot>

**<pgHead>** A running header.

<app> → model.appLike → <pgHead>

**<rdg>** (reading) – Contains a single reading within a textual variation.

<app> → model.appLike → <rdg>

**<refrain>** Recurring lyrics, especially at the end of each verse or stanza of a poem or song lyrics; a chorus.

<app> → model.appLike → <refrain>

**<rest>** A non-sounding event found in the source being transcribed.

<app> → model.appLike → <rest>

**<score>** Full score view of the musical content.

<app> → model.appLike → <score>

**<section>** Segment of music data.

<app> → model.appLike → <section>

**<sp>** Contains an individual speech in a performance text.

<app> → model.appLike → <sp>

**<staff>** A group of equidistant horizontal lines on which notes are placed in order to represent pitch or a grouping element for individual 'strands' of notes, rests, etc. that may or may not actually be rendered on staff lines; that is, both diastematic and non-diastematic signs.

<app> → model.appLike → <staff>

**<syl>** Individual lyric syllable.

<app> → model.appLike → <syl>

**<syllable>** Neume notation can be thought of as "neumed text". Therefore, the syllable element provides high-level organization in this repertoire.

<app> → model.appLike → <syllable>

**<tuplet>** A group of notes with "irregular" (sometimes called "irrational") rhythmic values, for example, three notes in the time normally occupied by two or nine in the time of five.

<app> → `model.appLike` → <tuplet>

**<verse>** Division of a poem or song lyrics, sometimes having a fixed length, meter or rhyme scheme; a stanza.

<app> → `model.appLike` → <verse>

**<volta>** Sung text for a specific iteration of a repeated section of music.

<app> → `model.appLike` → <volta>

## May Contain

**<lem>** (lemma) – Contains the lemma, or base text, of a textual variation.

<app> → direct children → <lem>

**<rdg>** (reading) – Contains a single reading within a textual variation.

<app> → direct children → <rdg>

## Remarks

The alternatives provided in <lem> and/or <rdg> sub-elements may be thought of as exclusive or as parallel. The type attribute may contain any convenient descriptive word, describing the extent of the variation (e.g., note, phrase, measure, etc.), its text-critical significance (e.g., significant, accidental, unclear), or the nature of the variation or the principles required to understand it (e.g., lectio difficilior, usus auctoris, etc.).

The model of this element is based on the `app` element of the Text Encoding Initiative (TEI).

### 3.4.2.1 Application Information

## Module

[MEI.header](#)

## Attributes

**@class** (*optional*) Contains one or more URIs which denote classification terms that apply to the entity bearing this attribute. One or more values from [data.URI](#), separated by spaces.

<application> → att.common → att.typed → att.classed → @class

**@copyof** (*optional*) Points to an element of which the current element is a copy. Value conforms to [data.URI](#).

<application> → att.common → att.linked → @copyof

**@corresp** (*optional*) Used to point to other elements that correspond to this one in a generic fashion. One or more values from [data.URI](#), separated by spaces.

<application> → att.common → att.linked → @corresp

**@enddate** (*optional*) Contains the end point of a date range in standard ISO form. Value conforms to [data.ISODATE](#).

<application> → att.datable → @enddate

**@follows** (*optional*) points to one or more events in a user-defined collection that are known to be predecessors of the current element. One or more values from [data.URI](#), separated by spaces.

<application> → att.common → att.linked → @follows

**@isodate** (*optional*) Provides the value of a textual date in standard ISO form. Value conforms to [data.ISODATE](#).

<application> → att.datable → @isodate

**@label** (*optional*) Captures text to be used to generate a label for the element to which it's attached, a "tool tip" or prefatory text, for example. Should not be used to record document content. Value is plain text.

<application> → att.common → att.labelled → @label

**@n** (*optional*) Provides a number-like designation that indicates an element's position in a sequence of similar elements. May not contain space characters. Value conforms to [data.WORD](#).

<application> → att.common → att.nNumberLike → @n

**@next** (*optional*) Used to point to the next event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<application> → att.common → att.linked → @next

**@notafter** (*optional*) Contains an upper boundary for an uncertain date in standard ISO form. Value conforms to [data.ISODATE](#).

<application> → att.datable → @notafter

**@notbefore** (*optional*) Contains a lower boundary, in standard ISO form, for an uncertain date. Value conforms to [data.ISODATE](#).

<application> → att.datable → @notbefore

**@precedes** (*optional*) Points to one or more events in a user-defined collection that are known to be successors of the current element. One or more values from [data.URI](#), separated by spaces.

<application> → att.common → att.linking → @precedes

**@prev** (*optional*) Points to the previous event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<application> → att.common → att.linking → @prev

**@resp** (*optional*) Indicates the agent(s) responsible for some aspect of the text's transcription, editing, or encoding. Its value must point to one or more identifiers declared in the document header. One or more values from [data.URI](#), separated by spaces.

<application> → att.common → att.responsibility → @resp

**@sameas** (*optional*) Points to an element that is the same as the current element but is not a literal copy of the current element. One or more values from [data.URI](#), separated by spaces.

<application> → att.common → att.linking → @sameas

**@startdate** (*optional*) Contains the starting point of a date range in standard ISO form. Value conforms to [data.ISODATE](#).

<application> → att.datable → @startdate

**@synch** (*optional*) Points to elements that are synchronous with the current element. One or more values from [data.URI](#), separated by spaces.

<application> → att.common → att.linking → @synch

**@type** (*optional*) Designation which characterizes the element in some sense, using any convenient classification scheme or typology that employs single-token labels. One or more values of datatype **NMTOKEN**, separated by spaces.

<application> → att.common → att.typed → @type

**@version** (*optional*) Supplies a version number for an application, independent of its identifier or display name. Value is a **NMTOKEN**.

<application> → direct children → @version

**@xml:base** (*optional*) Provides a base URI reference with which applications can resolve relative URI references into absolute URI references. Value conforms to [data.URI](#).

<application> → att.common → att.basic → @xml:base

**@xml:id** (*optional*) Regularizes the naming of an element and thus facilitates building links between it and other resources. Each id attribute within a document must have a unique value. Value is a valid [xml:id](#).

<application> → att.common → att.basic → att.id → @xml:id

## Member of

(application isn't member of any model class)

## Contained By

**<applInfo>** Groups information about applications which have acted upon the MEI file.

<application> → elements having application as direct children → <applInfo>

## May Contain

**<name>** Proper noun or noun phrase.

<application> → direct children → <name>

**<p>** One or more text phrases that form a logical prose passage.

<application> → model.pLike → <p>

**<ptr>** Defines a traversible pointer to another location, using only attributes to describe the destination.

<application> → model.locrefLike → <ptr>

**<ref>** Defines a traversible reference to another location. May contain text and sub-elements that describe the destination.

<application> → model.locrefLike → <ref>

## Remarks

The model of this element is based on the [application](#) element of the Text Encoding Initiative (TEI).

### Module

[MEI.text](#)

### Attributes

**@class** (*optional*) Contains one or more URIs which denote classification terms that apply to the entity bearing this attribute. One or more values from [data.URI](#), separated by spaces.

<argument> → att.common → att.typed → att.classed → @class

**@copyof** (*optional*) Points to an element of which the current element is a copy. Value conforms to [data.URI](#).

<argument> → att.common → att.linking → @copyof

**@corresp** (*optional*) Used to point to other elements that correspond to this one in a generic fashion. One or more values from [data.URI](#), separated by spaces.

<argument> → att.common → att.linking → @corresp

**@decls** (*optional*) Identifies one or more metadata elements (other than classification terms) within the header, which are understood to apply to the element bearing this attribute and its content. One or more values from [data.URI](#), separated by spaces.

<argument> → att.metadataPointing → @decls

**@facsimile** (*optional*) Points to one or more images, portions of an image, or surfaces which correspond to the current element. One or more values from [data.URI](#), separated by spaces.

<argument> → att.facsimile → @facsimile

**@follows** (*optional*) points to one or more events in a user-defined collection that are known to be predecessors of the current element. One or more values from [data.URI](#), separated by spaces.

<argument> → att.common → att.linking → @follows

**@label** (*optional*) Captures text to be used to generate a label for the element to which it's attached, a "tool tip" or prefatory text, for example. Should not be used to record document content. Value is plain text.

<argument> → att.common → att.labelled → @label

**@n** (*optional*) Provides a number-like designation that indicates an element's position in a sequence of similar elements. May not contain space characters. Value conforms to [data.WORD](#).

<argument> → att.common → att.nNumberLike → @n

**@next** (*optional*) Used to point to the next event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<argument> → att.common → att.linking → @next

**@precedes** (*optional*) Points to one or more events in a user-defined collection that are known to be successors of the current element. One or more values from [data.URI](#), separated by spaces.

<argument> → att.common → att.linking → @precedes

**@prev** (*optional*) Points to the previous event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<argument> → att.common → att.linking → @prev

**@resp** (*optional*) Indicates the agent(s) responsible for some aspect of the text's transcription, editing, or encoding. Its value must point to one or more identifiers declared in the document header. One or more values from [data.URI](#), separated by spaces.

<argument> → [att.common](#) → [att.responsibility](#) → @resp

**@sameas** (*optional*) Points to an element that is the same as the current element but is not a literal copy of the current element. One or more values from [data.URI](#), separated by spaces.

<argument> → [att.common](#) → [att.linkin](#) → @sameas

**@synch** (*optional*) Points to elements that are synchronous with the current element. One or more values from [data.URI](#), separated by spaces.

<argument> → [att.common](#) → [att.linkin](#) → @synch

**@translit** (*optional*) Specifies the transliteration technique used. Value is a [NMOKEN](#).

<argument> → [att.lang](#) → @translit

**@type** (*optional*) Designation which characterizes the element in some sense, using any convenient classification scheme or typology that employs single-token labels. One or more values of datatype [NMOKEN](#), separated by spaces.

<argument> → [att.common](#) → [att.typed](#) → @type

**@xml:base** (*optional*) Provides a base URI reference with which applications can resolve relative URI references into absolute URI references. Value conforms to [data.URI](#).

<argument> → [att.common](#) → [att.basic](#) → @xml:base

**@xml:id** (*optional*) Regularizes the naming of an element and thus facilitates building links between it and other resources. Each id attribute within a document must have a unique value. Value is a valid [xml:id](#).

<argument> → [att.common](#) → [att.basic](#) → [att.id](#) → @xml:id

**@xml:lang** (*optional*) Identifies the language of the element's content. The values for this attribute are language 'tags' as defined in BCP 47. All language tags that make use of private use sub-tags must be documented in a corresponding language element in the MEI header whose id attribute is the same as the language tag's value. Value is a [language](#).

<argument> → [att.lang](#) → @xml:lang

## Member of

[model.titlePagePart](#) Groups elements that may appear as part of a title page transcription.

## Contained By

[\*\*<titlePage>\*\*](#) Contains a transcription of the title page of a text.

<argument> → [model.titlePagePart](#) → <titlePage>

## May Contain

[\*\*<biblList>\*\*](#) List of bibliographic references.

<argument> → [model.textComponentLike](#) → [model.listLike](#) → <biblList>

[\*\*<castList>\*\*](#) Contains a single cast list or dramatis personae.

<argument> → [model.textComponentLike](#) → [model.listLike](#) → <castList>

[\*\*<cb>\*\*](#) An empty formatting element that forces text to begin in a new column.

<argument> → [model.milestoneLike.text](#) → <cb>

**<colLayout>** An empty formatting element that signals the start of columnar layout.

<argument> → model.milestoneLike.text → <colLayout>

**<eventList>** Contains historical information given as a sequence of significant past events.

<argument> → model.textComponentLike → model.listLike → <eventList>

**<fig>** Groups elements representing or containing graphic information such as an illustration or figure.

<argument> → model.figureLike → <fig>

**<head>** Contains any heading, for example, the title of a section of text, or the heading of a list.

<argument> → model.headLike → <head>

**<lb>** An empty formatting element that forces text to begin on a new line.

<argument> → model.milestoneLike.text → model.lbLike → <lb>

**<lg>** May be used for any section of text that is organized as a group of lines; however, it is most often used for a group of verse lines functioning as a formal unit, e.g., a stanza, refrain, verse paragraph, etc.

<argument> → model.textComponentLike → model.lgLike → <lg>

**<list>** A formatting element that contains a series of items separated from one another and arranged in a linear, often vertical, sequence.

<argument> → model.textComponentLike → model.listLike → <list>

**<p>** One or more text phrases that form a logical prose passage.

<argument> → model.textComponentLike → model.pLike → <p>

**<pb>** An empty formatting element that forces text to begin on a new page.

<argument> → model.milestoneLike.text → model.pbLike → <pb>

**<quote>** Contains a paragraph-like block of text attributed to an external source, normally set off from the surrounding text by spacing or other typographic distinction.

<argument> → model.textComponentLike → model.quoteLike → <quote>

**<sp>** Contains an individual speech in a performance text.

<argument> → direct children → <sp>

**<table>** Contains text displayed in tabular form.

<argument> → model.textComponentLike → model.tableLike → <table>

## Remarks

The model of this element is based on the [argument](#) element of the Text Encoding Initiative (TEI).

## <arpeg>

(arpeggiation) – Indicates that the notes of a chord are to be performed successively rather than simultaneously, usually from lowest to highest. Sometimes called a "roll".

### Referenced in chapters

[4.3.5 Articulation and Performance Instructions in CMN](#), [4.3.5.1 Arpeggio and Glissando](#)

### Module

[MEI.cmn](#)

### Attributes

**@altsym** (*optional*) Provides a way of pointing to a user-defined symbol. It must contain a reference to an ID of a [<symbolDef>](#) element elsewhere in the document. Value conforms to [data.URI](#).

<arpeg> → att.arpeg.vis → att.altsym → @altsym

**@arrow** (*optional*) Indicates if an arrowhead is to be drawn as part of the arpeggiation symbol. Value conforms to [data.BOOLEAN](#).

<arpeg> → att.arpeg.vis → @arrow

**@arrow.color** (*optional*) Captures the overall color of the arrow. Value conforms to [data.COLOR](#).

<arpeg> → att.arpeg.vis → @arrow.color

**@arrow.fillcolor** (*optional*) Captures the fill color of the arrow if different from the line color. Value conforms to [data.COLOR](#).

<arpeg> → att.arpeg.vis → @arrow.fillcolor

**@arrow.shape** (*optional*) Symbol rendered at end of the line. Value conforms to [data.LINESTARTENDSYMBOL](#).

<arpeg> → att.arpeg.vis → @arrow.shape

**@arrow.size** (*optional*) Holds the relative size of the arrow symbol. Value conforms to [data.FONTSCALE](#).

<arpeg> → att.arpeg.vis → @arrow.size

**@class** (*optional*) Contains one or more URIs which denote classification terms that apply to the entity bearing this attribute. One or more values from [data.URI](#), separated by spaces.

<arpeg> → att.common → att.typed → att.classed → @class

**@color** (*optional*) Used to indicate visual appearance. Do not confuse this with the musical term 'color' as used in pre-CMN notation. Value conforms to [data.COLOR](#).

<arpeg> → att.arpeg.vis → att.color → @color

**@copyof** (*optional*) Points to an element of which the current element is a copy. Value conforms to [data.URI](#).

<arpeg> → att.common → att.linking → @copyof

**@corresp** (*optional*) Used to point to other elements that correspond to this one in a generic fashion. One or more values from [data.URI](#), separated by spaces.

<arpeg> → att.common → att.linking → @corresp

**@enclose** (*optional*) Records the characters often used to mark accidentals, articulations, and sometimes notes as having a cautionary or editorial function. For an example of cautionary accidentals enclosed in parentheses, see Read, p. 131, ex. 9-14. Value conforms to [data.ENCLOSURE](#).

<arpeg> → att.arpeg.vis → att.enclosingChars → @enclose

**@evaluate** (*optional*) Specifies the intended meaning when a participant in a relationship is itself a pointer. Allowed values are: "**all**" (*If an element pointed to is itself a pointer, then the target of that pointer will be taken, and so on, until an element is found which is not a pointer.*), "**one**" (*If an element pointed to is itself a pointer, then its target (whether a pointer or not) is taken as the target of this pointer.*), "**none**" (*No further evaluation of targets is carried out beyond that needed to find the element(s) specified in plist or target attribute.*)

<arpeg> → att.arpeg.log → att.controlEvent → att.targetEval → @evaluate

**@facsimile** (*optional*) Points to one or more images, portions of an image, or surfaces which correspond to the current element. One or more values from [data.URI](#), separated by spaces.

<arpeg> → att.facsimile → @facsimile

**@follows** (*optional*) points to one or more events in a user-defined collection that are known to be predecessors of the current element. One or more values from [data.URI](#), separated by spaces.

<arpeg> → att.common → att.linked → @follows

**@fontfamily** (*optional*) Contains the name of a font-family. Value conforms to [data.FONTFAMILY](#).

<arpeg> → att.arpeg.vis → att.typography → @fontfamily

**@fontname** (*optional*) Holds the name of a font. Value conforms to [data.FONTNAME](#).

<arpeg> → att.arpeg.vis → att.typography → @fontname

**@fontsize** (*optional*) Indicates the size of a font expressed in printers' points, i.e., 1/72nd of an inch, relative terms, e.g., small, larger, etc., or percentage values relative to normal size, e.g., 125%. Value conforms to [data.FONTSIZE](#).

<arpeg> → att.arpeg.vis → att.typography → @fontsize

**@fontstyle** (*optional*) Records the style of a font, i.e., italic, oblique, or normal. Value conforms to [data.FONTSTYLE](#).

<arpeg> → att.arpeg.vis → att.typography → @fontstyle

**@fontweight** (*optional*) Used to indicate bold type. Value conforms to [data.FONTWEIGHT](#).

<arpeg> → att.arpeg.vis → att.typography → @fontweight

**@glyph.auth** (*optional*) A name or label associated with the controlled vocabulary from which the value of `glyph.name` or `glyph.num` is taken, or the textual content of the element. Allowed values are: "**smufl**" (*Standard Music Font Layout*.)

<arpeg> → att.arpeg.vis → att.extSym → att.extSym.auth → @glyph.auth

**@glyph.name** (*optional*) Glyph name. Value is plain text.

<arpeg> → att.arpeg.vis → att.extSym → att.extSym.names → @glyph.name

**@glyph.num** (*optional*) Numeric glyph reference in hexadecimal notation, e.g., "#xE000" or "U+E000".

N.B. SMuFL version 1.18 uses the range U+E000 - U+ECBF. Value conforms to [data.HEXNUM](#).

<arpeg> → att.arpeg.vis → att.extSym → att.extSym.names → @glyph.num

**@glyph.uri** (*optional*) The web-accessible location of the controlled vocabulary from which the value of `glyph.name` or `glyph.num` is taken, or the textual content of the element. Value conforms to [data.URI](#).

<arpeg> → att.arpeg.vis → att.extSym → att.extSym.auth → @glyph.uri

**@ho** (*optional*) Records a horizontal adjustment to a feature's programmatically-determined location in terms of staff interline distance; that is, in units of 1/2 the distance between adjacent staff lines. Value conforms to [data.MEASUREMENTSIGNED](#).

<arpeg> → [att.arpeg.vis](#) → [att.visualOffset](#) → [att.visualOffset.ho](#) → @ho

**@label** (*optional*) Captures text to be used to generate a label for the element to which it's attached, a "tool tip" or prefatory text, for example. Should not be used to record document content. Value is plain text.

<arpeg> → [att.common](#) → [att.labelled](#) → @label

**@layer** (*optional*) Identifies the layer to which a feature applies. One or more values of datatype **positiveInteger**, separated by spaces.

<arpeg> → [att.arpeg.log](#) → [att.controlEvent](#) → [att.layerIdent](#) → @layer

**@letterspacing** (*optional*) Indicates letter spacing (aka tracking) in analogy to the CSS letter-spacing property. Value conforms to [data.MEASUREMENTTYPOGRAPHYSIGNED](#).

<arpeg> → [att.arpeg.vis](#) → [att.typography](#) → @letterspacing

**@line.form** (*optional*) Visual form of the line. Value conforms to [data.LINEFORM](#).

<arpeg> → [att.arpeg.vis](#) → @line.form

**@line.width** (*optional*) Width of the line. Value conforms to [data.LINEWIDTH](#).

<arpeg> → [att.arpeg.vis](#) → @line.width

**@lineheight** (*optional*) Indicates line height in analogy to the CSS line-height property. Value conforms to either [data.MEASUREMENTTYPOGRAPHYUNSIGNED](#) or [data.PERCENT](#).

<arpeg> → [att.arpeg.vis](#) → [att.typography](#) → @lineheight

**@n** (*optional*) Provides a number-like designation that indicates an element's position in a sequence of similar elements. May not contain space characters. Value conforms to [data.WORD](#).

<arpeg> → [att.common](#) → [att.nNumberLike](#) → @n

**@next** (*optional*) Used to point to the next event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<arpeg> → [att.common](#) → [att.linked](#) → @next

**@order** (*optional*) Describes the direction in which an arpeggio is to be performed. Allowed values are: "**up**" (*Lowest to highest pitch.*), "**down**" (*Highest to lowest pitch.*), "**nonarp**" (*Non-arpeggiated style (usually rendered with a preceding bracket instead of a wavy line).*)

<arpeg> → [att.arpeg.log](#) → @order

**@part** (*optional*) Indicates the part in which the current feature should appear. Use '%all' when the feature should occur in every part. One or more values of datatype **a string matching the following regular expression: "(%all|#[\n\r][\c]+)"**, separated by spaces.

<arpeg> → [att.arpeg.log](#) → [att.controlEvent](#) → [att.partIdent](#) → @part

**@partstaff** (*optional*) Signifies the part staff on which a notated feature occurs. Use '%all' when the feature should occur on every staff. One or more values of datatype **a string matching the following regular expression: "(%all|\d+(-\d+)?)"**, separated by spaces.

<arpeg> → [att.arpeg.log](#) → [att.controlEvent](#) → [att.partIdent](#) → @partstaff

**@plist** (*optional*) When the target attribute is present, plist identifies the active participants; that is, those entities pointed "from", in a relationship with the specified target(s). When the target attribute is not present, it identifies participants in a mutual relationship. One or more values from [data.URI](#), separated by spaces.

<arpeg> → att.arpeg.log → att.controlEvent → att.plist → @plist

**@precedes** (*optional*) Points to one or more events in a user-defined collection that are known to be successors of the current element. One or more values from [data.URI](#), separated by spaces.

<arpeg> → att.common → att.linked → @precedes

**@prev** (*optional*) Points to the previous event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<arpeg> → att.common → att.linked → @prev

**@resp** (*optional*) Indicates the agent(s) responsible for some aspect of the text's transcription, editing, or encoding. Its value must point to one or more identifiers declared in the document header. One or more values from [data.URI](#), separated by spaces.

<arpeg> → att.common → att.responsibility → @resp

**@sameas** (*optional*) Points to an element that is the same as the current element but is not a literal copy of the current element. One or more values from [data.URI](#), separated by spaces.

<arpeg> → att.common → att.linked → @sameas

**@staff** (*recommended*) Signifies the staff on which a notated event occurs or to which a control event applies. Mandatory when applicable. One or more values of datatype **positiveInteger**, separated by spaces.

<arpeg> → att.arpeg.log → att.controlEvent → att.staffId → @staff

**@startid** (*optional*) Holds a reference to the first element in a sequence of events to which the feature applies. Value conforms to [data.URI](#).

<arpeg> → att.arpeg.log → att.startId → @startid

**@synch** (*optional*) Points to elements that are synchronous with the current element. One or more values from [data.URI](#), separated by spaces.

<arpeg> → att.common → att.linked → @synch

**@to** (*optional*) Records a timestamp adjustment of a feature's programmatically-determined location in terms of musical time; that is, beats. Value conforms to [data.TSTAMPOFFSET](#).

<arpeg> → att.arpeg.vis → att.visualOffset → att.visualOffset.to → @to

**@tstamp** (*optional*) Encodes the onset time in terms of musical time, i.e., beats[.fractional beat part], as expressed in the written time signature. Value conforms to [data.BEAT](#).

<arpeg> → att.arpeg.log → att.controlEvent → att.timestamp.log → @tstamp

**@tstamp.ges** (*optional*) Encodes the onset time in terms of musical time, i.e., beats[.fractional beat part], as expressed in the written time signature. Value conforms to [data.BEAT](#).

<arpeg> → att.arpeg.log → att.controlEvent → att.timestamp.ges → @tstamp.ges

**@tstamp.real** (*optional*) Records the onset time in terms of ISO time. Value conforms to [data.ISOTIME](#).

<arpeg> → att.arpeg.log → att.controlEvent → att.timestamp.ges → @tstamp.real

**@type** (*optional*) Designation which characterizes the element in some sense, using any convenient classification scheme or typology that employs single-token labels. One or more values of datatype **NMTOKEN**, separated by spaces.

<arpeg> → att.common → att.typed → @type

**@vo** (*optional*) Records the vertical adjustment of a feature's programmatically-determined location in terms of staff interline distance; that is, in units of 1/2 the distance between adjacent staff lines. Value conforms to data.MEASUREMENTSIGNED.

<arpeg> → att.arpeg.vis → att.visualOffset → att.visualOffset.vo → @vo

**@when** (*optional*) Indicates the point of occurrence of this feature along a time line. Its value must be the ID of a <when> element elsewhere in the document. Value conforms to data.URI.

<arpeg> → att.arpeg.log → att.controlEvent → att.alignment → @when

**@x** (*optional*) Encodes an x coordinate for a feature in an output coordinate system. When it is necessary to record the placement of a feature in a facsimile image, use the facets attribute. Value is a decimal number.

<arpeg> → att.arpeg.vis → att.xy → @x

**@xml:base** (*optional*) Provides a base URI reference with which applications can resolve relative URI references into absolute URI references. Value conforms to data.URI.

<arpeg> → att.common → att.basic → @xml:base

**@xml:id** (*optional*) Regularizes the naming of an element and thus facilitates building links between it and other resources. Each id attribute within a document must have a unique value. Value is a valid xml:id.

<arpeg> → att.common → att.basic → att.id → @xml:id

**@y** (*optional*) Encodes a y coordinate for a feature in an output coordinate system. When it is necessary to record the placement of a feature in a facsimile image, use the facets attribute. Value is a decimal number.

<arpeg> → att.arpeg.vis → att.xy → @y

## Member of

[model.controlEventLike.cmn](#) Groups control events that appear in CMN.

## Contained By

**<abbr>** A generic element for 1) a shortened form of a word, including an acronym or 2) a shorthand notation.

<arpeg> → model.controlEventLike.cmn → model.editTransPart.music → model.editTransPart → <abbr>

**<add>** Marks an addition to the text.

<arpeg> → model.controlEventLike.cmn → model.editTransPart.music → model.editTransPart → <add>

**<corr>** Contains the correct form of an apparent erroneous passage.

<arpeg> → model.controlEventLike.cmn → model.editTransPart.music → model.editTransPart → <corr>

**<damage>** Contains an area of damage to the physical medium.

<arpeg> → model.controlEventLike.cmn → model.editTransPart.music → model.editTransPart → <damage>

**<del>** Contains information deleted, marked as deleted, or otherwise indicated as superfluous or spurious in the copy text by an author, scribe, annotator, or corrector.

<arpeg> → model.controlEventLike.cmn → model.editTransPart.music → model.editTransPart → <del>

**<expan>** Contains the expansion of an abbreviation.

<arpeg> → model.controlEventLike.cmn → model.editTransPart.music → model.editTransPart → <expan>

**<lem>** (lemma) – Contains the lemma, or base text, of a textual variation.

<arpeg> → model.controlEventLike.cmn → model.rdgPart.music → model.rdgPart → <lem>

**<measure>** Unit of musical time consisting of a fixed number of note values of a given type, as determined by the prevailing meter, and delimited in musical notation by bar lines.

<arpeg> → model.controlEventLike.cmn → model.measurePart → <measure>

**<orig>** Contains material which is marked as following the original, rather than being normalized or corrected.

<arpeg> → model.controlEventLike.cmn → model.editTransPart.music → model.editTransPart → <orig>

**<rdg>** (reading) – Contains a single reading within a textual variation.

<arpeg> → model.controlEventLike.cmn → model.rdgPart.music → model.rdgPart → <rdg>

**<reg>** Contains material which has been regularized or normalized in some sense.

<arpeg> → model.controlEventLike.cmn → model.editTransPart.music → model.editTransPart → <reg>

**<restore>** Indicates restoration of material to an earlier state by cancellation of an editorial or authorial marking or instruction.

<arpeg> → model.controlEventLike.cmn → model.editTransPart.music → model.editTransPart → <restore>

**<sic>** Contains apparently incorrect or inaccurate material.

<arpeg> → model.controlEventLike.cmn → model.editTransPart.music → model.editTransPart → <sic>

**<supplied>** Contains material supplied by the transcriber or editor for any reason.

<arpeg> → model.controlEventLike.cmn → model.editTransPart.music → model.editTransPart → <supplied>

**<unclear>** Contains material that cannot be transcribed with certainty because it is illegible or inaudible in the source.

<arpeg> → model.controlEventLike.cmn → model.editTransPart.music → model.editTransPart → <unclear>

## May Contain

– (<arpeg> may not have child elements)

## Remarks

The modern arpeggiation symbol is a vertical wavy line preceding the chord. When the notes of the chord are to be performed from highest to lowest, an arrowhead may be added to the lower end of the line. Even though it is redundant, an arrowhead is sometimes added to the upper end of the line for the sake of consistency or when the direction of successive arpeggios alternates. In music for keyboard instruments, sometimes a distinction is made between a single arpeggio in which both hands play successively and simultaneous arpeggios in two hands. In the case of the former, multiple values may be required in the staff and layer attributes. Arpeggios that do not cross staves, but still involve more than one layer require multiple values for the layer attribute.

### Attributes

**@analog** (*optional*) Contains a reference to a field or element in another descriptive encoding system to which this MEI element is comparable. Value is plain text.

<arranger> → [att.bibl](#) → @analog

**@cert** (*optional*) Signifies the degree of certainty or precision associated with a feature. Value conforms to [data.CERTAINTY](#).

<arranger> → [att.evidence](#) → @cert

**@class** (*optional*) Contains one or more URIs which denote classification terms that apply to the entity bearing this attribute. One or more values from [data.URI](#), separated by spaces.

<arranger> → [att.common](#) → [att.typed](#) → [att.classed](#) → @class

**@copyof** (*optional*) Points to an element of which the current element is a copy. Value conforms to [data.URI](#).

<arranger> → [att.common](#) → [att.linkin](#) → @copyof

**@corresp** (*optional*) Used to point to other elements that correspond to this one in a generic fashion. One or more values from [data.URI](#), separated by spaces.

<arranger> → [att.common](#) → [att.linkin](#) → @corresp

**@evidence** (*optional*) Indicates the nature of the evidence supporting the reliability or accuracy of the intervention or interpretation. Allowed values are: "**internal**" (*There is evidence within the document to support the intervention.*), "**external**" (*There is evidence outside the document to support the intervention.*), "**conjecture**" (*The assertion has been made by the editor, cataloguer, or scholar on the basis of their expertise.*)

<arranger> → [att.evidence](#) → @evidence

**@facs** (*optional*) Points to one or more images, portions of an image, or surfaces which correspond to the current element. One or more values from [data.URI](#), separated by spaces.

<arranger> → [att.facsimile](#) → @facs

**@follows** (*optional*) points to one or more events in a user-defined collection that are known to be predecessors of the current element. One or more values from [data.URI](#), separated by spaces.

<arranger> → [att.common](#) → [att.linkin](#) → @follows

**@label** (*optional*) Captures text to be used to generate a label for the element to which it's attached, a "tool tip" or prefatory text, for example. Should not be used to record document content. Value is plain text.

<arranger> → [att.common](#) → [att.labelled](#) → @label

**@on** (*optional*) Provides a number-like designation that indicates an element's position in a sequence of similar elements. May not contain space characters. Value conforms to [data.WORD](#).

<arranger> → att.common → att.nNumberLike → @n

**@next** (*optional*) Used to point to the next event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<arranger> → att.common → att.linking → @next

**@precedes** (*optional*) Points to one or more events in a user-defined collection that are known to be successors of the current element. One or more values from [data.URI](#), separated by spaces.

<arranger> → att.common → att.linking → @precedes

**@prev** (*optional*) Points to the previous event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<arranger> → att.common → att.linking → @prev

**@resp** (*optional*) Indicates the agent(s) responsible for some aspect of the text's transcription, editing, or encoding. Its value must point to one or more identifiers declared in the document header. One or more values from [data.URI](#), separated by spaces.

<arranger> → att.common → att.responsibility → @resp

**@sameas** (*optional*) Points to an element that is the same as the current element but is not a literal copy of the current element. One or more values from [data.URI](#), separated by spaces.

<arranger> → att.common → att.linking → @sameas

**@synch** (*optional*) Points to elements that are synchronous with the current element. One or more values from [data.URI](#), separated by spaces.

<arranger> → att.common → att.linking → @synch

**@translit** (*optional*) Specifies the transliteration technique used. Value is a [NMTOKEN](#).

<arranger> → att.lang → @translit

**@type** (*optional*) Designation which characterizes the element in some sense, using any convenient classification scheme or typology that employs single-token labels. One or more values of datatype [NMTOKEN](#), separated by spaces.

<arranger> → att.common → att.typed → @type

**@xml:base** (*optional*) Provides a base URI reference with which applications can resolve relative URI references into absolute URI references. Value conforms to [data.URI](#).

<arranger> → att.common → att.basic → @xml:base

**@xml:id** (*optional*) Regularizes the naming of an element and thus facilitates building links between it and other resources. Each id attribute within a document must have a unique value. Value is a valid [xml:id](#).

<arranger> → att.common → att.basic → att.id → @xml:id

**@xml:lang** (*optional*) Identifies the language of the element's content. The values for this attribute are language 'tags' as defined in BCP 47. All language tags that make use of private use sub-tags must be documented in a corresponding language element in the MEI header whose id attribute is the same as the language tag's value. Value is a [language](#).

<arranger> → att.lang → @xml:lang

## Member of

**model.respLikePart** Groups elements that delineate particular responsibilities as opposed to the respStmt element that provides for generic statements of responsibility.

### Contained By

**<analytic>** Contains bibliographic elements describing an item (e.g., an article or poem) published within a monograph or journal and not as an independent publication.

<arranger> → model.respLikePart → <analytic>

**<bibl>** Provides a loosely-structured bibliographic citation in which the sub-components may or may not be explicitly marked.

<arranger> → model.respLikePart → model.respLike → model.biblPart → <bibl>

**<byline>** Contains the primary statement of responsibility given for a work on its title page.

<arranger> → model.respLikePart → <byline>

**<editionStmt>** Container for meta-data pertaining to a particular edition of the material being described.

<arranger> → model.respLikePart → <editionStmt>

**<expression>** Intellectual or artistic realization of a work.

<arranger> → model.respLikePart → <expression>

**<monogr>** Contains bibliographic elements describing an item, for example, a published book or journal, score, recording, or an unpublished manuscript.

<arranger> → model.respLikePart → <monogr>

**<seriesStmt>** Groups information about the series, if any, to which a publication belongs.

<arranger> → model.respLikePart → <seriesStmt>

**<titlePage>** Contains a transcription of the title page of a text.

<arranger> → model.respLikePart → model.titlePagePart → <titlePage>

**<titleStmt>** Container for title and responsibility meta-data.

<arranger> → model.respLikePart → model.respLike → <titleStmt>

**<work>** Provides a detailed description of a work — a distinct intellectual or artistic creation — specifically its history, language use, and high-level musical attributes (e.g., key, tempo, meter, medium of performance, and intended duration).

<arranger> → model.respLikePart → <work>

### May Contain

**<abbr>** A generic element for 1) a shortened form of a word, including an acronym or 2) a shorthand notation.

<arranger> → model.textPhraseLike.limited → model.editorialLike → <abbr>

**<address>** Contains a postal address, for example of a publisher, an organization, or an individual.

<arranger> → model.textPhraseLike.limited → model.addressLike → <address>

**<annot>** Provides a statement explaining the text or indicating the basis for an assertion.

<arranger> → model.textPhraseLike.limited → model.annotLike → <annot>

**<bibl>** Provides a loosely-structured bibliographic citation in which the sub-components may or may not be explicitly marked.

<arranger> → model.textPhraseLike.limited → model.biblLike → <bibl>

**<biblStruct>** Contains a bibliographic citation in which bibliographic sub-elements must appear in a specified order.

<arranger> → model.textPhraseLike.limited → model.biblLike → <biblStruct>

**<bloc>** Contains the name of a geopolitical unit consisting of two or more nation states or countries.

<arranger> → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <bloc>

**<catchwords>** Describes the system used to ensure correct ordering of the quires making up an item, typically by means of annotations at the foot of the page.

<arranger> → model.textPhraseLike.limited → model.mslinline → <catchwords>

**<corpName>** Identifies an organization or group of people that acts as a single entity.

<arranger> → model.textPhraseLike.limited → model.nameLike → model.nameLike.agent → <corpName>

**<country>** Contains the name of a geopolitical unit, such as a nation, country, colony, or commonwealth, larger than or administratively superior to a region and smaller than a bloc.

<arranger> → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <country>

**<date>** A string identifying a point in time or the time period between two such points.

<arranger> → model.textPhraseLike.limited → model.dateLike → <date>

**<dedicatee>** Entity to whom a creative work is formally offered.

<arranger> → model.textPhraseLike.limited → <dedicatee>

**<depth>** Description of a measurement taken through a three-dimensional object.

<arranger> → model.textPhraseLike.limited → model.dimLike → <depth>

**<dim>** Any single dimensional specification.

<arranger> → model.textPhraseLike.limited → model.dimLike → <dim>

**<dimensions>** Information about the physical size of an entity; usually includes numerical data.

<arranger> → model.textPhraseLike.limited → <dimensions>

**<district>** Contains the name of any kind of subdivision of a settlement, such as a parish, ward, or other administrative or geographic unit.

<arranger> → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <district>

**<expan>** Contains the expansion of an abbreviation.

<arranger> → model.textPhraseLike.limited → model.editorialLike → <expan>

**<extent>** Used to express size in terms other than physical dimensions, such as number of pages, records, bytes, physical components, etc.

<arranger> → model.textPhraseLike.limited → <extent>

**<fig>** Groups elements representing or containing graphic information such as an illustration or figure.

<arranger> → model.textPhraseLike.limited → model.figureLike → <fig>

**<geogFeat>** Contains a common noun identifying a geographical feature.

<arranger> → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <geogFeat>

**<geogName>** The proper noun designation for a place, natural feature, or political jurisdiction.

<arranger> → model.textPhraseLike.limited → model.nameLike → model.nameLike.place → model.nameLike.geogName → <geogName>

**<height>** Description of the vertical size of an object.

<arranger> → model.textPhraseLike.limited → model.dimLike → <height>

**<heraldry>** Contains a heraldic formula or phrase, typically found as part of a blazon, coat of arms, etc.

<arranger> → model.textPhraseLike.limited → model.mslinline → <heraldry>

**<identifier>** An alpha-numeric string that establishes the identity of the described material.

<arranger> → model.textPhraseLike.limited → model.identifierLike → <identifier>

**<lb>** An empty formatting element that forces text to begin on a new line.

<arranger> → model.textPhraseLike.limited → model.lbLike → <lb>

**<locus>** Defines a location within a manuscript or manuscript component, usually as a (possibly discontinuous) sequence of folio references.

<arranger> → model.textPhraseLike.limited → model.mslinline → <locus>

**<locusGrp>** Groups locations which together form a distinct but discontinuous item within a manuscript or manuscript part, according to a specific foliation.

<arranger> → model.textPhraseLike.limited → model.mslinline → <locusGrp>

**<name>** Proper noun or noun phrase.

<arranger> → model.textPhraseLike.limited → model.nameLike → <name>

**<num>** Numeric information in any form.

<arranger> → model.textPhraseLike.limited → model.measurementLike → model.numLike → <num>

**<periodName>** A label that describes a period of time, such as 'Baroque' or '3rd Style period'.

<arranger> → model.textPhraseLike.limited → model.nameLike.label → <periodName>

**<persName>** Designation for an individual, including any or all of that individual's forenames, surnames, honorific titles, and added names.

<arranger> → model.textPhraseLike.limited → model.nameLike → model.nameLike.agent → <persName>

**<postBox>** (postal box or post office box) contains a number or other identifier for some postal delivery point other than a street address.

<arranger> → model.textPhraseLike.limited → model.addressPart → <postBox>

**<postCode>** (postal code) contains a numerical or alphanumeric code used as part of a postal address to simplify sorting or delivery of mail.

<arranger> → model.textPhraseLike.limited → model.addressPart → <postCode>

**<ptr>** Defines a traversible pointer to another location, using only attributes to describe the destination.

<arranger> → model.textPhraseLike.limited → model.locrefLike → <ptr>

**<q>** Contains material which is distinguished from the surrounding phrase-level text using quotation marks or a similar method. Use **<quote>** for block-level quotations.

<arranger> → model.textPhraseLike.limited → model.qLike → <q>

**<ref>** Defines a traversible reference to another location. May contain text and sub-elements that describe the destination.

<arranger> → model.textPhraseLike.limited → model.locrefLike → <ref>

**<region>** Contains the name of an administrative unit such as a state, province, or county, larger than a settlement, but smaller than a country.

<arranger> → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <region>

**<relation>** Describes a relationship or linkage amongst entities.

<arranger> → model.textPhraseLike.limited → model.relationLike → <relation>

**<relationList>** Gathers relation elements.

<arranger> → model.textPhraseLike.limited → model.relationLike → <relationList>

**<rend>** A formatting element indicating special visual rendering, e.g., bold or italicized, of a text word or phrase.

<arranger> → model.textPhraseLike.limited → model.rendLike → <rend>

**<repository>** Institution, agency, or individual which holds a bibliographic item.

<arranger> → model.textPhraseLike.limited → model.nameLike → model.nameLike.place → model.repositoryLike → <repository>

**<secFolio>** Marks the word or words taken from a fixed point in a codex (typically the beginning of the second leaf) in order to provide a unique identifier for the item.

<arranger> → model.textPhraseLike.limited → model.mslnline → <secFolio>

**<seg>** (arbitrary segment) represents any segmentation of text below the "text component" level.

<arranger> → model.textPhraseLike.limited → <seg>

**<settlement>** Contains the name of a settlement such as a city, town, or village identified as a single geopolitical or administrative unit.

<arranger> → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <settlement>

**<signatures>** Provides a description of the leaf or quire signatures found within a codex.

<arranger> → model.textPhraseLike.limited → model.mslnline → <signatures>

**<stack>** An inline table with a single column.

<arranger> → model.textPhraseLike.limited → model.rendLike → <stack>

**<stamp>** Contains a word or phrase describing an official mark indicating ownership, genuineness, validity, etc.

<arranger> → model.textPhraseLike.limited → model.mslnline → <stamp>

**<street>** full street address including any name or number identifying a building as well as the name of the street or route on which it is located.

<arranger> → model.textPhraseLike.limited → model.addressPart → <street>

**<styleName>** A label for a characteristic style of writing or performance, such as 'bebop' or 'rock-n-roll'.

<arranger> → model.textPhraseLike.limited → model.nameLike.label → <styleName>

**<symbol>** A reference to a previously defined symbol.

<arranger> → model.textPhraseLike.limited → <symbol>

**<term>** Keyword or phrase which describes a resource.

<arranger> → model.textPhraseLike.limited → <term>

**<title>** Title of a bibliographic entity.

<arranger> → model.textPhraseLike.limited → model.titleLike → <title>

**<watermark>** Contains a description of a watermark or similar device.

<arranger> → model.textPhraseLike.limited → model.mslnline → <watermark>

**<width>** Description of the horizontal size of an object.

<arranger> → model.textPhraseLike.limited → model.dimLike → <width>

## Declaration

```

<elementSpec ident="arranger" module="MEI.shared">

## <artic>

(articulation) – An indication of how to play a note or chord.

### Referenced in chapters

[2.2.4.3 Accidentals, Articulation Symbols, Augmentation Dots, and Custos Signs](#), [4.2.5.2.1 Chords in CMN](#),  
[4.3.5 Articulation and Performance Instructions in CMN](#)

### Module

[MEI.shared](#)

### Attributes

**@altsym** (*optional*) Provides a way of pointing to a user-defined symbol. It must contain a reference to an ID of a [<symbolDef>](#) element elsewhere in the document. Value conforms to [data.URI](#).

<artic> → att.artic.vis → att.altsym → @altsym

**@artic** (*optional*) Encodes the written articulation(s). Articulations are normally encoded in order from the note head outward; that is, away from the stem. See additional notes at att.vis.note. Only articulations should be encoded in the artic attribute; for example, fingerings should be encoded using the [<fing>](#) element. One or more values from [data.ARTICULATION](#), separated by spaces.

<artic> → att.artic.log → att.articulation → @artic

**@artic.ges** (*optional*) Records performed articulation that differs from the written value. One or more values from [data.ARTICULATION](#), separated by spaces.

<artic> → att.artic.ges → att.articulation.ges → @artic.ges

**@class** (*optional*) Contains one or more URIs which denote classification terms that apply to the entity bearing this attribute. One or more values from [data.URI](#), separated by spaces.

<artic> → att.common → att.typed → att.classed → @class

**@color** (*optional*) Used to indicate visual appearance. Do not confuse this with the musical term 'color' as used in pre-CMN notation. Value conforms to [data.COLOR](#).

<artic> → att.artic.vis → att.color → @color

**@copyof** (*optional*) Points to an element of which the current element is a copy. Value conforms to [data.URI](#).

<artic> → att.common → att.linking → @copyof

**@corresp** (*optional*) Used to point to other elements that correspond to this one in a generic fashion. One or more values from [data.URI](#), separated by spaces.

<artic> → att.common → att.linking → @corresp

**@enclose** (*optional*) Records the characters often used to mark accidentals, articulations, and sometimes notes as having a cautionary or editorial function. For an example of cautionary accidentals enclosed in parentheses, see Read, p. 131, ex. 9-14. Value conforms to [data.ENCLOSURE](#).

<artic> → att.artic.vis → att.enclosingChars → @enclose

**@evaluate** (*optional*) Specifies the intended meaning when a participant in a relationship is itself a pointer. Allowed values are: "**all**" (*If an element pointed to is itself a pointer, then the target of that pointer will be taken, and so on, until an element is found which is not a pointer.*), "**one**" (*If an element pointed to is itself a pointer, then its target (whether a pointer or not) is taken as the target of this pointer.*), "**none**" (*No further evaluation of targets is carried out beyond that needed to find the element(s) specified in plist or target attribute.*)

<artic> → att.artic.log → att.controlEvent → att.targetEval → @evaluate

**@facsimile** (*optional*) Points to one or more images, portions of an image, or surfaces which correspond to the current element. One or more values from [data.URI](#), separated by spaces.

<artic> → att.facsimile → @facsimile

**@follows** (*optional*) points to one or more events in a user-defined collection that are known to be predecessors of the current element. One or more values from [data.URI](#), separated by spaces.

<artic> → att.common → att.linking → @follows

**@fontfam** (*optional*) Contains the name of a font-family. Value conforms to [data.FONTFAMILY](#).

<artic> → att.artic.vis → att.typography → @fontfam

**@fontname** (*optional*) Holds the name of a font. Value conforms to [data.FONTNAME](#).

<artic> → att.artic.vis → att.typography → @fontname

**@fontsize** (*optional*) Indicates the size of a font expressed in printers' points, i.e., 1/72nd of an inch, relative terms, e.g., small, larger, etc., or percentage values relative to normal size, e.g., 125%. Value conforms to [data.FONTSIZE](#).

<artic> → att.artic.vis → att.typography → @fontsize

**@fontstyle** (*optional*) Records the style of a font, i.e., italic, oblique, or normal. Value conforms to [data.FONTSTYLE](#).

<artic> → att.artic.vis → att.typography → @fontstyle

**@fontweight** (*optional*) Used to indicate bold type. Value conforms to [data.FONTWEIGHT](#).

<artic> → att.artic.vis → att.typography → @fontweight

**@glyph.auth** (*optional*) A name or label associated with the controlled vocabulary from which the value of `glyph.name` or `glyph.num` is taken, or the textual content of the element. Allowed values are: "**smufl**" (*Standard Music Font Layout*.)

<artic> → att.artic.vis → att.extSym → att.extSym.auth → @glyph.auth

**@glyph.name** (*optional*) Glyph name. Value is plain text.

<artic> → att.artic.vis → att.extSym → att.extSym.names → @glyph.name

**@glyph.num** (*optional*) Numeric glyph reference in hexadecimal notation, e.g., "#xE000" or "U+E000". N.B. SMuFL version 1.18 uses the range U+E000 - U+ECBF. Value conforms to [data.HEXNUM](#).

<artic> → att.artic.vis → att.extSym → att.extSym.names → @glyph.num

**@glyph.uri** (*optional*) The web-accessible location of the controlled vocabulary from which the value of `glyph.name` or `glyph.num` is taken, or the textual content of the element. Value conforms to [data.URI](#).

<artic> → att.artic.vis → att.extSym → att.extSym.auth → @glyph.uri

**@ho** (*optional*) Records a horizontal adjustment to a feature's programmatically-determined location in terms of staff interline distance; that is, in units of 1/2 the distance between adjacent staff lines. Value conforms to [data.MEASUREMENTSIGNED](#).

<artic> → att.artic.vis → att.visualOffset → att.visualOffset.ho → @ho

**@label** (*optional*) Captures text to be used to generate a label for the element to which it's attached, a "tool tip" or prefatory text, for example. Should not be used to record document content. Value is plain text.

<artic> → att.common → att.labelled → @label

**@layer** (*optional*) Identifies the layer to which a feature applies. One or more values of datatype **positiveInteger**, separated by spaces.

<artic> → att.artic.log → att.controlEvent → att.layerIdent → @layer

**@letterspacing** (*optional*) Indicates letter spacing (aka tracking) in analogy to the CSS letter-spacing property. Value conforms to [data.MEASUREMENTTYPOGRAPHYSIGNED](#).

<artic> → att.artic.vis → att.typography → @letterspacing

**@lineheight** (*optional*) Indicates line height in analogy to the CSS line-height property. Value conforms to either [data.MEASUREMENTTYPOGRAPHYUNSIGNED](#) or [data.PERCENT](#).

<artic> → att.artic.vis → att.typography → @lineheight

**@loc** (*optional*) Holds the staff location of the feature. Value conforms to [data.STAFFLOC](#).

<artic> → att.artic.vis → att.staffLoc → @loc

**@on** (*optional*) Provides a number-like designation that indicates an element's position in a sequence of similar elements. May not contain space characters. Value conforms to [data.WORD](#).

<artic> → att.common → att.nNumberLike → @on

**@next** (*optional*) Used to point to the next event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<artic> → att.common → att.linked → @next

**@oloc** (*optional*) Records staff location in terms of written octave. Value conforms to [data.OCTAVE](#).

<artic> → att.artic.vis → att.staffLoc.pitched → @oloc

**@onstaff** (*optional*) Indicates the placement of the item within the staff. A value of 'true' means on the staff, and 'false' off the staff. Value conforms to [data.BOOLEAN](#).

<artic> → att.artic.vis → att.placementOnStaff → @onstaff

**@part** (*optional*) Indicates the part in which the current feature should appear. Use '%all' when the feature should occur in every part. One or more values of datatype **a string matching the following regular expression: "(%all|#[\w][\w]+)"**, separated by spaces.

<artic> → att.artic.log → att.controlEvent → att.partIdent → @part

**@partstaff** (*optional*) Signifies the part staff on which a notated feature occurs. Use '%all' when the feature should occur on every staff. One or more values of datatype **a string matching the following regular expression: "(%all|\d+(-\d+)?)"**, separated by spaces.

<artic> → att.artic.log → att.controlEvent → att.partIdent → @partstaff

**@place** (*optional*) Captures the placement of the item with respect to the event with which it is associated. Value conforms to [data.STAFFREL](#).

<artic> → att.artic.vis → att.placementRelEvent → @place

**@plist** (*optional*) When the target attribute is present, plist identifies the active participants; that is, those entities pointed "from", in a relationship with the specified target(s). When the target attribute is not present, it identifies participants in a mutual relationship. One or more values from [data.URI](#), separated by spaces.

<artic> → att.artic.log → att.controlEvent → att.plist → @plist

**@ploc** (*optional*) Captures staff location in terms of written pitch name. Value conforms to [data.PITCHNAME](#).

<artic> → att.artic.vis → att.staffLoc.pitched → @ploc

**@precedes** (*optional*) Points to one or more events in a user-defined collection that are known to be successors of the current element. One or more values from [data.URI](#), separated by spaces.

<artic> → att.common → att.linking → @precedes

**@prev** (*optional*) Points to the previous event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<artic> → att.common → att.linking → @prev

**@resp** (*optional*) Indicates the agent(s) responsible for some aspect of the text's transcription, editing, or encoding. Its value must point to one or more identifiers declared in the document header. One or more values from [data.URI](#), separated by spaces.

<artic> → att.common → att.responsibility → @resp

**@sameas** (*optional*) Points to an element that is the same as the current element but is not a literal copy of the current element. One or more values from [data.URI](#), separated by spaces.

<artic> → att.common → att.linking → @sameas

**@staff** (*recommended*) Signifies the staff on which a notated event occurs or to which a control event applies. Mandatory when applicable. One or more values of datatype **positiveInteger**, separated by spaces.

<artic> → att.artic.log → att.controlEvent → att.staffIdnt → @staff

**@synch** (*optional*) Points to elements that are synchronous with the current element. One or more values from [data.URI](#), separated by spaces.

<artic> → att.common → att.linking → @synch

**@to** (*optional*) Records a timestamp adjustment of a feature's programmatically-determined location in terms of musical time; that is, beats. Value conforms to [data.TSTAMPOFFSET](#).

<artic> → att.artic.vis → att.visualOffset → att.visualOffset.to → @to

**@tstamp** (*optional*) Encodes the onset time in terms of musical time, i.e., beats[.fractional beat part], as expressed in the written time signature. Value conforms to [data.BEAT](#).

<artic> → att.artic.log → att.controlEvent → att.timestamp.log → @tstamp

**@tstamp.ges** (*optional*) Encodes the onset time in terms of musical time, i.e., beats[.fractional beat part], as expressed in the written time signature. Value conforms to [data.BEAT](#).

<artic> → att.artic.log → att.controlEvent → att.timestamp.ges → @tstamp.ges

**@tstamp.real** (*optional*) Records the onset time in terms of ISO time. Value conforms to [data.ISOTIME](#).

<artic> → att.artic.log → att.controlEvent → att.timestamp.ges → @tstamp.real

**@type** (*optional*) Designation which characterizes the element in some sense, using any convenient classification scheme or typology that employs single-token labels. One or more values of datatype **NMTOKEN**, separated by spaces.

<artic> → att.common → att.typed → @type

**@vo** (*optional*) Records the vertical adjustment of a feature's programmatically-determined location in terms of staff interline distance; that is, in units of 1/2 the distance between adjacent staff lines. Value conforms to [data.MEASUREMENTSIGNED](#).

<artic> → att.artic.vis → att.visualOffset → att.visualOffset.vo → @vo

**@when** (*optional*) Indicates the point of occurrence of this feature along a time line. Its value must be the ID of a <when> element elsewhere in the document. Value conforms to [data.URI](#).

<artic> → att.artic.log → att.controlEvent → att.alignment → @when

**@x** (*optional*) Encodes an x coordinate for a feature in an output coordinate system. When it is necessary to record the placement of a feature in a facsimile image, use the `fac` attribute. Value is a decimal number.

<artic> → att.artic.vis → att.xy → @x

**@xml:base** (*optional*) Provides a base URI reference with which applications can resolve relative URI references into absolute URI references. Value conforms to [data.URI](#).

<artic> → att.common → att.basic → @xml:base

**@xml:id** (*optional*) Regularizes the naming of an element and thus facilitates building links between it and other resources. Each id attribute within a document must have a unique value. Value is a valid [xml:id](#).

<artic> → att.common → att.basic → att.id → @xml:id

**@y** (*optional*) Encodes a y coordinate for a feature in an output coordinate system. When it is necessary to record the placement of a feature in a facsimile image, use the `fac` attribute. Value is a decimal number.

<artic> → att.artic.vis → att.xy → @y

## Member of

[model.chordPart](#) Groups elements that may appear as part of the content of a chord element.

[model.noteModifierLike](#) Groups elements that modify note-like features.

## Contained By

**<abbr>** A generic element for 1) a shortened form of a word, including an acronym or 2) a shorthand notation.

<artic> → model.noteModifierLike → model.layerPart.mensuralAndNeumes → model.layerPart → <abbr>

**<add>** Marks an addition to the text.

<artic> → model.noteModifierLike → model.layerPart.mensuralAndNeumes → model.layerPart → <add>

**<chord>** A simultaneous sounding of two or more notes in the same layer \*with the same duration\*.

<artic> → model.chordPart → <chord>

**<corr>** Contains the correct form of an apparent erroneous passage.

<artic> → model.noteModifierLike → model.layerPart.mensuralAndNeumes → model.layerPart → <corr>

**<damage>** Contains an area of damage to the physical medium.

<artic> → model.noteModifierLike → model.layerPart.mensuralAndNeumes → model.layerPart → <damage>

**<del>** Contains information deleted, marked as deleted, or otherwise indicated as superfluous or spurious in the copy text by an author, scribe, annotator, or corrector.

<artic> → model.noteModifierLike → model.layerPart.mensuralAndNeumes → model.layerPart → <del>

**<expan>** Contains the expansion of an abbreviation.

<artic> → model.noteModifierLike → model.layerPart.mensuralAndNeumes → model.layerPart → <expan>

**<layer>** An independent stream of events on a staff.

<artic> → model.noteModifierLike → model.layerPart.mensuralAndNeumes → model.layerPart → <layer>

**<lem>** (lemma) – Contains the lemma, or base text, of a textual variation.

<artic> → model.noteModifierLike → model.layerPart.mensuralAndNeumes → model.layerPart → <lem>

**<note>** A single pitched event.

<artic> → model.noteModifierLike → <note>

**<oLayer>** A layer that contains an alternative to material in another layer.

<artic> → model.noteModifierLike → model.layerPart.mensuralAndNeumes → model.layerPart → <oLayer>

**<orig>** Contains material which is marked as following the original, rather than being normalized or corrected.

<artic> → model.noteModifierLike → model.layerPart.mensuralAndNeumes → model.layerPart → <orig>

**<rdg>** (reading) – Contains a single reading within a textual variation.

<artic> → model.noteModifierLike → model.layerPart.mensuralAndNeumes → model.layerPart → <rdg>

**<reg>** Contains material which has been regularized or normalized in some sense.

<artic> → model.noteModifierLike → model.layerPart.mensuralAndNeumes → model.layerPart → <reg>

**<restore>** Indicates restoration of material to an earlier state by cancellation of an editorial or authorial marking or instruction.

<artic> → model.noteModifierLike → model.layerPart.mensuralAndNeumes → model.layerPart → <restore>

**<sic>** Contains apparently incorrect or inaccurate material.

<artic> → model.noteModifierLike → model.layerPart.mensuralAndNeumes → model.layerPart → <sic>

**<supplied>** Contains material supplied by the transcriber or editor for any reason.

<artic> → model.noteModifierLike → model.layerPart.mensuralAndNeumes → model.layerPart → <supplied>

**<unclear>** Contains material that cannot be transcribed with certainty because it is illegible or inaudible in the source.

<artic> → model.noteModifierLike → model.layerPart.mensuralAndNeumes → model.layerPart → <unclear>

## May Contain

– (<artic> may not have child elements)

## Remarks

Articulations typically affect duration, such as staccato marks, or the force of attack, such as accents. This element provides an alternative to the artic attribute on the **<note>** and **<chord>** elements. It may be used when specific display info, such as size or color, needs to be recorded for the articulation or when multiple articulation marks occur on a single note or chord.

## Declaration

```
<elementSpec ident="artic" module="MEI.shared">
  <gloss versionDate="2022-05-18" xml:lang="en">articulation</gloss>

It may be used when specific display info, such as size or color, needs to be recorded for the articulation or when multiple articulation marks occur on a single note or chord.</p>
</remarks>
</elementSpec>
```

## <attUsage>

Documents the usage of a specific attribute of the element.

### Module

[MEI.header](#)

### Attributes

**@analog** (*optional*) Contains a reference to a field or element in another descriptive encoding system to which this MEI element is comparable. Value is plain text.

<attUsage> → [att.bibl](#) → @analog

**@class** (*optional*) Contains one or more URIs which denote classification terms that apply to the entity bearing this attribute. One or more values from [data.URI](#), separated by spaces.

<attUsage> → [att.common](#) → [att.typed](#) → [att.classed](#) → @class

**@context** (*optional*) Circumstances in which the element appears, an XPath expression. Value is plain text.

<attUsage> → direct children → @context

**@copyof** (*optional*) Points to an element of which the current element is a copy. Value conforms to [data.URI](#).

<attUsage> → [att.common](#) → [att.linkin](#) → @copyof

**@corresp** (*optional*) Used to point to other elements that correspond to this one in a generic fashion. One or more values from [data.URI](#), separated by spaces.

<attUsage> → [att.common](#) → [att.linkin](#) → @corresp

**@follows** (*optional*) points to one or more events in a user-defined collection that are known to be predecessors of the current element. One or more values from [data.URI](#), separated by spaces.

<attUsage> → [att.common](#) → [att.linkin](#) → @follows

**@label** (*optional*) Captures text to be used to generate a label for the element to which it's attached, a "tool tip" or prefatory text, for example. Should not be used to record document content. Value is plain text.

<attUsage> → [att.common](#) → [att.labelled](#) → @label

**@n** (*optional*) Provides a number-like designation that indicates an element's position in a sequence of similar elements. May not contain space characters. Value conforms to [data.WORD](#).

<attUsage> → [att.common](#) → [att.nNumberLike](#) → @n

**@name** (*required*) Name of the attribute. Value conforms to [data.NMOKEN](#).

<attUsage> → direct children → @name

**@next** (*optional*) Used to point to the next event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<attUsage> → [att.common](#) → [att.linkin](#) → @next

**@precedes** (*optional*) Points to one or more events in a user-defined collection that are known to be successors of the current element. One or more values from [data.URI](#), separated by spaces.

<attUsage> → [att.common](#) → [att.linkin](#) → @precedes

**@prev** (*optional*) Points to the previous event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<attUsage> → att.common → att.linkin → @prev

**@resp** (*optional*) Indicates the agent(s) responsible for some aspect of the text's transcription, editing, or encoding. Its value must point to one or more identifiers declared in the document header. One or more values from [data.URI](#), separated by spaces.

<attUsage> → att.common → att.responsibility → @resp

**@sameas** (*optional*) Points to an element that is the same as the current element but is not a literal copy of the current element. One or more values from [data.URI](#), separated by spaces.

<attUsage> → att.common → att.linkin → @sameas

**@synch** (*optional*) Points to elements that are synchronous with the current element. One or more values from [data.URI](#), separated by spaces.

<attUsage> → att.common → att.linkin → @synch

**@type** (*optional*) Designation which characterizes the element in some sense, using any convenient classification scheme or typology that employs single-token labels. One or more values of datatype **NMTOKEN**, separated by spaces.

<attUsage> → att.common → att.typed → @type

**@xml:base** (*optional*) Provides a base URI reference with which applications can resolve relative URI references into absolute URI references. Value conforms to [data.URI](#).

<attUsage> → att.common → att.basic → @xml:base

**@xml:id** (*optional*) Regularizes the naming of an element and thus facilitates building links between it and other resources. Each id attribute within a document must have a unique value. Value is a valid [xml:id](#).

<attUsage> → att.common → att.basic → att.id → @xml:id

## Member of

(attUsage isn't member of any model class)

## Contained By

**<namespace>** Supplies the formal name of the namespace to which the elements documented by its children belong.

<attUsage> → elements having attUsage as direct children → <namespace>

**<tagUsage>** Documents the usage of a specific element within the document.

<attUsage> → elements having attUsage as direct children → <tagUsage>

## May Contain

**<desc>** Container for text that briefly describes the feature to which it is attached, including its intended usage, purpose, or application as appropriate.

<attUsage> → direct children → <desc>

## Constraints

@context attribute should contain an XPath expression.

## Declaration

```
<elementSpec ident="attUsage" module="MEI.header">
  <desc xml:lang="en">Documents the usage of a specific attribute of the element.</desc>
  <classes>
    <memberOf key="att.common"/>
    <memberOf key="att.bibl"/>
  </classes>
  <content>
    <rng:optional>
      <rng:ref name="desc"/>
    </rng:optional>
  </content>
  <constraintSpec ident="context_attribute_requires_content" scheme="schematron">
    <constraint>
      <sch:rule context="@context">
        <sch:assert role="warning" test="not(normalize-space(.) eq '')">@context attribute
          should contain an XPath expression.</sch:assert>
      </sch:rule>
    </constraint>
  </constraintSpec>
  <attList>
    <attDef ident="name" usage="req">
      <desc xml:lang="en">Name of the attribute.</desc>
      <datatype>
        <rng:ref name="data.NMTOKEN"/>
      </datatype>
    </attDef>
    <attDef ident="context" usage="opt">
      <desc xml:lang="en">Circumstances in which the element appears, an XPath
        expression.</desc>
      <datatype>
        <rng:data type="string"/>
      </datatype>
    </attDef>
  </attList>
</elementSpec>
```

## <attacca>

An instruction to begin the next section or movement of a composition without pause.

### Module

MEI.cmn

### Attributes

**@class** (*optional*) Contains one or more URIs which denote classification terms that apply to the entity bearing this attribute. One or more values from [data.URI](#), separated by spaces.

<attacca> → att.common → att.typed → att.classed → @class

**@copyof** (*optional*) Points to an element of which the current element is a copy. Value conforms to [data.URI](#).

<attacca> → att.common → att.linking → @copyof

**@corresp** (*optional*) Used to point to other elements that correspond to this one in a generic fashion. One or more values from [data.URI](#), separated by spaces.

<attacca> → att.common → att.linking → @corresp

**@endho** (*optional*) Records the horizontal adjustment of a feature's programmatically-determined end point. Value conforms to [data.MEASUREMENTSIGNED](#).

<attacca> → att.attacca.vis → att.visualOffset2.ho → @endho

**@endid** (*optional*) Indicates the final element in a sequence of events to which the feature applies. Value conforms to [data.URI](#).

<attacca> → att.attacca.log → att.startEndId → @endid

**@endto** (*optional*) Records a timestamp adjustment of a feature's programmatically-determined end point. Value conforms to [data.TSTAMPOFFSET](#).

<attacca> → att.attacca.vis → att.visualOffset2.to → @endto

**@evaluate** (*optional*) Specifies the intended meaning when a participant in a relationship is itself a pointer. Allowed values are: "**all**" (*If an element pointed to is itself a pointer, then the target of that pointer will be taken, and so on, until an element is found which is not a pointer.*), "**one**" (*If an element pointed to is itself a pointer, then its target (whether a pointer or not) is taken as the target of this pointer.*), "**none**" (*No further evaluation of targets is carried out beyond that needed to find the element(s) specified in plist or target attribute.*)

<attacca> → att.attacca.log → att.controlEvent → att.targetEval → @evaluate

**@extender** (*optional*) Indicates the presence of an extension symbol, typically a line. Value conforms to [data.BOOLEAN](#).

<attacca> → att.attacca.vis → att.extender → @extender

**@facs** (*optional*) Points to one or more images, portions of an image, or surfaces which correspond to the current element. One or more values from [data.URI](#), separated by spaces.

<attacca> → att.facsimile → @facs

**@follows** (*optional*) points to one or more events in a user-defined collection that are known to be predecessors of the current element. One or more values from [data.URI](#), separated by spaces.

<attacca> → att.common → att.linking → @follows

**@ho** (*optional*) Records a horizontal adjustment to a feature's programmatically-determined location in terms of staff interline distance; that is, in units of 1/2 the distance between adjacent staff lines. Value conforms to [data.MEASUREMENTSIGNED](#).

<attacca> → [att.attacca.vis](#) → [att.visualOffset](#) → [att.visualOffset.ho](#) → @ho

**@label** (*optional*) Captures text to be used to generate a label for the element to which it's attached, a "tool tip" or prefatory text, for example. Should not be used to record document content. Value is plain text.

<attacca> → [att.common](#) → [att.labelled](#) → @label

**@layer** (*optional*) Identifies the layer to which a feature applies. One or more values of datatype **positiveInteger**, separated by spaces.

<attacca> → [att.attacca.log](#) → [att.controlEvent](#) → [att.layerIdent](#) → @layer

**@lendsym** (*optional*) Symbol rendered at end of line. Value conforms to [data.LINESTARTENDSYMBOL](#).

<attacca> → [att.attacca.vis](#) → [att.extender](#) → [att.lineRend](#) → @lendsym

**@lendsym.size** (*optional*) Holds the relative size of the line-end symbol. Value conforms to [data.FONTSCALE](#).

<attacca> → [att.attacca.vis](#) → [att.extender](#) → [att.lineRend](#) → @lendsym.size

**@lform** (*optional*) Describes the line style of a line. Value conforms to [data.LINEFORM](#).

<attacca> → [att.attacca.vis](#) → [att.extender](#) → [att.lineRend](#) → [att.lineRend.base](#) → @lform

**@lsegs** (*optional*) Describes the number of segments into which a dashed or dotted line may be divided, or the number of "peaks" of a wavy line; a pair of space-separated values (minimum and maximum, respectively) provides a range between which a rendering system-supplied value may fall, while a single value indicates a fixed amount of space; that is, the minimum and maximum values are equal. One or two values of datatype **a positive integer no smaller than 2**, separated by a space.

<attacca> → [att.attacca.vis](#) → [att.extender](#) → [att.lineRend](#) → [att.lineRend.base](#) → @lsegs

**@lstartsym** (*optional*) Symbol rendered at start of line. Value conforms to [data.LINESTARTENDSYMBOL](#).

<attacca> → [att.attacca.vis](#) → [att.extender](#) → [att.lineRend](#) → @lstartsym

**@lstartsym.size** (*optional*) Holds the relative size of the line-start symbol. Value conforms to [data.FONTSCALE](#).

<attacca> → [att.attacca.vis](#) → [att.extender](#) → [att.lineRend](#) → @lstartsym.size

**@lwidth** (*optional*) Width of a line. Value conforms to [data.LINEWIDTH](#).

<attacca> → [att.attacca.vis](#) → [att.extender](#) → [att.lineRend](#) → [att.lineRend.base](#) → @lwidth

**@n** (*optional*) Provides a number-like designation that indicates an element's position in a sequence of similar elements. May not contain space characters. Value conforms to [data.WORD](#).

<attacca> → [att.common](#) → [att.nNumberLike](#) → @n

**@next** (*optional*) Used to point to the next event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<attacca> → [att.common](#) → [att.linking](#) → @next

**@part** (*optional*) Indicates the part in which the current feature should appear. Use '%all' when the feature should occur in every part. One or more values of datatype **a string matching the following regular expression: "(%all|#[\i][\c]+)"**, separated by spaces.

<attacca> → [att.attacca.log](#) → [att.controlEvent](#) → [att.partIdent](#) → @part

**@partstaff** (*optional*) Signifies the part staff on which a notated feature occurs. Use '%all' when the feature should occur on every staff. One or more values of datatype **a string matching the following regular expression: "(%all|\d+(-\d+)?)"**, separated by spaces.

<attacca> → att.attacca.log → att.controlEvent → att.partId → @partstaff

**@place** (*optional*) Captures the placement of the item with respect to the staff with which it is associated. Value conforms to [data.STAFFREL](#).

<attacca> → att.attacca.vis → att.placementRelStaff → @place

**@plist** (*optional*) When the target attribute is present, plist identifies the active participants; that is, those entities pointed "from", in a relationship with the specified target(s). When the target attribute is not present, it identifies participants in a mutual relationship. One or more values from [data.URI](#), separated by spaces.

<attacca> → att.attacca.log → att.controlEvent → att.plist → @plist

**@precedes** (*optional*) Points to one or more events in a user-defined collection that are known to be successors of the current element. One or more values from [data.URI](#), separated by spaces.

<attacca> → att.common → att.linking → @precedes

**@prev** (*optional*) Points to the previous event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<attacca> → att.common → att.linking → @prev

**@resp** (*optional*) Indicates the agent(s) responsible for some aspect of the text's transcription, editing, or encoding. Its value must point to one or more identifiers declared in the document header. One or more values from [data.URI](#), separated by spaces.

<attacca> → att.common → att.responsibility → @resp

**@sameas** (*optional*) Points to an element that is the same as the current element but is not a literal copy of the current element. One or more values from [data.URI](#), separated by spaces.

<attacca> → att.common → att.linking → @sameas

**@staff** (*recommended*) Signifies the staff on which a notated event occurs or to which a control event applies. Mandatory when applicable. One or more values of datatype **positiveInteger**, separated by spaces.

<attacca> → att.attacca.log → att.controlEvent → att.staffId → @staff

**@startho** (*optional*) Records the horizontal adjustment of a feature's programmatically-determined start point. Value conforms to [data.MEASUREMENTSIGNED](#).

<attacca> → att.attacca.vis → att.visualOffset2.ho → @startho

**@startid** (*optional*) Holds a reference to the first element in a sequence of events to which the feature applies. Value conforms to [data.URI](#).

<attacca> → att.attacca.log → att.startEndId → att.startId → @startid

**@startto** (*optional*) Records a timestamp adjustment of a feature's programmatically-determined start point. Value conforms to [data.TSTAMPOFFSET](#).

<attacca> → att.attacca.vis → att.visualOffset2.to → @startto

**@synch** (*optional*) Points to elements that are synchronous with the current element. One or more values from [data.URI](#), separated by spaces.

<attacca> → att.common → att.linking → @synch

**@target** (*optional*) Indicates the next section or movement to be performed. Value conforms to [data.URI](#).

<attacca> → [att.attacca.log](#) → @target

**@to** (*optional*) Records a timestamp adjustment of a feature's programmatically-determined location in terms of musical time; that is, beats. Value conforms to [data.TSTAMPOFFSET](#).

<attacca> → [att.attacca.vis](#) → [att.visualOffset](#) → [att.visualOffset.to](#) → @to

**@translit** (*optional*) Specifies the transliteration technique used. Value is a [NMTOKEN](#).

<attacca> → [att.lang](#) → @translit

**@tstamp** (*optional*) Encodes the onset time in terms of musical time, i.e., beats[.fractional beat part], as expressed in the written time signature. Value conforms to [data.BEAT](#).

<attacca> → [att.attacca.log](#) → [att.controlEvent](#) → [att.timestamp.log](#) → @tstamp

**@tstamp.ges** (*optional*) Encodes the onset time in terms of musical time, i.e., beats[.fractional beat part], as expressed in the written time signature. Value conforms to [data.BEAT](#).

<attacca> → [att.attacca.log](#) → [att.controlEvent](#) → [att.timestamp.ges](#) → @tstamp.ges

**@tstamp.real** (*optional*) Records the onset time in terms of ISO time. Value conforms to [data.ISOTIME](#).

<attacca> → [att.attacca.log](#) → [att.controlEvent](#) → [att.timestamp.ges](#) → @tstamp.real

**@tstamp2** (*optional*) Encodes the ending point of an event, i.e., a count of measures plus a beat location in the ending measure. Value conforms to [data.MEASUREBEAT](#).

<attacca> → [att.attacca.log](#) → [att.timestamp2.log](#) → @tstamp2

**@tstamp2.ges** (*optional*) Encodes the ending point of an event, i.e., a count of measures plus a beat location in the ending measure. Value conforms to [data.MEASUREBEAT](#).

<attacca> → [att.attacca.ges](#) → [att.timestamp2.ges](#) → @tstamp2.ges

**@tstamp2.real** (*optional*) Records the ending point of an event in terms of ISO time. Value conforms to [data.ISOTIME](#).

<attacca> → [att.attacca.ges](#) → [att.timestamp2.ges](#) → @tstamp2.real

**@type** (*optional*) Designation which characterizes the element in some sense, using any convenient classification scheme or typology that employs single-token labels. One or more values of datatype [NMTOKEN](#), separated by spaces.

<attacca> → [att.common](#) → [att.typed](#) → @type

**@vgrp** (*optional*) Provides a label for members of a vertically aligned group. Value is a positive integer.

<attacca> → [att.attacca.vis](#) → [att.verticalGroup](#) → @vgrp

**@vo** (*optional*) Records the vertical adjustment of a feature's programmatically-determined location in terms of staff interline distance; that is, in units of 1/2 the distance between adjacent staff lines. Value conforms to [data.MEASUREMENTSIGNED](#).

<attacca> → [att.attacca.vis](#) → [att.visualOffset](#) → [att.visualOffset.vo](#) → @vo

**@when** (*optional*) Indicates the point of occurrence of this feature along a time line. Its value must be the ID of a [<when>](#) element elsewhere in the document. Value conforms to [data.URI](#).

<attacca> → [att.attacca.log](#) → [att.controlEvent](#) → [att.alignment](#) → @when

**@x** (*optional*) Encodes an x coordinate for a feature in an output coordinate system. When it is necessary to record the placement of a feature in a facsimile image, use the `facs` attribute. Value is a decimal number.

<attacca> → [att.attacca.vis](#) → [att.xy](#) → @x

**@xml:base** (*optional*) Provides a base URI reference with which applications can resolve relative URI references into absolute URI references. Value conforms to [data.URI](#).

<attacca> → [att.common](#) → [att.basic](#) → @xml:base

**@xml:id** (*optional*) Regularizes the naming of an element and thus facilitates building links between it and other resources. Each id attribute within a document must have a unique value. Value is a valid [xml:id](#).

<attacca> → [att.common](#) → [att.basic](#) → [att.id](#) → @xml:id

**@xml:lang** (*optional*) Identifies the language of the element's content. The values for this attribute are language 'tags' as defined in BCP 47. All language tags that make use of private use sub-tags must be documented in a corresponding language element in the MEI header whose id attribute is the same as the language tag's value. Value is a [language](#).

<attacca> → [att.lang](#) → @xml:lang

**@y** (*optional*) Encodes a y coordinate for a feature in an output coordinate system. When it is necessary to record the placement of a feature in a facsimile image, use the [facs](#) attribute. Value is a decimal number.

<attacca> → [att.attacca.vis](#) → [att.xy](#) → @y

## Member of

[model.controlEventLike.cmn](#) Groups control events that appear in CMN.

## Contained By

**<abbr>** A generic element for 1) a shortened form of a word, including an acronym or 2) a shorthand notation.

<attacca> → [model.controlEventLike.cmn](#) → [model.editTransPart.music](#) → [model.editTransPart](#) → <abbr>

**<add>** Marks an addition to the text.

<attacca> → [model.controlEventLike.cmn](#) → [model.editTransPart.music](#) → [model.editTransPart](#) → <add>

**<corr>** Contains the correct form of an apparent erroneous passage.

<attacca> → [model.controlEventLike.cmn](#) → [model.editTransPart.music](#) → [model.editTransPart](#) → <corr>

**<damage>** Contains an area of damage to the physical medium.

<attacca> → [model.controlEventLike.cmn](#) → [model.editTransPart.music](#) → [model.editTransPart](#) → <damage>

**<del>** Contains information deleted, marked as deleted, or otherwise indicated as superfluous or spurious in the copy text by an author, scribe, annotator, or corrector.

<attacca> → [model.controlEventLike.cmn](#) → [model.editTransPart.music](#) → [model.editTransPart](#) → <del>

**<expan>** Contains the expansion of an abbreviation.

<attacca> → [model.controlEventLike.cmn](#) → [model.editTransPart.music](#) → [model.editTransPart](#) → <expan>

**<lem>** (lemma) – Contains the lemma, or base text, of a textual variation.

<attacca> → [model.controlEventLike.cmn](#) → [model.rdgPart.music](#) → [model.rdgPart](#) → <lem>

**<measure>** Unit of musical time consisting of a fixed number of note values of a given type, as determined by the prevailing meter, and delimited in musical notation by bar lines.

<attacca> → [model.controlEventLike.cmn](#) → [model.measurePart](#) → <measure>

**<orig>** Contains material which is marked as following the original, rather than being normalized or corrected.

<attacca> → [model.controlEventLike.cmn](#) → [model.editTransPart.music](#) → [model.editTransPart](#) → <orig>

**<rdg>** (reading) – Contains a single reading within a textual variation.

<attacca> → model.controlEventLike.cmn → model.rdgPart.music → model.rdgPart → <rdg>

**<reg>** Contains material which has been regularized or normalized in some sense.

<attacca> → model.controlEventLike.cmn → model.editTransPart.music → model.editTransPart → <reg>

**<restore>** Indicates restoration of material to an earlier state by cancellation of an editorial or authorial marking or instruction.

<attacca> → model.controlEventLike.cmn → model.editTransPart.music → model.editTransPart → <restore>

**<sic>** Contains apparently incorrect or inaccurate material.

<attacca> → model.controlEventLike.cmn → model.editTransPart.music → model.editTransPart → <sic>

**<supplied>** Contains material supplied by the transcriber or editor for any reason.

<attacca> → model.controlEventLike.cmn → model.editTransPart.music → model.editTransPart → <supplied>

**<unclear>** Contains material that cannot be transcribed with certainty because it is illegible or inaudible in the source.

<attacca> → model.controlEventLike.cmn → model.editTransPart.music → model.editTransPart → <unclear>

## May Contain

**<abbr>** A generic element for 1) a shortened form of a word, including an acronym or 2) a shorthand notation.

<attacca> → model.textPhraseLike.limited → model.editorialLike → <abbr>

**<add>** Marks an addition to the text.

<attacca> → model.transcriptionLike → <add>

**<address>** Contains a postal address, for example of a publisher, an organization, or an individual.

<attacca> → model.textPhraseLike.limited → model.addressLike → <address>

**<anchoredText>** Container for text that is fixed to a particular page location, regardless of changes made to the layout of the measures around it.

<attacca> → model.graphicPrimitiveLike → <anchoredText>

**<annot>** Provides a statement explaining the text or indicating the basis for an assertion.

<attacca> → model.textPhraseLike.limited → model.annotLike → <annot>

**<bibl>** Provides a loosely-structured bibliographic citation in which the sub-components may or may not be explicitly marked.

<attacca> → model.textPhraseLike.limited → model.biblLike → <bibl>

**<biblStruct>** Contains a bibliographic citation in which bibliographic sub-elements must appear in a specified order.

<attacca> → model.textPhraseLike.limited → model.biblLike → <biblStruct>

**<bloc>** Contains the name of a geopolitical unit consisting of two or more nation states or countries.

<attacca> → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <bloc>

**<catchwords>** Describes the system used to ensure correct ordering of the quires making up an item, typically by means of annotations at the foot of the page.

<attacca> → model.textPhraseLike.limited → model.mslInline → <catchwords>

**<choice>** Groups a number of alternative encodings for the same point in a text.

<attacca> → model.editLike → <choice>

**<corpName>** Identifies an organization or group of people that acts as a single entity.

<attacca> → model.textPhraseLike.limited → model.nameLike → model.nameLike.agent → <corpName>

**<corr>** Contains the correct form of an apparent erroneous passage.

<attacca> → model.transcriptionLike → <corr>

**<country>** Contains the name of a geopolitical unit, such as a nation, country, colony, or commonwealth, larger than or administratively superior to a region and smaller than a bloc.

<attacca> → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <country>

**<curve>** A curved line that cannot be represented by a more specific element, such as a slur.

<attacca> → model.graphicPrimitiveLike → <curve>

**<damage>** Contains an area of damage to the physical medium.

<attacca> → model.transcriptionLike → <damage>

**<date>** A string identifying a point in time or the time period between two such points.

<attacca> → model.textPhraseLike.limited → model.dateLike → <date>

**<dedicatee>** Entity to whom a creative work is formally offered.

<attacca> → model.textPhraseLike.limited → <dedicatee>

**<del>** Contains information deleted, marked as deleted, or otherwise indicated as superfluous or spurious in the copy text by an author, scribe, annotator, or corrector.

<attacca> → model.transcriptionLike → <del>

**<depth>** Description of a measurement taken through a three-dimensional object.

<attacca> → model.textPhraseLike.limited → model.dimLike → <depth>

**<dim>** Any single dimensional specification.

<attacca> → model.textPhraseLike.limited → model.dimLike → <dim>

**<dimensions>** Information about the physical size of an entity; usually includes numerical data.

<attacca> → model.textPhraseLike.limited → <dimensions>

**<district>** Contains the name of any kind of subdivision of a settlement, such as a parish, ward, or other administrative or geographic unit.

<attacca> → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <district>

**<expan>** Contains the expansion of an abbreviation.

<attacca> → model.textPhraseLike.limited → model.editorialLike → <expan>

**<extent>** Used to express size in terms other than physical dimensions, such as number of pages, records, bytes, physical components, etc.

<attacca> → model.textPhraseLike.limited → <extent>

**<fig>** Groups elements representing or containing graphic information such as an illustration or figure.

<attacca> → model.textPhraseLike.limited → model.figureLike → <fig>

**<gap>** Indicates a point where material has been omitted in a transcription, whether as part of sampling practice or for editorial reasons described in the MEI header.

<attacca> → model.transcriptionLike → <gap>

**<geogFeat>** Contains a common noun identifying a geographical feature.

<attacca> → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <geogFeat>

**<geogName>** The proper noun designation for a place, natural feature, or political jurisdiction.

<attacca> → model.textPhraseLike.limited → model.nameLike → model.nameLike.place → model.nameLike.geogName → <geogName>

**<handShift>** Marks the beginning of a passage written in a new hand, or of a change in the scribe, writing style, ink or character of the document hand.

<attacca> → model.transcriptionLike → <handShift>

**<height>** Description of the vertical size of an object.

<attacca> → model.textPhraseLike.limited → model.dimLike → <height>

**<heraldry>** Contains a heraldic formula or phrase, typically found as part of a blazon, coat of arms, etc.

<attacca> → model.textPhraseLike.limited → model.mslinline → <heraldry>

**<identifier>** An alpha-numeric string that establishes the identity of the described material.

<attacca> → model.textPhraseLike.limited → model.identifierLike → <identifier>

**<lb>** An empty formatting element that forces text to begin on a new line.

<attacca> → model.textPhraseLike.limited → model.lbLike → <lb>

**<line>** A visual line that cannot be represented by a more specific; i.e., semantic, element.

<attacca> → model.graphicPrimitiveLike → <line>

**<locus>** Defines a location within a manuscript or manuscript component, usually as a (possibly discontinuous) sequence of folio references.

<attacca> → model.textPhraseLike.limited → model.mslinline → <locus>

**<locusGrp>** Groups locations which together form a distinct but discontinuous item within a manuscript or manuscript part, according to a specific foliation.

<attacca> → model.textPhraseLike.limited → model.mslinline → <locusGrp>

**<name>** Proper noun or noun phrase.

<attacca> → model.textPhraseLike.limited → model.nameLike → <name>

**<num>** Numeric information in any form.

<attacca> → model.textPhraseLike.limited → model.measurementLike → model.numLike → <num>

**<orig>** Contains material which is marked as following the original, rather than being normalized or corrected.

<attacca> → model.transcriptionLike → <orig>

**<periodName>** A label that describes a period of time, such as 'Baroque' or '3rd Style period'.

<attacca> → model.textPhraseLike.limited → model.nameLike.label → <periodName>

**<persName>** Designation for an individual, including any or all of that individual's forenames, surnames, honorific titles, and added names.

<attacca> → model.textPhraseLike.limited → model.nameLike → model.nameLike.agent → <persName>

**<postBox>** (postal box or post office box) contains a number or other identifier for some postal delivery point other than a street address.

<attacca> → model.textPhraseLike.limited → model.addressPart → <postBox>

**<postCode>** (postal code) contains a numerical or alphanumeric code used as part of a postal address to simplify sorting or delivery of mail.

<attacca> → model.textPhraseLike.limited → model.addressPart → <postCode>

**<ptr>** Defines a traversible pointer to another location, using only attributes to describe the destination.

<attacca> → model.textPhraseLike.limited → model.locrefLike → <ptr>

**<q>** Contains material which is distinguished from the surrounding phrase-level text using quotation marks or a similar method. Use <quote> for block-level quotations.

<attacca> → model.textPhraseLike.limited → model.qLike → <q>

**<ref>** Defines a traversible reference to another location. May contain text and sub-elements that describe the destination.

<attacca> → model.textPhraseLike.limited → model.locrefLike → <ref>

**<reg>** Contains material which has been regularized or normalized in some sense.

<attacca> → model.transcriptionLike → <reg>

**<region>** Contains the name of an administrative unit such as a state, province, or county, larger than a settlement, but smaller than a country.

<attacca> → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <region>

**<relation>** Describes a relationship or linkage amongst entities.

<attacca> → model.textPhraseLike.limited → model.relationLike → <relation>

**<relationList>** Gathers relation elements.

<attacca> → model.textPhraseLike.limited → model.relationLike → <relationList>

**<rend>** A formatting element indicating special visual rendering, e.g., bold or italicized, of a text word or phrase.

<attacca> → model.textPhraseLike.limited → model.rendLike → <rend>

**<repository>** Institution, agency, or individual which holds a bibliographic item.

<attacca> → model.textPhraseLike.limited → model.nameLike → model.nameLike.place → model.repositoryLike → <repository>

**<restore>** Indicates restoration of material to an earlier state by cancellation of an editorial or authorial marking or instruction.

<attacca> → model.transcriptionLike → <restore>

**<secFolio>** Marks the word or words taken from a fixed point in a codex (typically the beginning of the second leaf) in order to provide a unique identifier for the item.

<attacca> → model.textPhraseLike.limited → model.mslinline → <secFolio>

**<seg>** (arbitrary segment) represents any segmentation of text below the "text component" level.

<attacca> → model.textPhraseLike.limited → <seg>

**<settlement>** Contains the name of a settlement such as a city, town, or village identified as a single geopolitical or administrative unit.

<attacca> → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <settlement>

**<sic>** Contains apparently incorrect or inaccurate material.

<attacca> → model.transcriptionLike → <sic>

**<signatures>** Provides a description of the leaf or quire signatures found within a codex.

<attacca> → model.textPhraseLike.limited → model.mslinline → <signatures>

**<stack>** An inline table with a single column.

<attacca> → model.textPhraseLike.limited → model.rendLike → <stack>

**<stamp>** Contains a word or phrase describing an official mark indicating ownership, genuineness, validity, etc.

<attacca> → model.textPhraseLike.limited → model.mslinline → <stamp>

**<street>** full street address including any name or number identifying a building as well as the name of the street or route on which it is located.

<attacca> → model.textPhraseLike.limited → model.addressPart → <street>

**<styleName>** A label for a characteristic style of writing or performance, such as 'bebop' or 'rock-n-roll'.

<attacca> → model.textPhraseLike.limited → model.nameLike.label → <styleName>

**<subst>** Groups transcriptional elements when the combination is to be regarded as a single intervention in the text.

<attacca> → model.editLike → <subst>

**<supplied>** Contains material supplied by the transcriber or editor for any reason.

<attacca> → model.transcriptionLike → <supplied>

**<symbol>** A reference to a previously defined symbol.

<attacca> → model.textPhraseLike.limited → <symbol>

**<term>** Keyword or phrase which describes a resource.

<attacca> → model.textPhraseLike.limited → <term>

**<title>** Title of a bibliographic entity.

<attacca> → model.textPhraseLike.limited → model.titleLike → <title>

**<unclear>** Contains material that cannot be transcribed with certainty because it is illegible or inaudible in the source.

<attacca> → model.transcriptionLike → <unclear>

**<watermark>** Contains a description of a watermark or similar device.

<attacca> → model.textPhraseLike.limited → model.mslInLine → <watermark>

**<width>** Description of the horizontal size of an object.

<attacca> → model.textPhraseLike.limited → model.dimLike → <width>

## Remarks

As a specialized directive, **<attacca>** is a control element. That is, it can be linked via its attributes to other events. The starting point of the attacca directive may be indicated by either a startid, tstamp, tstamp.ges, or tstamp.real attribute, while the ending point may be recorded by either a dur, dur.ges, endid, or tstamp2 attribute. It is a semantic error not to specify a starting point attribute.

## Constraints

Must have one of the attributes: startid, tstamp, tstamp.ges or tstamp.real.

## Declaration

```

## <audience>

Defines the class of user for which the work is intended, as defined by age group (e.g., children, young adults, adults, etc.), educational level (e.g., primary, secondary, etc.), or other categorization.

### Referenced in chapters

[3.5.1 FRBR Entities in MEI](#), [3.6 Work Description](#), [3.6.8 Audience and Context](#)

### Module

[MEI.header](#)

### Attributes

**@analog** (*optional*) Contains a reference to a field or element in another descriptive encoding system to which this MEI element is comparable. Value is plain text.

<audience> → [att.bibl](#) → @analog

**@auth** (*optional*) A name or label associated with a controlled vocabulary or other authoritative source for this element or its content. Value is plain text.

<audience> → [att.authorized](#) → @auth

**@auth.uri** (*optional*) A web-accessible location of the controlled vocabulary or other authoritative source of identification or definition for this element or its content. This attribute may contain a complete URI or a partial URI which is completed by the value of the codedval attribute. Value conforms to [data.URI](#).  
<audience> → [att.authorized](#) → @auth.uri

**@class** (*optional*) Contains one or more URIs which denote classification terms that apply to the entity bearing this attribute. One or more values from [data.URI](#), separated by spaces.

<audience> → [att.common](#) → [att.typed](#) → [att.classed](#) → @class

**@codedval** (*optional*) A value that represents or identifies other data. Often, it is a primary key in the database or a unique value in the coded list identified by the auth or auth.uri attributes. One or more values of datatype **NMTOKEN**, separated by spaces.

<audience> → [att.authorized](#) → [att.canonical](#) → @codedval

**@copyof** (*optional*) Points to an element of which the current element is a copy. Value conforms to [data.URI](#).

<audience> → [att.common](#) → [att.linkin](#) → @copyof

**@corresp** (*optional*) Used to point to other elements that correspond to this one in a generic fashion. One or more values from [data.URI](#), separated by spaces.

<audience> → [att.common](#) → [att.linkin](#) → @corresp

**@follows** (*optional*) points to one or more events in a user-defined collection that are known to be predecessors of the current element. One or more values from [data.URI](#), separated by spaces.

<audience> → [att.common](#) → [att.linkin](#) → @follows

**@label** (*optional*) Captures text to be used to generate a label for the element to which it's attached, a "tool tip" or prefatory text, for example. Should not be used to record document content. Value is plain text.

<audience> → [att.common](#) → [att.labelled](#) → @label

**@on** (*optional*) Provides a number-like designation that indicates an element's position in a sequence of similar elements. May not contain space characters. Value conforms to [data.WORD](#).

<audience> → att.common → att.nNumberLike → @on

**@next** (*optional*) Used to point to the next event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<audience> → att.common → att.linkin → @next

**@precedes** (*optional*) Points to one or more events in a user-defined collection that are known to be successors of the current element. One or more values from [data.URI](#), separated by spaces.

<audience> → att.common → att.linkin → @precedes

**@prev** (*optional*) Points to the previous event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<audience> → att.common → att.linkin → @prev

**@resp** (*optional*) Indicates the agent(s) responsible for some aspect of the text's transcription, editing, or encoding. Its value must point to one or more identifiers declared in the document header. One or more values from [data.URI](#), separated by spaces.

<audience> → att.common → att.responsibility → @resp

**@sameas** (*optional*) Points to an element that is the same as the current element but is not a literal copy of the current element. One or more values from [data.URI](#), separated by spaces.

<audience> → att.common → att.linkin → @sameas

**@synch** (*optional*) Points to elements that are synchronous with the current element. One or more values from [data.URI](#), separated by spaces.

<audience> → att.common → att.linkin → @synch

**@translit** (*optional*) Specifies the transliteration technique used. Value is a [NMTOKEN](#).

<audience> → att.lang → @translit

**@type** (*optional*) Designation which characterizes the element in some sense, using any convenient classification scheme or typology that employs single-token labels. One or more values of datatype [NMTOKEN](#), separated by spaces.

<audience> → att.common → att.typed → @type

**@xml:base** (*optional*) Provides a base URI reference with which applications can resolve relative URI references into absolute URI references. Value conforms to [data.URI](#).

<audience> → att.common → att.basic → @xml:base

**@xml:id** (*optional*) Regularizes the naming of an element and thus facilitates building links between it and other resources. Each id attribute within a document must have a unique value. Value is a valid [xml:id](#).

<audience> → att.common → att.basic → att.id → @xml:id

**@xml:lang** (*optional*) Identifies the language of the element's content. The values for this attribute are language 'tags' as defined in BCP 47. All language tags that make use of private use sub-tags must be documented in a corresponding language element in the MEI header whose id attribute is the same as the language tag's value. Value is a [language](#).

<audience> → att.lang → @xml:lang

## Member of

(audience isn't member of any model class)

## Contained By

**<work>** Provides a detailed description of a work — a distinct intellectual or artistic creation — specifically its history, language use, and high-level musical attributes (e.g., key, tempo, meter, medium of performance, and intended duration).

<audience> → elements having audience as direct children → <work>

## May Contain

**<abbr>** A generic element for 1) a shortened form of a word, including an acronym or 2) a shorthand notation.

<audience> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.editorialLike → <abbr>

**<address>** Contains a postal address, for example of a publisher, an organization, or an individual.

<audience> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.addressLike → <address>

**<annot>** Provides a statement explaining the text or indicating the basis for an assertion.

<audience> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.annotLike → <annot>

**<bibl>** Provides a loosely-structured bibliographic citation in which the sub-components may or may not be explicitly marked.

<audience> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.biblLike → <bibl>

**<biblStruct>** Contains a bibliographic citation in which bibliographic sub-elements must appear in a specified order.

<audience> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.biblLike → <biblStruct>

**<bloc>** Contains the name of a geopolitical unit consisting of two or more nation states or countries.

<audience> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <bloc>

**<catchwords>** Describes the system used to ensure correct ordering of the quires making up an item, typically by means of annotations at the foot of the page.

<audience> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.mslInline → <catchwords>

**<corpName>** Identifies an organization or group of people that acts as a single entity.

<audience> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.nameLike → model.nameLike.agent → <corpName>

**<country>** Contains the name of a geopolitical unit, such as a nation, country, colony, or commonwealth, larger than or administratively superior to a region and smaller than a bloc.

<audience> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <country>

**<date>** A string identifying a point in time or the time period between two such points.

<audience> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.dateLike → <date>

**<dedictee>** Entity to whom a creative work is formally offered.

<audience> → macro.struc-unstrucContent → model.textPhraseLike.limited → <dedictee>

**<depth>** Description of a measurement taken through a three-dimensional object.

<audience> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.dimLike → <depth>

**<dim>** Any single dimensional specification.

<audience> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.dimLike → <dim>

**<dimensions>** Information about the physical size of an entity; usually includes numerical data.

<audience> → macro.struc-unstrucContent → model.textPhraseLike.limited → <dimensions>

**<district>** Contains the name of any kind of subdivision of a settlement, such as a parish, ward, or other administrative or geographic unit.

<audience> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <district>

**<expan>** Contains the expansion of an abbreviation.

<audience> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.editorialLike → <expan>

**<extent>** Used to express size in terms other than physical dimensions, such as number of pages, records, bytes, physical components, etc.

<audience> → macro.struc-unstrucContent → model.textPhraseLike.limited → <extent>

**<fig>** Groups elements representing or containing graphic information such as an illustration or figure.

<audience> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.figureLike → <fig>

**<geogFeat>** Contains a common noun identifying a geographical feature.

<audience> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <geogFeat>

**<geogName>** The proper noun designation for a place, natural feature, or political jurisdiction.

<audience> → macro.struc-

unstrucContent → model.textPhraseLike.limited → model.nameLike → model.nameLike.place → model.nameLike.geogName → <geogName>

**<head>** Contains any heading, for example, the title of a section of text, or the heading of a list.

<audience> → macro.struc-unstrucContent → model.headLike → <head>

**<height>** Description of the vertical size of an object.

<audience> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.dimLike → <height>

**<heraldry>** Contains a heraldic formula or phrase, typically found as part of a blazon, coat of arms, etc.

<audience> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.mslinline → <heraldry>

**<identifier>** An alpha-numeric string that establishes the identity of the described material.

<audience> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.identifierLike → <identifier>

**<lb>** An empty formatting element that forces text to begin on a new line.

<audience> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.lbLike → <lb>

**<locus>** Defines a location within a manuscript or manuscript component, usually as a (possibly discontinuous) sequence of folio references.

<audience> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.mslinline → <locus>

**<locusGrp>** Groups locations which together form a distinct but discontinuous item within a manuscript or manuscript part, according to a specific foliation.

<audience> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.mslinline → <locusGrp>

**<name>** Proper noun or noun phrase.

<audience> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.nameLike → <name>

**<num>** Numeric information in any form.

<audience> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.measurementLike → model.numLike → <num>

**<p>** One or more text phrases that form a logical prose passage.

<audience> → macro.struc-unstrucContent → model.pLike → <p>

**<periodName>** A label that describes a period of time, such as 'Baroque' or '3rd Style period'.

<audience> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.nameLike.label → <periodName>

**<persName>** Designation for an individual, including any or all of that individual's forenames, surnames, honorific titles, and added names.

<audience> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.nameLike → model.nameLike.agent → <persName>

**<postBox>** (postal box or post office box) contains a number or other identifier for some postal delivery point other than a street address.

<audience> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.addressPart → <postBox>

**<postCode>** (postal code) contains a numerical or alphanumeric code used as part of a postal address to simplify sorting or delivery of mail.

<audience> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.addressPart → <postCode>

**<ptr>** Defines a traversible pointer to another location, using only attributes to describe the destination.

<audience> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.locrefLike → <ptr>

**<q>** Contains material which is distinguished from the surrounding phrase-level text using quotation marks or a similar method. Use **<quote>** for block-level quotations.

<audience> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.qLike → <q>

**<ref>** Defines a traversible reference to another location. May contain text and sub-elements that describe the destination.

<audience> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.locrefLike → <ref>

**<region>** Contains the name of an administrative unit such as a state, province, or county, larger than a settlement, but smaller than a country.

<audience> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <region>

**<relation>** Describes a relationship or linkage amongst entities.

<audience> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.relationLike → <relation>

**<relationList>** Gathers relation elements.

<audience> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.relationLike → <relationList>

**<rend>** A formatting element indicating special visual rendering, e.g., bold or italicized, of a text word or phrase.

<audience> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.rendLike → <rend>

**<repository>** Institution, agency, or individual which holds a bibliographic item.

<audience> → macro.struc-

unstrucContent → model.textPhraseLike.limited → model.nameLike → model.nameLike.place → model.repositoryLike → <repository>

**<secFolio>** Marks the word or words taken from a fixed point in a codex (typically the beginning of the second leaf) in order to provide a unique identifier for the item.

<audience> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.mslinline → <secFolio>

**<seg>** (arbitrary segment) represents any segmentation of text below the "text component" level.

<audience> → macro.struc-unstrucContent → model.textPhraseLike.limited → <seg>

**<settlement>** Contains the name of a settlement such as a city, town, or village identified as a single geopolitical or administrative unit.

<audience> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <settlement>

**<signatures>** Provides a description of the leaf or quire signatures found within a codex.

<audience> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.mslinline → <signatures>

**<stack>** An inline table with a single column.

<audience> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.rendLike → <stack>

**<stamp>** Contains a word or phrase describing an official mark indicating ownership, genuineness, validity, etc.

<audience> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.mslinline → <stamp>

**<street>** full street address including any name or number identifying a building as well as the name of the street or route on which it is located.

<audience> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.addressPart → <street>

**<styleName>** A label for a characteristic style of writing or performance, such as 'bebop' or 'rock-n-roll'.

<audience> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.nameLike.label → <styleName>

**<symbol>** A reference to a previously defined symbol.

<audience> → macro.struc-unstrucContent → model.textPhraseLike.limited → <symbol>

**<term>** Keyword or phrase which describes a resource.

<audience> → macro.struc-unstrucContent → model.textPhraseLike.limited → <term>

**<title>** Title of a bibliographic entity.

<audience> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.titleLike → <title>

**<watermark>** Contains a description of a watermark or similar device.

<audience> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.msInline → <watermark>

**<width>** Description of the horizontal size of an object.

<audience> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.dimLike → <width>

## Declaration

```

<elementSpec ident="audience" module="MEI.header">
  <desc xml:lang="en">Defines the class of user for which the work is intended, as defined
  by age group (
    <abbr>e.g.</abbr>
    , children, young adults, adults, etc.), educational level (
    <abbr>e.g.</abbr>
    , primary, secondary, etc.), or other categorization.</desc>

</elementSpec>

```

## <author>

The name of the creator of the intellectual content of a non-musical, literary work.

### Referenced in chapters

[3.3.1 Title Statement](#), [3.6.1 Work Identification](#), [9.2.12 Bibliographic Citations and References](#)

### Module

[MEI.shared](#)

### Attributes

**@analog** (*optional*) Contains a reference to a field or element in another descriptive encoding system to which this MEI element is comparable. Value is plain text.

<author> → [att.bibl](#) → @analog

**@cert** (*optional*) Signifies the degree of certainty or precision associated with a feature. Value conforms to [data.CERTAINTY](#).

<author> → [att.evidence](#) → @cert

**@class** (*optional*) Contains one or more URIs which denote classification terms that apply to the entity bearing this attribute. One or more values from [data.URI](#), separated by spaces.

<author> → [att.common](#) → [att.typed](#) → [att.classed](#) → @class

**@copyof** (*optional*) Points to an element of which the current element is a copy. Value conforms to [data.URI](#).

<author> → [att.common](#) → [att.linkin](#) → @copyof

**@corresp** (*optional*) Used to point to other elements that correspond to this one in a generic fashion. One or more values from [data.URI](#), separated by spaces.

<author> → [att.common](#) → [att.linkin](#) → @corresp

**@evidence** (*optional*) Indicates the nature of the evidence supporting the reliability or accuracy of the intervention or interpretation. Allowed values are: "**internal**" (*There is evidence within the document to support the intervention.*), "**external**" (*There is evidence outside the document to support the intervention.*), "**conjecture**" (*The assertion has been made by the editor, cataloguer, or scholar on the basis of their expertise.*)

<author> → [att.evidence](#) → @evidence

**@facsimile** (*optional*) Points to one or more images, portions of an image, or surfaces which correspond to the current element. One or more values from [data.URI](#), separated by spaces.

<author> → [att.facsimile](#) → @facsimile

**@follows** (*optional*) points to one or more events in a user-defined collection that are known to be predecessors of the current element. One or more values from [data.URI](#), separated by spaces.

<author> → [att.common](#) → [att.linkin](#) → @follows

**@label** (*optional*) Captures text to be used to generate a label for the element to which it's attached, a "tool tip" or prefatory text, for example. Should not be used to record document content. Value is plain text.

<author> → [att.common](#) → [att.labelled](#) → @label

**@n** (*optional*) Provides a number-like designation that indicates an element's position in a sequence of similar elements. May not contain space characters. Value conforms to [data.WORD](#).

<author> → att.common → att.nNumberLike → @n

**@next** (*optional*) Used to point to the next event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<author> → att.common → att.linking → @next

**@precedes** (*optional*) Points to one or more events in a user-defined collection that are known to be successors of the current element. One or more values from [data.URI](#), separated by spaces.

<author> → att.common → att.linking → @precedes

**@prev** (*optional*) Points to the previous event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<author> → att.common → att.linking → @prev

**@resp** (*optional*) Indicates the agent(s) responsible for some aspect of the text's transcription, editing, or encoding. Its value must point to one or more identifiers declared in the document header. One or more values from [data.URI](#), separated by spaces.

<author> → att.common → att.responsibility → @resp

**@sameas** (*optional*) Points to an element that is the same as the current element but is not a literal copy of the current element. One or more values from [data.URI](#), separated by spaces.

<author> → att.common → att.linking → @sameas

**@synch** (*optional*) Points to elements that are synchronous with the current element. One or more values from [data.URI](#), separated by spaces.

<author> → att.common → att.linking → @synch

**@translit** (*optional*) Specifies the transliteration technique used. Value is a [NMTOKEN](#).

<author> → att.lang → @translit

**@type** (*optional*) Designation which characterizes the element in some sense, using any convenient classification scheme or typology that employs single-token labels. One or more values of datatype [NMTOKEN](#), separated by spaces.

<author> → att.common → att.typed → @type

**@xml:base** (*optional*) Provides a base URI reference with which applications can resolve relative URI references into absolute URI references. Value conforms to [data.URI](#).

<author> → att.common → att.basic → @xml:base

**@xml:id** (*optional*) Regularizes the naming of an element and thus facilitates building links between it and other resources. Each id attribute within a document must have a unique value. Value is a valid [xml:id](#).

<author> → att.common → att.basic → att.id → @xml:id

**@xml:lang** (*optional*) Identifies the language of the element's content. The values for this attribute are language 'tags' as defined in BCP 47. All language tags that make use of private use sub-tags must be documented in a corresponding language element in the MEI header whose id attribute is the same as the language tag's value. Value is a [language](#).

<author> → att.lang → @xml:lang

## Member of

[model.respLikePart](#) Groups elements that delineate particular responsibilities as opposed to the respStmt element that provides for generic statements of responsibility.

## Contained By

**<analytic>** Contains bibliographic elements describing an item (e.g., an article or poem) published within a monograph or journal and not as an independent publication.

<author> → [model.respLikePart](#) → <analytic>

**<bibl>** Provides a loosely-structured bibliographic citation in which the sub-components may or may not be explicitly marked.

<author> → [model.respLikePart](#) → [model.respLike](#) → [model.biblPart](#) → <bibl>

**<byline>** Contains the primary statement of responsibility given for a work on its title page.

<author> → [model.respLikePart](#) → <byline>

**<editionStmt>** Container for meta-data pertaining to a particular edition of the material being described.

<author> → [model.respLikePart](#) → <editionStmt>

**<expression>** Intellectual or artistic realization of a work.

<author> → [model.respLikePart](#) → <expression>

**<monogr>** Contains bibliographic elements describing an item, for example, a published book or journal, score, recording, or an unpublished manuscript.

<author> → [model.respLikePart](#) → <monogr>

**<seriesStmt>** Groups information about the series, if any, to which a publication belongs.

<author> → [model.respLikePart](#) → <seriesStmt>

**<titlePage>** Contains a transcription of the title page of a text.

<author> → [model.respLikePart](#) → [model.titlePagePart](#) → <titlePage>

**<titleStmt>** Container for title and responsibility meta-data.

<author> → [model.respLikePart](#) → [model.respLike](#) → <titleStmt>

**<work>** Provides a detailed description of a work — a distinct intellectual or artistic creation — specifically its history, language use, and high-level musical attributes (e.g., key, tempo, meter, medium of performance, and intended duration).

<author> → [model.respLikePart](#) → <work>

## May Contain

**<abbr>** A generic element for 1) a shortened form of a word, including an acronym or 2) a shorthand notation.

<author> → [model.textPhraseLike.limited](#) → [model.editorialLike](#) → <abbr>

**<address>** Contains a postal address, for example of a publisher, an organization, or an individual.

<author> → [model.textPhraseLike.limited](#) → [model.addressLike](#) → <address>

**<annot>** Provides a statement explaining the text or indicating the basis for an assertion.

<author> → [model.textPhraseLike.limited](#) → [model.annotLike](#) → <annot>

**<bibl>** Provides a loosely-structured bibliographic citation in which the sub-components may or may not be explicitly marked.

<author> → [model.textPhraseLike.limited](#) → [model.biblLike](#) → <bibl>

**<biblStruct>** Contains a bibliographic citation in which bibliographic sub-elements must appear in a specified order.

<author> → [model.textPhraseLike.limited](#) → [model.biblLike](#) → <biblStruct>

- <bloc>** Contains the name of a geopolitical unit consisting of two or more nation states or countries.  
<author> → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <bloc>
- <catchwords>** Describes the system used to ensure correct ordering of the quires making up an item, typically by means of annotations at the foot of the page.  
<author> → model.textPhraseLike.limited → model.msInline → <catchwords>
- <corpName>** Identifies an organization or group of people that acts as a single entity.  
<author> → model.textPhraseLike.limited → model.nameLike → model.nameLike.agent → <corpName>
- <country>** Contains the name of a geopolitical unit, such as a nation, country, colony, or commonwealth, larger than or administratively superior to a region and smaller than a bloc.  
<author> → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <country>
- <date>** A string identifying a point in time or the time period between two such points.  
<author> → model.textPhraseLike.limited → model.dateLike → <date>
- <dedicatee>** Entity to whom a creative work is formally offered.  
<author> → model.textPhraseLike.limited → <dedicatee>
- <depth>** Description of a measurement taken through a three-dimensional object.  
<author> → model.textPhraseLike.limited → model.dimLike → <depth>
- <dim>** Any single dimensional specification.  
<author> → model.textPhraseLike.limited → model.dimLike → <dim>
- <dimensions>** Information about the physical size of an entity; usually includes numerical data.  
<author> → model.textPhraseLike.limited → <dimensions>
- <district>** Contains the name of any kind of subdivision of a settlement, such as a parish, ward, or other administrative or geographic unit.  
<author> → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <district>
- <expan>** Contains the expansion of an abbreviation.  
<author> → model.textPhraseLike.limited → model.editorialLike → <expan>
- <extent>** Used to express size in terms other than physical dimensions, such as number of pages, records, bytes, physical components, etc.  
<author> → model.textPhraseLike.limited → <extent>
- <fig>** Groups elements representing or containing graphic information such as an illustration or figure.  
<author> → model.textPhraseLike.limited → model.figureLike → <fig>
- <geogFeat>** Contains a common noun identifying a geographical feature.  
<author> → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <geogFeat>
- <geogName>** The proper noun designation for a place, natural feature, or political jurisdiction.  
<author> → model.textPhraseLike.limited → model.nameLike → model.nameLike.place → model.nameLike.geogName → <geogName>
- <height>** Description of the vertical size of an object.  
<author> → model.textPhraseLike.limited → model.dimLike → <height>
- <heraldry>** Contains a heraldic formula or phrase, typically found as part of a blazon, coat of arms, etc.  
<author> → model.textPhraseLike.limited → model.msInline → <heraldry>
- <identifier>** An alpha-numeric string that establishes the identity of the described material.  
<author> → model.textPhraseLike.limited → model.identifierLike → <identifier>
- <lb>** An empty formatting element that forces text to begin on a new line.

<author> → model.textPhraseLike.limited → model.lbLike → <lb>

**<locus>** Defines a location within a manuscript or manuscript component, usually as a (possibly discontinuous) sequence of folio references.

<author> → model.textPhraseLike.limited → model.msInLine → <locus>

**<locusGrp>** Groups locations which together form a distinct but discontinuous item within a manuscript or manuscript part, according to a specific foliation.

<author> → model.textPhraseLike.limited → model.msInLine → <locusGrp>

**<name>** Proper noun or noun phrase.

<author> → model.textPhraseLike.limited → model.nameLike → <name>

**<num>** Numeric information in any form.

<author> → model.textPhraseLike.limited → model.measurementLike → model.numLike → <num>

**<periodName>** A label that describes a period of time, such as 'Baroque' or '3rd Style period'.

<author> → model.textPhraseLike.limited → model.nameLike.label → <periodName>

**<persName>** Designation for an individual, including any or all of that individual's forenames, surnames, honorific titles, and added names.

<author> → model.textPhraseLike.limited → model.nameLike → model.nameLike.agent → <persName>

**<postBox>** (postal box or post office box) contains a number or other identifier for some postal delivery point other than a street address.

<author> → model.textPhraseLike.limited → model.addressPart → <postBox>

**<postCode>** (postal code) contains a numerical or alphanumeric code used as part of a postal address to simplify sorting or delivery of mail.

<author> → model.textPhraseLike.limited → model.addressPart → <postCode>

**<ptr>** Defines a traversible pointer to another location, using only attributes to describe the destination.

<author> → model.textPhraseLike.limited → model.locrefLike → <ptr>

**<q>** Contains material which is distinguished from the surrounding phrase-level text using quotation marks or a similar method. Use <quote> for block-level quotations.

<author> → model.textPhraseLike.limited → model.qLike → <q>

**<ref>** Defines a traversible reference to another location. May contain text and sub-elements that describe the destination.

<author> → model.textPhraseLike.limited → model.locrefLike → <ref>

**<region>** Contains the name of an administrative unit such as a state, province, or county, larger than a settlement, but smaller than a country.

<author> → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <region>

**<relation>** Describes a relationship or linkage amongst entities.

<author> → model.textPhraseLike.limited → model.relationLike → <relation>

**<relationList>** Gathers relation elements.

<author> → model.textPhraseLike.limited → model.relationLike → <relationList>

**<rend>** A formatting element indicating special visual rendering, e.g., bold or italicized, of a text word or phrase.

<author> → model.textPhraseLike.limited → model.rendLike → <rend>

**<repository>** Institution, agency, or individual which holds a bibliographic item.

<author> → model.textPhraseLike.limited → model.nameLike → model.nameLike.place → model.repositoryLike → <repository>

**<secFolio>** Marks the word or words taken from a fixed point in a codex (typically the beginning of the second leaf) in order to provide a unique identifier for the item.

<author> → model.textPhraseLike.limited → model.msInLine → <secFolio>

**<seg>** (arbitrary segment) represents any segmentation of text below the "text component" level.

<author> → model.textPhraseLike.limited → <seg>

**<settlement>** Contains the name of a settlement such as a city, town, or village identified as a single geopolitical or administrative unit.

<author> → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <settlement>

**<signatures>** Provides a description of the leaf or quire signatures found within a codex.

<author> → model.textPhraseLike.limited → model.msInLine → <signatures>

**<stack>** An inline table with a single column.

<author> → model.textPhraseLike.limited → model.rendLike → <stack>

**<stamp>** Contains a word or phrase describing an official mark indicating ownership, genuineness, validity, etc.

<author> → model.textPhraseLike.limited → model.msInLine → <stamp>

**<street>** full street address including any name or number identifying a building as well as the name of the street or route on which it is located.

<author> → model.textPhraseLike.limited → model.addressPart → <street>

**<styleName>** A label for a characteristic style of writing or performance, such as 'bebop' or 'rock-n-roll'.

<author> → model.textPhraseLike.limited → model.nameLike.label → <styleName>

**<symbol>** A reference to a previously defined symbol.

<author> → model.textPhraseLike.limited → <symbol>

**<term>** Keyword or phrase which describes a resource.

<author> → model.textPhraseLike.limited → <term>

**<title>** Title of a bibliographic entity.

<author> → model.textPhraseLike.limited → model.titleLike → <title>

**<watermark>** Contains a description of a watermark or similar device.

<author> → model.textPhraseLike.limited → model.msInLine → <watermark>

**<width>** Description of the horizontal size of an object.

<author> → model.textPhraseLike.limited → model.dimLike → <width>

## Remarks

The model of this element is based on the [author](#) element of the Text Encoding Initiative (TEI) and the [author](#) element of the Encoded Archival Description (EAD).

## Declaration

### Referenced in chapters

[12.2.1 Overview](#)

### Module

[MEI.performance](#)

### Attributes

**@analog** (*optional*) Contains a reference to a field or element in another descriptive encoding system to which this MEI element is comparable. Value is plain text.

<avFile> → [att.bibl](#) → @analog

**@class** (*optional*) Contains one or more URIs which denote classification terms that apply to the entity bearing this attribute. One or more values from [data.URI](#), separated by spaces.

<avFile> → [att.common](#) → [att.typed](#) → [att.classed](#) → @class

**@copyof** (*optional*) Points to an element of which the current element is a copy. Value conforms to [data.URI](#).

<avFile> → [att.common](#) → [att.linking](#) → @copyof

**@corresp** (*optional*) Used to point to other elements that correspond to this one in a generic fashion. One or more values from [data.URI](#), separated by spaces.

<avFile> → [att.common](#) → [att.linking](#) → @corresp

**@decls** (*optional*) Identifies one or more metadata elements (other than classification terms) within the header, which are understood to apply to the element bearing this attribute and its content. One or more values from [data.URI](#), separated by spaces.

<avFile> → [att.metadataPointing](#) → @decls

**@facs** (*optional*) Points to one or more images, portions of an image, or surfaces which correspond to the current element. One or more values from [data.URI](#), separated by spaces.

<avFile> → [att.facsimile](#) → @facs

**@follows** (*optional*) points to one or more events in a user-defined collection that are known to be predecessors of the current element. One or more values from [data.URI](#), separated by spaces.

<avFile> → [att.common](#) → [att.linking](#) → @follows

**@label** (*optional*) Captures text to be used to generate a label for the element to which it's attached, a "tool tip" or prefatory text, for example. Should not be used to record document content. Value is plain text.

<avFile> → [att.common](#) → [att.labelled](#) → @label

**@mimetype** (*optional*) Specifies the applicable MIME (multimedia internet mail extension) type. The value should be a valid MIME media type defined by the Internet Engineering Task Force in RFC 2046. Value is plain text.

<avFile> → [att.internetMedia](#) → @mimetype

**@n** (*optional*) Provides a number-like designation that indicates an element's position in a sequence of similar elements. May not contain space characters. Value conforms to [data.WORD](#).

<avFile> → att.common → att.nNumberLike → @n

**@next** (*optional*) Used to point to the next event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<avFile> → att.common → att.linking → @next

**@precedes** (*optional*) Points to one or more events in a user-defined collection that are known to be successors of the current element. One or more values from [data.URI](#), separated by spaces.

<avFile> → att.common → att.linking → @precedes

**@prev** (*optional*) Points to the previous event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<avFile> → att.common → att.linking → @prev

**@resp** (*optional*) Indicates the agent(s) responsible for some aspect of the text's transcription, editing, or encoding. Its value must point to one or more identifiers declared in the document header. One or more values from [data.URI](#), separated by spaces.

<avFile> → att.common → att.responsibility → @resp

**@sameas** (*optional*) Points to an element that is the same as the current element but is not a literal copy of the current element. One or more values from [data.URI](#), separated by spaces.

<avFile> → att.common → att.linking → @sameas

**@synch** (*optional*) Points to elements that are synchronous with the current element. One or more values from [data.URI](#), separated by spaces.

<avFile> → att.common → att.linking → @synch

**@target** (*optional*) Identifies passive participants in a relationship; that is, the entities pointed "to". One or more values from [data.URI](#), separated by spaces.

<avFile> → att.pointing → @target

**@targettype** (*optional*) Characterization of target resource(s) using any convenient classification scheme or typology. Value is a [NMTOKEN](#).

<avFile> → att.pointing → @targettype

**@type** (*optional*) Designation which characterizes the element in some sense, using any convenient classification scheme or typology that employs single-token labels. One or more values of datatype [NMTOKEN](#), separated by spaces.

<avFile> → att.common → att.typed → @type

**@xlink:actuate** (*optional*) Defines whether a link occurs automatically or must be requested by the user. Allowed values are: "**onLoad**" (*Load the target resource(s) immediately.*), "**onRequest**" (*Load the target resource(s) upon user request.*), "**none**" (*Do not permit loading of the target resource(s).*), "**other**" (*Behavior other than allowed by the other values of this attribute.*)

<avFile> → att.pointing → @xlink:actuate

**@xlink:role** (*optional*) Characterization of the relationship between resources. The value of the role attribute must be a URI. Value conforms to [data.URI](#).

<avFile> → att.pointing → @xlink:role

**@xlink:show** (*optional*) Defines how a remote resource is rendered. Allowed values are: "**new**" (*Open in a new window.*), "**replace**" (*Load the referenced resource in the same window.*), "**embed**" (*Embed the referenced resource at the point of the link.*), "**none**" (*Do not permit traversal to the referenced resource.*), "**other**" (*Behavior other than permitted by the other values of this attribute.*)

<avFile> → att.pointing → @xlink:show

**@xml:base** (*optional*) Provides a base URI reference with which applications can resolve relative URI references into absolute URI references. Value conforms to [data.URI](#).

<avFile> → att.common → att.basic → @xml:base

**@xml:id** (*optional*) Regularizes the naming of an element and thus facilitates building links between it and other resources. Each id attribute within a document must have a unique value. Value is a valid [xml:id](#).

<avFile> → att.common → att.basic → att.id → @xml:id

## Member of

(avFile isn't member of any model class)

## Contained By

**<clip>** Defines a time segment of interest within a recording or within a digital audio or video file.

<avFile> → elements having avFile as direct children → <clip>

**<recording>** A recorded performance.

<avFile> → elements having avFile as direct children → <recording>

## May Contain

**<clip>** Defines a time segment of interest within a recording or within a digital audio or video file.

<avFile> → direct children → <clip>

## Remarks

This element is analogous to the [<graphic>](#) element in the figtable module.

## Constraints

An avFile child of clip cannot have children.

## Declaration

```

## <availability>

Groups elements that describe the availability of and access to a bibliographic item, including an MEI-encoded document.

### Referenced in chapters

[3.4.1.3 Publication, Distribution, etc.](#), [3.7 Encoding Sources in MEI](#)

### Module

[MEI.header](#)

### Attributes

**@analog** (*optional*) Contains a reference to a field or element in another descriptive encoding system to which this MEI element is comparable. Value is plain text.

<availability> → [att.bibl](#) → @analog

**@class** (*optional*) Contains one or more URIs which denote classification terms that apply to the entity bearing this attribute. One or more values from [data.URI](#), separated by spaces.

<availability> → [att.common](#) → [att.typed](#) → [att.classed](#) → @class

**@copyof** (*optional*) Points to an element of which the current element is a copy. Value conforms to [data.URI](#).

<availability> → [att.common](#) → [att.linking](#) → @copyof

**@corresp** (*optional*) Used to point to other elements that correspond to this one in a generic fashion. One or more values from [data.URI](#), separated by spaces.

<availability> → [att.common](#) → [att.linking](#) → @corresp

**@data** (*optional*) Used to link metadata elements to one or more data-containing elements. One or more values from [data.URI](#), separated by spaces.

<availability> → [att.dataPointing](#) → @data

**@follows** (*optional*) points to one or more events in a user-defined collection that are known to be predecessors of the current element. One or more values from [data.URI](#), separated by spaces.

<availability> → [att.common](#) → [att.linking](#) → @follows

**@label** (*optional*) Captures text to be used to generate a label for the element to which it's attached, a "tool tip" or prefatory text, for example. Should not be used to record document content. Value is plain text.

<availability> → [att.common](#) → [att.labelled](#) → @label

**@n** (*optional*) Provides a number-like designation that indicates an element's position in a sequence of similar elements. May not contain space characters. Value conforms to [data.WORD](#).

<availability> → [att.common](#) → [att.nNumberLike](#) → @n

**@next** (*optional*) Used to point to the next event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<availability> → [att.common](#) → [att.linking](#) → @next

**@precedes** (*optional*) Points to one or more events in a user-defined collection that are known to be successors of the current element. One or more values from [data.URI](#), separated by spaces.

<availability> → [att.common](#) → [att.linking](#) → @precedes

**@prev** (*optional*) Points to the previous event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<availability> → [att.common](#) → [att.linking](#) → @prev

**@resp** (*optional*) Indicates the agent(s) responsible for some aspect of the text's transcription, editing, or encoding. Its value must point to one or more identifiers declared in the document header. One or more values from [data.URI](#), separated by spaces.

<availability> → [att.common](#) → [att.responsibility](#) → @resp

**@sameas** (*optional*) Points to an element that is the same as the current element but is not a literal copy of the current element. One or more values from [data.URI](#), separated by spaces.

<availability> → [att.common](#) → [att.linking](#) → @sameas

**@synch** (*optional*) Points to elements that are synchronous with the current element. One or more values from [data.URI](#), separated by spaces.

<availability> → [att.common](#) → [att.linking](#) → @synch

**@type** (*optional*) Designation which characterizes the element in some sense, using any convenient classification scheme or typology that employs single-token labels. One or more values of datatype **NMTOKEN**, separated by spaces.

<availability> → [att.common](#) → [att.typed](#) → @type

**@xml:base** (*optional*) Provides a base URI reference with which applications can resolve relative URI references into absolute URI references. Value conforms to [data.URI](#).

<availability> → [att.common](#) → [att.basic](#) → @xml:base

**@xml:id** (*optional*) Regularizes the naming of an element and thus facilitates building links between it and other resources. Each id attribute within a document must have a unique value. Value is a valid [xml:id](#).

<availability> → [att.common](#) → [att.basic](#) → [att.id](#) → @xml:id

## Member of

[model.pubStmtPart](#) Groups elements that may appear as part of the publication statement for a bibliographic item.

[model.imprintPart](#) Groups elements that may appear as part of a bibliographic imprint.

## Contained By

**<bibl>** Provides a loosely-structured bibliographic citation in which the sub-components may or may not be explicitly marked.

<availability> → [model.imprintPart](#) → <bibl>

**<imprint>** Information relating to the publication or distribution of a bibliographic item.

<availability> → [model.imprintPart](#) → <imprint>

**<item>** Single instance or exemplar of a source/manifestation.

<availability> → elements having availability as direct children → <item>

**<pubStmt>** Container for information regarding the publication or distribution of a bibliographic item, including the publisher's name and address, the date of publication, and other relevant details.

<availability> → [model.pubStmtPart](#) → <pubStmt>

**<titlePage>** Contains a transcription of the title page of a text.

<availability> → [model.imprintPart](#) → <titlePage>

## May Contain

**<accessRestrict>** Describes the conditions that affect the accessibility of material.

<availability> → macro.availabilityPart → <accessRestrict>

**<address>** Contains a postal address, for example of a publisher, an organization, or an individual.

<availability> → macro.availabilityPart → model.addressLike → <address>

**<date>** A string identifying a point in time or the time period between two such points.

<availability> → macro.availabilityPart → model.dateLike → <date>

**<distributor>** Person or agency, other than a publisher, from which access (including electronic access) to a bibliographic entity may be obtained.

<availability> → macro.availabilityPart → <distributor>

**<head>** Contains any heading, for example, the title of a section of text, or the heading of a list.

<availability> → macro.availabilityPart → model.headLike → <head>

**<identifier>** An alpha-numeric string that establishes the identity of the described material.

<availability> → macro.availabilityPart → model.identifierLike → <identifier>

**<price>** The cost of access to a bibliographic item.

<availability> → macro.availabilityPart → <price>

**<sysReq>** System requirements for using the electronic item.

<availability> → macro.availabilityPart → <sysReq>

**<useRestrict>** Container for information about the conditions that affect use of a bibliographic item after access has been granted.

<availability> → macro.availabilityPart → <useRestrict>

## Remarks

When used within the <fileDesc> element, <availability> indicates access to the MEI-encoded document itself.

The model of this element is based on the availability element of the Text Encoding Initiative (TEI).

## Declaration

```

## <bTrem>

(bowed tremolo) – A rapid alternation on a single pitch or chord.

### Referenced in chapters

[4.3.5 Articulation and Performance Instructions in CMN](#), [4.3.5.3 Tremoland](#)

### Module

[MEI.cmn](#)

### Attributes

**@class** (*optional*) Contains one or more URIs which denote classification terms that apply to the entity bearing this attribute. One or more values from [data.URI](#), separated by spaces.

<bTrem> → [att.common](#) → [att.typed](#) → [att.classed](#) → @class

**@copyof** (*optional*) Points to an element of which the current element is a copy. Value conforms to [data.URI](#).

<bTrem> → [att.common](#) → [att.linkin](#) → @copyof

**@corresp** (*optional*) Used to point to other elements that correspond to this one in a generic fashion. One or more values from [data.URI](#), separated by spaces.

<bTrem> → [att.common](#) → [att.linkin](#) → @corresp

**@dots** (*optional*) Records the number of augmentation dots required by a written dotted duration. Value conforms to [data.AUGMENTDOT](#).

<bTrem> → [att.bTrem.log](#) → [att.augmentDots](#) → @dots

**@dur** (*optional*) Records the duration of a feature using the relative durational values provided by the [data.DURATION](#) datatype. Value conforms to [data.DURATION](#).

<bTrem> → [att.bTrem.log](#) → [att.duration.log](#) → @dur

**@facs** (*optional*) Points to one or more images, portions of an image, or surfaces which correspond to the current element. One or more values from [data.URI](#), separated by spaces.

<bTrem> → [att.facsimile](#) → @facs

**@follows** (*optional*) points to one or more events in a user-defined collection that are known to be predecessors of the current element. One or more values from [data.URI](#), separated by spaces.

<bTrem> → [att.common](#) → [att.linkin](#) → @follows

**@form** (*optional*) Indicates whether the tremolo is measured or unmeasured. Allowed values are:

"**meas**" (*Measured tremolo*), "**unmeas**" (*Unmeasured tremolo*)

<bTrem> → [att.bTrem.log](#) → @form

**@label** (*optional*) Captures text to be used to generate a label for the element to which it's attached, a "tool tip" or prefatory text, for example. Should not be used to record document content. Value is plain text.

<bTrem> → [att.common](#) → [att.labelled](#) → @label

**@layer** (*optional*) Identifies the layer to which a feature applies. One or more values of datatype **positiveInteger**, separated by spaces.

<bTrem> → [att.bTrem.log](#) → [att.event](#) → [att.layerIdent](#) → @layer

**@n** (*optional*) Provides a number-like designation that indicates an element's position in a sequence of similar elements. May not contain space characters. Value conforms to [data.WORD](#).

<bTrem> → att.common → att.nNumberLike → @n

**@next** (*optional*) Used to point to the next event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<bTrem> → att.common → att.linking → @next

**@num** (*optional*) Records a number or count accompanying a notational feature. Value is a positive integer.

<bTrem> → att.bTrem.log → att.numbered → @num

**@num.place** (*optional*) States where the tuplet number will be placed in relation to the note heads. Value conforms to [data.STAFFREL.basic](#).

<bTrem> → att.bTrem.vis → att.numberPlacement → @num.place

**@num.visible** (*optional*) Determines if the tuplet number is visible. Value conforms to [data.BOOLEAN](#).

<bTrem> → att.bTrem.vis → att.numberPlacement → @num.visible

**@precedes** (*optional*) Points to one or more events in a user-defined collection that are known to be successors of the current element. One or more values from [data.URI](#), separated by spaces.

<bTrem> → att.common → att.linking → @precedes

**@prev** (*optional*) Points to the previous event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<bTrem> → att.common → att.linking → @prev

**@resp** (*optional*) Indicates the agent(s) responsible for some aspect of the text's transcription, editing, or encoding. Its value must point to one or more identifiers declared in the document header. One or more values from [data.URI](#), separated by spaces.

<bTrem> → att.common → att.responsibility → @resp

**@sameas** (*optional*) Points to an element that is the same as the current element but is not a literal copy of the current element. One or more values from [data.URI](#), separated by spaces.

<bTrem> → att.common → att.linking → @sameas

**@staff** (*recommended*) Signifies the staff on which a notated event occurs or to which a control event applies. Mandatory when applicable. One or more values of datatype **positiveInteger**, separated by spaces.

<bTrem> → att.bTrem.log → att.event → att.staffIdent → @staff

**@synch** (*optional*) Points to elements that are synchronous with the current element. One or more values from [data.URI](#), separated by spaces.

<bTrem> → att.common → att.linking → @synch

**@tstamp** (*optional*) Encodes the onset time in terms of musical time, i.e., beats[.fractional beat part], as expressed in the written time signature. Value conforms to [data.BEAT](#).

<bTrem> → att.bTrem.log → att.event → att.timestamp.log → @tstamp

**@tstamp.ges** (*optional*) Encodes the onset time in terms of musical time, i.e., beats[.fractional beat part], as expressed in the written time signature. Value conforms to [data.BEAT](#).

<bTrem> → att.bTrem.log → att.event → att.timestamp.ges → @tstamp.ges

**@tstamp.real** (*optional*) Records the onset time in terms of ISO time. Value conforms to [data.ISOTIME](#).

<bTrem> → att.bTrem.log → att.event → att.timestamp.ges → @tstamp.real

**@type** (*optional*) Designation which characterizes the element in some sense, using any convenient classification scheme or typology that employs single-token labels. One or more values of datatype **NMTOKEN**, separated by spaces.

<bTrem> → [att.common](#) → [att.typed](#) → @type

**@unitdur** (*optional*) The performed duration of an individual note in a measured tremolo. Value conforms to [data.DURATION.cmn](#).

<bTrem> → [att.bTrem.ges](#) → [att.tremMeasured](#) → @unitdur

**@when** (*optional*) Indicates the point of occurrence of this feature along a time line. Its value must be the ID of a [<when>](#) element elsewhere in the document. Value conforms to [data.URI](#).

<bTrem> → [att.bTrem.log](#) → [att.event](#) → [att.alignment](#) → @when

**@xml:base** (*optional*) Provides a base URI reference with which applications can resolve relative URI references into absolute URI references. Value conforms to [data.URI](#).

<bTrem> → [att.common](#) → [att.basic](#) → @xml:base

**@xml:id** (*optional*) Regularizes the naming of an element and thus facilitates building links between it and other resources. Each id attribute within a document must have a unique value. Value is a valid [xml:id](#).

<bTrem> → [att.common](#) → [att.basic](#) → [att.id](#) → @xml:id

## Member of

[model.eventLike.cmn](#) Groups events that appear in CMN.

## Contained By

**<abbr>** A generic element for 1) a shortened form of a word, including an acronym or 2) a shorthand notation.

<bTrem> → [model.eventLike.cmn](#) → [model.layerPart.cmn](#) → [model.layerPart](#) → <abbr>

**<add>** Marks an addition to the text.

<bTrem> → [model.eventLike.cmn](#) → [model.layerPart.cmn](#) → [model.layerPart](#) → <add>

**<beam>** A container for a series of explicitly beamed events that begins and ends entirely within a measure.

<bTrem> → [model.eventLike.cmn](#) → <beam>

**<corr>** Contains the correct form of an apparent erroneous passage.

<bTrem> → [model.eventLike.cmn](#) → [model.layerPart.cmn](#) → [model.layerPart](#) → <corr>

**<damage>** Contains an area of damage to the physical medium.

<bTrem> → [model.eventLike.cmn](#) → [model.layerPart.cmn](#) → [model.layerPart](#) → <damage>

**<del>** Contains information deleted, marked as deleted, or otherwise indicated as superfluous or spurious in the copy text by an author, scribe, annotator, or corrector.

<bTrem> → [model.eventLike.cmn](#) → [model.layerPart.cmn](#) → [model.layerPart](#) → <del>

**<expan>** Contains the expansion of an abbreviation.

<bTrem> → [model.eventLike.cmn](#) → [model.layerPart.cmn](#) → [model.layerPart](#) → <expan>

**<graceGrp>** A container for a sequence of grace notes.

<bTrem> → [model.eventLike.cmn](#) → <graceGrp>

**<layer>** An independent stream of events on a staff.

<bTrem> → [model.eventLike.cmn](#) → [model.layerPart.cmn](#) → [model.layerPart](#) → <layer>

**<lem>** (lemma) – Contains the lemma, or base text, of a textual variation.

<bTrem> → model.eventLike.cmn → model.layerPart.cmn → model.layerPart → <lem>

**<oLayer>** A layer that contains an alternative to material in another layer.

<bTrem> → model.eventLike.cmn → model.layerPart.cmn → model.layerPart → <oLayer>

**<orig>** Contains material which is marked as following the original, rather than being normalized or corrected.

<bTrem> → model.eventLike.cmn → model.layerPart.cmn → model.layerPart → <orig>

**<rdg>** (reading) – Contains a single reading within a textual variation.

<bTrem> → model.eventLike.cmn → model.layerPart.cmn → model.layerPart → <rdg>

**<reg>** Contains material which has been regularized or normalized in some sense.

<bTrem> → model.eventLike.cmn → model.layerPart.cmn → model.layerPart → <reg>

**<restore>** Indicates restoration of material to an earlier state by cancellation of an editorial or authorial marking or instruction.

<bTrem> → model.eventLike.cmn → model.layerPart.cmn → model.layerPart → <restore>

**<sic>** Contains apparently incorrect or inaccurate material.

<bTrem> → model.eventLike.cmn → model.layerPart.cmn → model.layerPart → <sic>

**<supplied>** Contains material supplied by the transcriber or editor for any reason.

<bTrem> → model.eventLike.cmn → model.layerPart.cmn → model.layerPart → <supplied>

**<tuplet>** A group of notes with "irregular" (sometimes called "irrational") rhythmic values, for example, three notes in the time normally occupied by two or nine in the time of five.

<bTrem> → model.eventLike.cmn → <tuplet>

**<unclear>** Contains material that cannot be transcribed with certainty because it is illegible or inaudible in the source.

<bTrem> → model.eventLike.cmn → model.layerPart.cmn → model.layerPart → <unclear>

## May Contain

**<chord>** A simultaneous sounding of two or more notes in the same layer \*with the same duration\*.

<bTrem> → direct children → <chord>

**<note>** A single pitched event.

<bTrem> → direct children → <note>

## Declaration

```

DEVELOPMENT  
VERSION

## <back>

(back matter) – Contains any appendixes, advertisements, indexes, etc. following the main body of a musical text.

### Referenced in chapters

[2.1.2 General Music Structure Elements](#), [2.1.3 Document Layout Elements](#), [9.1.2.2 Back Matter](#)

### Module

[MEI.text](#)

### Attributes

**@class** (*optional*) Contains one or more URIs which denote classification terms that apply to the entity bearing this attribute. One or more values from [data.URI](#), separated by spaces.

<back> → att.common → att.typed → att.classed → @class

**@copyof** (*optional*) Points to an element of which the current element is a copy. Value conforms to [data.URI](#).

<back> → att.common → att.linkin → @copyof

**@corresp** (*optional*) Used to point to other elements that correspond to this one in a generic fashion. One or more values from [data.URI](#), separated by spaces.

<back> → att.common → att.linkin → @corresp

**@decls** (*optional*) Identifies one or more metadata elements (other than classification terms) within the header, which are understood to apply to the element bearing this attribute and its content. One or more values from [data.URI](#), separated by spaces.

<back> → att.metadataPointing → @decls

**@facs** (*optional*) Points to one or more images, portions of an image, or surfaces which correspond to the current element. One or more values from [data.URI](#), separated by spaces.

<back> → att.facsimile → @facs

**@follows** (*optional*) points to one or more events in a user-defined collection that are known to be predecessors of the current element. One or more values from [data.URI](#), separated by spaces.

<back> → att.common → att.linkin → @follows

**@label** (*optional*) Captures text to be used to generate a label for the element to which it's attached, a "tool tip" or prefatory text, for example. Should not be used to record document content. Value is plain text.

<back> → att.common → att.labelled → @label

**@n** (*optional*) Provides a number-like designation that indicates an element's position in a sequence of similar elements. May not contain space characters. Value conforms to [data.WORD](#).

<back> → att.common → att.nNumberLike → @n

**@next** (*optional*) Used to point to the next event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<back> → att.common → att.linkin → @next

**@precedes** (*optional*) Points to one or more events in a user-defined collection that are known to be successors of the current element. One or more values from [data.URI](#), separated by spaces.

<back> → att.common → att.linking → @precedes

**@prev** (*optional*) Points to the previous event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<back> → att.common → att.linking → @prev

**@resp** (*optional*) Indicates the agent(s) responsible for some aspect of the text's transcription, editing, or encoding. Its value must point to one or more identifiers declared in the document header. One or more values from [data.URI](#), separated by spaces.

<back> → att.common → att.responsibility → @resp

**@sameas** (*optional*) Points to an element that is the same as the current element but is not a literal copy of the current element. One or more values from [data.URI](#), separated by spaces.

<back> → att.common → att.linking → @sameas

**@synch** (*optional*) Points to elements that are synchronous with the current element. One or more values from [data.URI](#), separated by spaces.

<back> → att.common → att.linking → @synch

**@translit** (*optional*) Specifies the transliteration technique used. Value is a [NMTOKEN](#).

<back> → att.lang → @translit

**@type** (*optional*) Designation which characterizes the element in some sense, using any convenient classification scheme or typology that employs single-token labels. One or more values of datatype [NMTOKEN](#), separated by spaces.

<back> → att.common → att.typed → @type

**@xml:base** (*optional*) Provides a base URI reference with which applications can resolve relative URI references into absolute URI references. Value conforms to [data.URI](#).

<back> → att.common → att.basic → @xml:base

**@xml:id** (*optional*) Regularizes the naming of an element and thus facilitates building links between it and other resources. Each id attribute within a document must have a unique value. Value is a valid [xml:id](#).

<back> → att.common → att.basic → att.id → @xml:id

**@xml:lang** (*optional*) Identifies the language of the element's content. The values for this attribute are language 'tags' as defined in BCP 47. All language tags that make use of private use sub-tags must be documented in a corresponding language element in the MEI header whose id attribute is the same as the language tag's value. Value is a [language](#).

<back> → att.lang → @xml:lang

## Member of

[model.backLike](#) Groups elements that may contain back matter.

## Contained By

### May Contain

**<cb>** An empty formatting element that forces text to begin in a new column.

<back> → [model.milestoneLike.text](#) → <cb>

**<colLayout>** An empty formatting element that signals the start of columnar layout.

<back> → [model.milestoneLike.text](#) → <colLayout>

**<div>** Major structural division of text, such as a preface, chapter or section.

<back> → model.divLike → <div>

**<lb>** An empty formatting element that forces text to begin on a new line.

<back> → model.milestoneLike.text → model.lbLike → <lb>

**<pb>** An empty formatting element that forces text to begin on a new page.

<back> → model.milestoneLike.text → model.pbLike → <pb>

**<relation>** Describes a relationship or linkage amongst entities.

<back> → model.relationLike → <relation>

**<relationList>** Gathers relation elements.

<back> → model.relationLike → <relationList>

**<titlePage>** Contains a transcription of the title page of a text.

<back> → model.frontAndBackPart → <titlePage>

## Remarks

The model of this element is based on the **back** element of the Text Encoding Initiative (TEI).

VERSION

## <barLine>

Vertical line drawn through one or more staves that divides musical notation into metrical units.

### Referenced in chapters

[2.1.2.2 Content of Musical Divisions](#), [2.2.4.2 Bar Lines and Custos Signs](#), [5.5 Music Data Organization](#)

### Module

[MEI.shared](#)

### Attributes

**@altsym** (*optional*) Provides a way of pointing to a user-defined symbol. It must contain a reference to an ID of a [`<symbolDef>`](#) element elsewhere in the document. Value conforms to [data.URI](#).

`<barLine> → att.barLine.vis → att.altSym → @altsym`

**@class** (*optional*) Contains one or more URIs which denote classification terms that apply to the entity bearing this attribute. One or more values from [data.URI](#), separated by spaces.

`<barLine> → att.common → att.typed → att.classed → @class`

**@color** (*optional*) Used to indicate visual appearance. Do not confuse this with the musical term 'color' as used in pre-CMN notation. Value conforms to [data.COLOR](#).

`<barLine> → att.barLine.vis → att.color → @color`

**@control** (*optional*) Indicates whether or not a bar line is "controlling"; that is, if it indicates a point of alignment across all the parts. Bar lines within a score are usually controlling; that is, they "line up". Bar lines within parts may or may not be controlling. When applied to [`<measure>`](#), this attribute indicates the nature of the right bar line but not the left. Value conforms to [data.BOOLEAN](#).

`<barLine> → att.barLine.log → att.meterConformance.bar → @control`

**@copyof** (*optional*) Points to an element of which the current element is a copy. Value conforms to [data.URI](#).

`<barLine> → att.common → att.linking → @copyof`

**@corresp** (*optional*) Used to point to other elements that correspond to this one in a generic fashion. One or more values from [data.URI](#), separated by spaces.

`<barLine> → att.common → att.linking → @corresp`

**@evaluate** (*optional*) Specifies the intended meaning when a participant in a relationship is itself a pointer. Allowed values are: "**all**" (*If an element pointed to is itself a pointer, then the target of that pointer will be taken, and so on, until an element is found which is not a pointer.*), "**one**" (*If an element pointed to is itself a pointer, then its target (whether a pointer or not) is taken as the target of this pointer.*), "**none**" (*No further evaluation of targets is carried out beyond that needed to find the element(s) specified in plist or target attribute.*)

`<barLine> → att.targetEval → @evaluate`

**@facs** (*optional*) Points to one or more images, portions of an image, or surfaces which correspond to the current element. One or more values from [data.URI](#), separated by spaces.

`<barLine> → att.facsimile → @facs`

**@follows** (*optional*) points to one or more events in a user-defined collection that are known to be predecessors of the current element. One or more values from [data.URI](#), separated by spaces.

`<barLine> → att.common → att.linking → @follows`

**@form** (*optional*) Records the appearance and usually the function of the bar line. Value conforms to [data.BARRENDITION](#).

<barLine> → [att.barLine.log](#) → @form

**@glyph.auth** (*optional*) A name or label associated with the controlled vocabulary from which the value of `glyph.name` or `glyph.num` is taken, or the textual content of the element. Allowed values are: "smufl" (*Standard Music Font Layout*.)

<barLine> → [att.barLine.vis](#) → [att.extSym](#) → [att.extSym.auth](#) → @glyph.auth

**@glyph.name** (*optional*) Glyph name. Value is plain text.

<barLine> → [att.barLine.vis](#) → [att.extSym](#) → [att.extSym.names](#) → @glyph.name

**@glyph.num** (*optional*) Numeric glyph reference in hexadecimal notation, e.g., "#xE000" or "U+E000".

N.B. SMuFL version 1.18 uses the range U+E000 - U+ECBF. Value conforms to [data.HEXNUM](#).

<barLine> → [att.barLine.vis](#) → [att.extSym](#) → [att.extSym.names](#) → @glyph.num

**@glyph.uri** (*optional*) The web-accessible location of the controlled vocabulary from which the value of `glyph.name` or `glyph.num` is taken, or the textual content of the element. Value conforms to [data.URI](#).

<barLine> → [att.barLine.vis](#) → [att.extSym](#) → [att.extSym.auth](#) → @glyph.uri

**@label** (*optional*) Captures text to be used to generate a label for the element to which it's attached, a "tool tip" or prefatory text, for example. Should not be used to record document content. Value is plain text.

<barLine> → [att.common](#) → [att.labelled](#) → @label

**@len** (*optional*) States the length of bar lines in virtual units. The value must be greater than 0 and is typically equal to 2 times (the number of staff lines - 1); e.g., a value of 8 for a 5-line staff. Value is a decimal number.

<barLine> → [att.barLine.vis](#) → @len

**@metcon** (*optional*) Indicates the relationship between the content of a measure and the prevailing meter. Value conforms to [data.BOOLEAN](#).

<barLine> → [att.barLine.log](#) → [att.meterConformance.bar](#) → @metcon

**@method** (*optional*) Records the method of barring. Value conforms to [data.BARMETHOD](#).

<barLine> → [att.barLine.vis](#) → @method

**@n** (*optional*) Provides a number-like designation that indicates an element's position in a sequence of similar elements. May not contain space characters. Value conforms to [data.WORD](#).

<barLine> → [att.common](#) → [att.nNumberLike](#) → @n

**@next** (*optional*) Used to point to the next event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<barLine> → [att.common](#) → [att.linking](#) → @next

**@place** (*optional*) Denotes the staff location of the bar line if its length is non-standard. Value conforms to [data.STAFFLOC](#).

<barLine> → [att.barLine.vis](#) → @place

**@precedes** (*optional*) Points to one or more events in a user-defined collection that are known to be successors of the current element. One or more values from [data.URI](#), separated by spaces.

<barLine> → [att.common](#) → [att.linking](#) → @precedes

**@prev** (*optional*) Points to the previous event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<barLine> → att.common → att.linked → @prev

**@resp** (*optional*) Indicates the agent(s) responsible for some aspect of the text's transcription, editing, or encoding. Its value must point to one or more identifiers declared in the document header. One or more values from [data.URI](#), separated by spaces.

<barLine> → att.common → att.responsibility → @resp

**@sameas** (*optional*) Points to an element that is the same as the current element but is not a literal copy of the current element. One or more values from [data.URI](#), separated by spaces.

<barLine> → att.common → att.linked → @sameas

**@synch** (*optional*) Points to elements that are synchronous with the current element. One or more values from [data.URI](#), separated by spaces.

<barLine> → att.common → att.linked → @synch

**@target** (*optional*) Identifies passive participants in a relationship; that is, the entities pointed "to". One or more values from [data.URI](#), separated by spaces.

<barLine> → att.pointing → @target

**@targettype** (*optional*) Characterization of target resource(s) using any convenient classification scheme or typology. Value is a [NMOKEN](#).

<barLine> → att.pointing → @targettype

**@type** (*optional*) Designation which characterizes the element in some sense, using any convenient classification scheme or typology that employs single-token labels. One or more values of datatype [NMOKEN](#), separated by spaces.

<barLine> → att.common → att.typed → @type

**@visible** (*optional*) Indicates if a feature should be rendered when the notation is presented graphically or sounded when it is presented in an aural form. Value conforms to [data.BOOLEAN](#).

<barLine> → att.barLine.vis → att.visibility → @visible

**@width** (*optional*) Measurement of the horizontal dimension of an entity. Value conforms to [data.MEASUREMENTUNSIGNED](#).

<barLine> → att.barLine.vis → att.width → @width

**@xlink:actuate** (*optional*) Defines whether a link occurs automatically or must be requested by the user. Allowed values are: "**onLoad**" (*Load the target resource(s) immediately.*), "**onRequest**" (*Load the target resource(s) upon user request.*), "**none**" (*Do not permit loading of the target resource(s).*), "**other**" (*Behavior other than allowed by the other values of this attribute.*)

<barLine> → att.pointing → @xlink:actuate

**@xlink:role** (*optional*) Characterization of the relationship between resources. The value of the role attribute must be a URI. Value conforms to [data.URI](#).

<barLine> → att.pointing → @xlink:role

**@xlink:show** (*optional*) Defines how a remote resource is rendered. Allowed values are: "**new**" (*Open in a new window.*), "**replace**" (*Load the referenced resource in the same window.*), "**embed**" (*Embed the referenced resource at the point of the link.*), "**none**" (*Do not permit traversal to the referenced resource.*), "**other**" (*Behavior other than permitted by the other values of this attribute.*)

<barLine> → att.pointing → @xlink:show

**@xml:base** (*optional*) Provides a base URI reference with which applications can resolve relative URI references into absolute URI references. Value conforms to [data.URI](#).

<barLine> → att.common → att.basic → @xml:base

**@xml:id** (*optional*) Regularizes the naming of an element and thus facilitates building links between it and other resources. Each id attribute within a document must have a unique value. Value is a valid xml:id.

<barLine> → att.common → att.basic → att.id → @xml:id

## Member of

model.eventLike Groups event elements that occur in all notational repertoires.

## Contained By

**<abbr>** A generic element for 1) a shortened form of a word, including an acronym or 2) a shorthand notation.

<barLine> → model.eventLike → model.layerPart → <abbr>

**<add>** Marks an addition to the text.

<barLine> → model.eventLike → model.layerPart → <add>

**<beam>** A container for a series of explicitly beamed events that begins and ends entirely within a measure.

<barLine> → model.eventLike → <beam>

**<corr>** Contains the correct form of an apparent erroneous passage.

<barLine> → model.eventLike → model.layerPart → <corr>

**<damage>** Contains an area of damage to the physical medium.

<barLine> → model.eventLike → model.layerPart → <damage>

**<del>** Contains information deleted, marked as deleted, or otherwise indicated as superfluous or spurious in the copy text by an author, scribe, annotator, or corrector.

<barLine> → model.eventLike → model.layerPart → <del>

**<expan>** Contains the expansion of an abbreviation.

<barLine> → model.eventLike → model.layerPart → <expan>

**<graceGrp>** A container for a sequence of grace notes.

<barLine> → model.eventLike → <graceGrp>

**<layer>** An independent stream of events on a staff.

<barLine> → model.eventLike → model.layerPart → <layer>

**<lem>** (lemma) – Contains the lemma, or base text, of a textual variation.

<barLine> → model.eventLike → model.layerPart → <lem>

**<ligature>** A mensural notation symbol that combines two or more notes into a single sign.

<barLine> → model.eventLike → <ligature>

**<oLayer>** A layer that contains an alternative to material in another layer.

<barLine> → model.eventLike → model.layerPart → <oLayer>

**<orig>** Contains material which is marked as following the original, rather than being normalized or corrected.

<barLine> → model.eventLike → model.layerPart → <orig>

**<rdg>** (reading) – Contains a single reading within a textual variation.

<barLine> → model.eventLike → model.layerPart → <rdg>

**<reg>** Contains material which has been regularized or normalized in some sense.

<barLine> → model.eventLike → model.layerPart → <reg>

**<restore>** Indicates restoration of material to an earlier state by cancellation of an editorial or authorial marking or instruction.

<barLine> → model.eventLike → model.layerPart → <restore>

**<sic>** Contains apparently incorrect or inaccurate material.

<barLine> → model.eventLike → model.layerPart → <sic>

**<supplied>** Contains material supplied by the transcriber or editor for any reason.

<barLine> → model.eventLike → model.layerPart → <supplied>

**<tuplet>** A group of notes with "irregular" (sometimes called "irrational") rhythmic values, for example, three notes in the time normally occupied by two or nine in the time of five.

<barLine> → model.eventLike → <tuplet>

**<unclear>** Contains material that cannot be transcribed with certainty because it is illegible or inaudible in the source.

<barLine> → model.eventLike → model.layerPart → <unclear>

## May Contain

- (<barLine> may not have child elements)

## Remarks

This element is provided for repertoires, such as mensural notation, that lack measures. Because the **<barLine>** element's attributes, from which the logical and visual characteristics of the bar line can be discerned, largely duplicate those of measure, the use of **<barLine>** is not necessary within **<measure>** elements in CMN.

## Declaration

## <barre>

A barre in a chord tablature grid.

### Referenced in chapters

[10.2.1.1 Interpreted Chord Data in scoreDef](#), [10.2.1.2 Chord Tablature Grids](#)

### Module

[MEI.stringtab](#)

### Attributes

**@class** (*optional*) Contains one or more URIs which denote classification terms that apply to the entity bearing this attribute. One or more values from [data.URI](#), separated by spaces.

<barre> → [att.common](#) → [att.typed](#) → [att.classed](#) → @class

**@copyof** (*optional*) Points to an element of which the current element is a copy. Value conforms to [data.URI](#).

<barre> → [att.common](#) → [att.linkin](#) → @copyof

**@corresp** (*optional*) Used to point to other elements that correspond to this one in a generic fashion. One or more values from [data.URI](#), separated by spaces.

<barre> → [att.common](#) → [att.linkin](#) → @corresp

**@endid** (*optional*) Indicates the final element in a sequence of events to which the feature applies. Value conforms to [data.URI](#).

<barre> → [att.startEndId](#) → @endid

**@follows** (*optional*) points to one or more events in a user-defined collection that are known to be predecessors of the current element. One or more values from [data.URI](#), separated by spaces.

<barre> → [att.common](#) → [att.linkin](#) → @follows

**@fret** (*optional*) Records the location at which the strings should be stopped against a fret in a fretboard diagram. This may or may not be the same as the actual location on the fretboard of the instrument in performance. Value is a positive integer.

<barre> → direct children → @fret

**@label** (*optional*) Captures text to be used to generate a label for the element to which it's attached, a "tool tip" or prefatory text, for example. Should not be used to record document content. Value is plain text.

<barre> → [att.common](#) → [att.labelled](#) → @label

**@n** (*optional*) Provides a number-like designation that indicates an element's position in a sequence of similar elements. May not contain space characters. Value conforms to [data.WORD](#).

<barre> → [att.common](#) → [att.nNumberLike](#) → @n

**@next** (*optional*) Used to point to the next event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<barre> → [att.common](#) → [att.linkin](#) → @next

**@precedes** (*optional*) Points to one or more events in a user-defined collection that are known to be successors of the current element. One or more values from [data.URI](#), separated by spaces.

<barre> → [att.common](#) → [att.linkin](#) → @precedes

**@prev** (*optional*) Points to the previous event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<barre> → [att.common](#) → [att.linking](#) → @prev

**@resp** (*optional*) Indicates the agent(s) responsible for some aspect of the text's transcription, editing, or encoding. Its value must point to one or more identifiers declared in the document header. One or more values from [data.URI](#), separated by spaces.

<barre> → [att.common](#) → [att.responsibility](#) → @resp

**@sameas** (*optional*) Points to an element that is the same as the current element but is not a literal copy of the current element. One or more values from [data.URI](#), separated by spaces.

<barre> → [att.common](#) → [att.linking](#) → @sameas

**@startid** (*optional*) Holds a reference to the first element in a sequence of events to which the feature applies. Value conforms to [data.URI](#).

<barre> → [att.startEndId](#) → [att.startId](#) → @startid

**@synch** (*optional*) Points to elements that are synchronous with the current element. One or more values from [data.URI](#), separated by spaces.

<barre> → [att.common](#) → [att.linking](#) → @synch

**@type** (*optional*) Designation which characterizes the element in some sense, using any convenient classification scheme or typology that employs single-token labels. One or more values of datatype **NMTOKEN**, separated by spaces.

<barre> → [att.common](#) → [att.typed](#) → @type

**@xml:base** (*optional*) Provides a base URI reference with which applications can resolve relative URI references into absolute URI references. Value conforms to [data.URI](#).

<barre> → [att.common](#) → [att.basic](#) → @xml:base

**@xml:id** (*optional*) Regularizes the naming of an element and thus facilitates building links between it and other resources. Each id attribute within a document must have a unique value. Value is a valid [xml:id](#).

<barre> → [att.common](#) → [att.basic](#) → [att.id](#) → @xml:id

## Member of

(barre isn't member of any model class)

## Contained By

**<chordDef>** Chord tablature definition.

<barre> → elements having barre as direct children → <chordDef>

## May Contain

– (<barre> may not have child elements)

## Remarks

The startid and endid attributes are used to indicate the **<chordMember>** elements on which the barre starts and finishes respectively. The fret at which the barre should be created is recorded by the fret attribute.

## Declaration

```
<elementSpec ident="barre" module="MEI.stringtab">
  <desc xml:lang="en">A barre in a chord tablature grid.</desc>

    <att>fret</att> attribute.</p>
  </remarks>
</elementSpec>
```

## <beam>

A container for a series of explicitly beamed events that begins and ends entirely within a measure.

### Referenced in chapters

[4.3.1 Beams](#), [4.3.4 Tuples](#)

### Module

[MEI.cmn](#)

### Attributes

**@beam.with** (*optional*) In the case of cross-staff beams, the beam.with attribute is used to indicate which staff the beam is connected to; that is, the staff above or the staff below. Value conforms to [data.NEIGHBORINGLAYER](#).

<beam> → [att.beam.log](#) → [att.beamedWith](#) → @beam.with

**@class** (*optional*) Contains one or more URIs which denote classification terms that apply to the entity bearing this attribute. One or more values from [data.URI](#), separated by spaces.

<beam> → [att.common](#) → [att.typed](#) → [att.classed](#) → @class

**@color** (*optional*) Used to indicate visual appearance. Do not confuse this with the musical term 'color' as used in pre-CMN notation. Value conforms to [data.COLOR](#).

<beam> → [att.beam.vis](#) → [att.color](#) → @color

**@copyof** (*optional*) Points to an element of which the current element is a copy. Value conforms to [data.URI](#).

<beam> → [att.common](#) → [att.linkin](#) → @copyof

**@corresp** (*optional*) Used to point to other elements that correspond to this one in a generic fashion. One or more values from [data.URI](#), separated by spaces.

<beam> → [att.common](#) → [att.linkin](#) → @corresp

**@cue** (*optional*) Value conforms to [data.BOOLEAN](#).

<beam> → [att.beam.vis](#) → [att.cue](#) → @cue

**@facsimile** (*optional*) Points to one or more images, portions of an image, or surfaces which correspond to the current element. One or more values from [data.URI](#), separated by spaces.

<beam> → [att.facsimile](#) → @facsimile

**@follows** (*optional*) points to one or more events in a user-defined collection that are known to be predecessors of the current element. One or more values from [data.URI](#), separated by spaces.

<beam> → [att.common](#) → [att.linkin](#) → @follows

**@form** (*optional*) Captures whether a beam is "feathered" and in which direction. Allowed values are: "acc" (*means that the secondary beams become progressively more distant toward the end of the beam.*), "mixed" (*for beams that are "feathered" in both directions.*), "rit" (*indicates that the secondary beams get progressively closer together toward the end of the beam.*), "norm" (*indicates that the secondary beams are equidistant along the course of the beam.*)

<beam> → [att.beam.vis](#) → [att.beamRend](#) → @form

**@label** (*optional*) Captures text to be used to generate a label for the element to which it's attached, a "tool tip" or prefatory text, for example. Should not be used to record document content. Value is plain text.

<beam> → att.common → att.labelled → @label

**@layer** (*optional*) Identifies the layer to which a feature applies. One or more values of datatype **positiveInteger**, separated by spaces.

<beam> → att.beam.log → att.event → att.layerIdent → @layer

**@n** (*optional*) Provides a number-like designation that indicates an element's position in a sequence of similar elements. May not contain space characters. Value conforms to **data.WORD**.

<beam> → att.common → att.nNumberLike → @n

**@next** (*optional*) Used to point to the next event(s) in a user-defined collection. One or more values from **data.URI**, separated by spaces.

<beam> → att.common → att.linked → @next

**@place** (*optional*) Records the placement of the beam relative to the events it affects. Value conforms to **data.BEAMPLACE**.

<beam> → att.beam.vis → att.beamRend → @place

**@precedes** (*optional*) Points to one or more events in a user-defined collection that are known to be successors of the current element. One or more values from **data.URI**, separated by spaces.

<beam> → att.common → att.linked → @precedes

**@prev** (*optional*) Points to the previous event(s) in a user-defined collection. One or more values from **data.URI**, separated by spaces.

<beam> → att.common → att.linked → @prev

**@resp** (*optional*) Indicates the agent(s) responsible for some aspect of the text's transcription, editing, or encoding. Its value must point to one or more identifiers declared in the document header. One or more values from **data.URI**, separated by spaces.

<beam> → att.common → att.responsibility → @resp

**@sameas** (*optional*) Points to an element that is the same as the current element but is not a literal copy of the current element. One or more values from **data.URI**, separated by spaces.

<beam> → att.common → att.linked → @sameas

**@slash** (*optional*) Indicates presence of slash through the beam. Value conforms to **data.BOOLEAN**.

<beam> → att.beam.vis → att.beamRend → @slash

**@slope** (*optional*) Records the slope of the beam. Value is a decimal number.

<beam> → att.beam.vis → att.beamRend → @slope

**@staff** (*recommended*) Signifies the staff on which a notated event occurs or to which a control event applies. Mandatory when applicable. One or more values of datatype **positiveInteger**, separated by spaces.

<beam> → att.beam.log → att.event → att.staffIdent → @staff

**@synch** (*optional*) Points to elements that are synchronous with the current element. One or more values from **data.URI**, separated by spaces.

<beam> → att.common → att.linked → @synch

**@tstamp** (*optional*) Encodes the onset time in terms of musical time, i.e., beats[.fractional beat part], as expressed in the written time signature. Value conforms to **data.BEAT**.

<beam> → att.beam.log → att.event → att.timestamp.log → @tstamp

**@tstamp.ges** (*optional*) Encodes the onset time in terms of musical time, i.e., beats[.fractional beat part], as expressed in the written time signature. Value conforms to [data.BEAT](#).

<beam> → att.beam.log → att.event → att.timestamp.ges → @tstamp.ges

**@tstamp.real** (*optional*) Records the onset time in terms of ISO time. Value conforms to [data.ISOTIME](#).

<beam> → att.beam.log → att.event → att.timestamp.ges → @tstamp.real

**@type** (*optional*) Designation which characterizes the element in some sense, using any convenient classification scheme or typology that employs single-token labels. One or more values of datatype **NMTOKEN**, separated by spaces.

<beam> → att.common → att.typed → @type

**@visible** (*optional*) Indicates if a feature should be rendered when the notation is presented graphically or sounded when it is presented in an aural form. Value conforms to [data.BOOLEAN](#).

<beam> → att.beam.vis → att.visibility → @visible

**@when** (*optional*) Indicates the point of occurrence of this feature along a time line. Its value must be the ID of a <when> element elsewhere in the document. Value conforms to [data.URI](#).

<beam> → att.beam.log → att.event → att.alignment → @when

**@xml:base** (*optional*) Provides a base URI reference with which applications can resolve relative URI references into absolute URI references. Value conforms to [data.URI](#).

<beam> → att.common → att.basic → @xml:base

**@xml:id** (*optional*) Regularizes the naming of an element and thus facilitates building links between it and other resources. Each id attribute within a document must have a unique value. Value is a valid [xml:id](#).

<beam> → att.common → att.basic → att.id → @xml:id

## Member of

[model.eventLike.cmn](#) Groups events that appear in CMN.

## Contained By

**<abbr>** A generic element for 1) a shortened form of a word, including an acronym or 2) a shorthand notation.

<beam> → [model.eventLike.cmn](#) → [model.layerPart.cmn](#) → [model.layerPart](#) → <abbr>

**<add>** Marks an addition to the text.

<beam> → [model.eventLike.cmn](#) → [model.layerPart.cmn](#) → [model.layerPart](#) → <add>

**<beam>** A container for a series of explicitly beamed events that begins and ends entirely within a measure.

<beam> → [model.eventLike.cmn](#) → <beam>

**<corr>** Contains the correct form of an apparent erroneous passage.

<beam> → [model.eventLike.cmn](#) → [model.layerPart.cmn](#) → [model.layerPart](#) → <corr>

**<damage>** Contains an area of damage to the physical medium.

<beam> → [model.eventLike.cmn](#) → [model.layerPart.cmn](#) → [model.layerPart](#) → <damage>

**<del>** Contains information deleted, marked as deleted, or otherwise indicated as superfluous or spurious in the copy text by an author, scribe, annotator, or corrector.

<beam> → [model.eventLike.cmn](#) → [model.layerPart.cmn](#) → [model.layerPart](#) → <del>

**<expan>** Contains the expansion of an abbreviation.

<beam> → model.eventLike.cmn → model.layerPart.cmn → model.layerPart → <expan>

**<graceGrp>** A container for a sequence of grace notes.

<beam> → model.eventLike.cmn → <graceGrp>

**<layer>** An independent stream of events on a staff.

<beam> → model.eventLike.cmn → model.layerPart.cmn → model.layerPart → <layer>

**<lem>** (lemma) – Contains the lemma, or base text, of a textual variation.

<beam> → model.eventLike.cmn → model.layerPart.cmn → model.layerPart → <lem>

**<oLayer>** A layer that contains an alternative to material in another layer.

<beam> → model.eventLike.cmn → model.layerPart.cmn → model.layerPart → <oLayer>

**<orig>** Contains material which is marked as following the original, rather than being normalized or corrected.

<beam> → model.eventLike.cmn → model.layerPart.cmn → model.layerPart → <orig>

**<rdg>** (reading) – Contains a single reading within a textual variation.

<beam> → model.eventLike.cmn → model.layerPart.cmn → model.layerPart → <rdg>

**<reg>** Contains material which has been regularized or normalized in some sense.

<beam> → model.eventLike.cmn → model.layerPart.cmn → model.layerPart → <reg>

**<restore>** Indicates restoration of material to an earlier state by cancellation of an editorial or authorial marking or instruction.

<beam> → model.eventLike.cmn → model.layerPart.cmn → model.layerPart → <restore>

**<sic>** Contains apparently incorrect or inaccurate material.

<beam> → model.eventLike.cmn → model.layerPart.cmn → model.layerPart → <sic>

**<supplied>** Contains material supplied by the transcriber or editor for any reason.

<beam> → model.eventLike.cmn → model.layerPart.cmn → model.layerPart → <supplied>

**<tuplet>** A group of notes with "irregular" (sometimes called "irrational") rhythmic values, for example, three notes in the time normally occupied by two or nine in the time of five.

<beam> → model.eventLike.cmn → <tuplet>

**<unclear>** Contains material that cannot be transcribed with certainty because it is illegible or inaudible in the source.

<beam> → model.eventLike.cmn → model.layerPart.cmn → model.layerPart → <unclear>

## May Contain

**<add>** Marks an addition to the text.

<beam> → model.transcriptionLike → <add>

**<app>** (apparatus) – Contains one or more alternative encodings.

<beam> → model.appLike → <app>

**<bTrem>** A rapid alternation on a single pitch or chord.

<beam> → model.eventLike.cmn → <bTrem>

**<barLine>** Vertical line drawn through one or more staves that divides musical notation into metrical units.

<beam> → model.eventLike → <barLine>

**<beam>** A container for a series of explicitly beamed events that begins and ends entirely within a measure.

<beam> → model.eventLike.cmn → <beam>

**<beatRpt>** An indication that material on a preceding beat should be repeated.

<beam> → model.eventLike.cmn → <beatRpt>

**<choice>** Groups a number of alternative encodings for the same point in a text.

<beam> → model.editLike → <choice>

**<chord>** A simultaneous sounding of two or more notes in the same layer \*with the same duration\*.

<beam> → model.eventLike → <chord>

**<clef>** Indication of the exact location of a particular note on the staff and, therefore, the other notes as well.

<beam> → model.eventLike → <clef>

**<clefGrp>** A set of simultaneously-occurring clefs.

<beam> → model.eventLike → <clefGrp>

**<corr>** Contains the correct form of an apparent erroneous passage.

<beam> → model.transcriptionLike → <corr>

**<custos>** Symbol placed at the end of a line of music to indicate the first note of the next line. Sometimes called a "direct".

<beam> → model.eventLike → <custos>

**<damage>** Contains an area of damage to the physical medium.

<beam> → model.transcriptionLike → <damage>

**<del>** Contains information deleted, marked as deleted, or otherwise indicated as superfluous or spurious in the copy text by an author, scribe, annotator, or corrector.

<beam> → model.transcriptionLike → <del>

**<fTrem>** A rapid alternation between a pair of notes (or chords or perhaps between a note and a chord) that are (usually) farther apart than a major second.

<beam> → model.eventLike.cmn → <fTrem>

**<gap>** Indicates a point where material has been omitted in a transcription, whether as part of sampling practice or for editorial reasons described in the MEI header.

<beam> → model.transcriptionLike → <gap>

**<graceGrp>** A container for a sequence of grace notes.

<beam> → model.eventLike.cmn → <graceGrp>

**<halfmRpt>** A half-measure repeat in any meter.

<beam> → model.eventLike.cmn → <halfmRpt>

**<handShift>** Marks the beginning of a passage written in a new hand, or of a change in the scribe, writing style, ink or character of the document hand.

<beam> → model.transcriptionLike → <handShift>

**<keySig>** Written key signature.

<beam> → model.eventLike → model.keySigLike → <keySig>

**<meterSig>** Written meter signature.

<beam> → model.eventLike → model.meterSigLike → <meterSig>

**<meterSigGrp>** Used to capture alternating, interchanging, mixed or other non-standard meter signatures.

<beam> → model.eventLike → model.meterSigLike → <meterSigGrp>

**<note>** A single pitched event.

<beam> → model.eventLike → <note>

**<orig>** Contains material which is marked as following the original, rather than being normalized or corrected.

<beam> → model.transcriptionLike → <orig>

**<pad>** An indication of extra visual space between notational elements.

<beam> → model.eventLike → <pad>

**<reg>** Contains material which has been regularized or normalized in some sense.

<beam> → model.transcriptionLike → <reg>

**<rest>** A non-sounding event found in the source being transcribed.

<beam> → model.eventLike → <rest>

**<restore>** Indicates restoration of material to an earlier state by cancellation of an editorial or authorial marking or instruction.

<beam> → model.transcriptionLike → <restore>

**<sic>** Contains apparently incorrect or inaccurate material.

<beam> → model.transcriptionLike → <sic>

**<space>** A placeholder used to fill an incomplete measure, layer, etc. most often so that the combined duration of the events equals the number of beats in the measure.

<beam> → model.eventLike → <space>

**<subst>** Groups transcriptional elements when the combination is to be regarded as a single intervention in the text.

<beam> → model.editLike → <subst>

**<supplied>** Contains material supplied by the transcriber or editor for any reason.

<beam> → model.transcriptionLike → <supplied>

**<tuplet>** A group of notes with "irregular" (sometimes called "irrational") rhythmic values, for example, three notes in the time normally occupied by two or nine in the time of five.

<beam> → model.eventLike.cmn → <tuplet>

**<unclear>** Contains material that cannot be transcribed with certainty because it is illegible or inaudible in the source.

<beam> → model.transcriptionLike → <unclear>

## Remarks

For beams that cross the bar line, use the **<beamSpan>** element. Secondary beams may be broken explicitly using the breaksec attribute on the notes or chords under the beam. Automated beaming, as opposed to explicitly marked beams, may be indicated for an entire score, part or section by using the beam.group and beam.rests attributes on these elements.

## Constraints

A beam that contains neither a copyof nor sameas attribute must have at least 2 note, rest, chord, or space descendants.

## Declaration

DEVELOPMENT  
VERSION

## <beamSpan>

(beam span) – Alternative element for explicitly encoding beams, particularly those which extend across bar lines.

### Referenced in chapters

[4.3.1 Beams](#)

### Module

[MEI.cmn](#)

### Attributes

**@beam.with** (*optional*) In the case of cross-staff beams, the beam.with attribute is used to indicate which staff the beam is connected to; that is, the staff above or the staff below. Value conforms to [data.NEIGHBORINGLAYER](#).

<beamSpan> → att.beamSpan.log → att.beamedWith → @beam.with

**@class** (*optional*) Contains one or more URIs which denote classification terms that apply to the entity bearing this attribute. One or more values from [data.URI](#), separated by spaces.

<beamSpan> → att.common → att.typed → att.classed → @class

**@color** (*optional*) Used to indicate visual appearance. Do not confuse this with the musical term 'color' as used in pre-CMN notation. Value conforms to [data.COLOR](#).

<beamSpan> → att.beamSpan.vis → att.beam.vis → att.color → @color

**@copyof** (*optional*) Points to an element of which the current element is a copy. Value conforms to [data.URI](#).

<beamSpan> → att.common → att.linking → @copyof

**@corresp** (*optional*) Used to point to other elements that correspond to this one in a generic fashion. One or more values from [data.URI](#), separated by spaces.

<beamSpan> → att.common → att.linking → @corresp

**@cue** (*optional*) Value conforms to [data.BOOLEAN](#).

<beamSpan> → att.beamSpan.vis → att.beam.vis → att.cue → @cue

**@dots.ges** (*optional*) Number of dots required for a gestural duration when different from that of the written duration. Value conforms to [data.AUGMENTDOT](#).

<beamSpan> → att.beamSpan.ges → att.duration.ges → @dots.ges

**@dur** (*optional*) When a duration cannot be represented as a single power-of-two value, multiple space-separated values that add up to the total duration may be used. One or more values from [data.DURATION](#), separated by spaces.

<beamSpan> → att.beamSpan.log → att.duration.additive → @dur

**@dur.ges** (*optional*) Records performed duration information that differs from the written duration. Value conforms to [data.DURATION.GESTURAL](#).

<beamSpan> → att.beamSpan.ges → att.duration.ges → @dur.ges

**@dur.metrical** (*optional*) Duration as a count of units provided in the time signature denominator. Value is a decimal number.

<beamSpan> → att.beamSpan.ges → att.duration.ges → @dur.metrical

**@dur.ppq** (*optional*) Duration recorded as pulses-per-quarter note, e.g., MIDI clicks or MusicXML divisions. Value is a positive integer, including 0.

<beamSpan> → att.beamSpan.ges → att.duration.ges → @dur.ppq

**@dur.real** (*optional*) Duration in seconds, e.g., 1.732. Value is a decimal number.

<beamSpan> → att.beamSpan.ges → att.duration.ges → @dur.real

**@dur.recip** (*optional*) Duration as an optionally dotted Humdrum **\*\*recip value**. Value is a [token](#).

<beamSpan> → att.beamSpan.ges → att.duration.ges → @dur.recip

**@endid** (*optional*) Indicates the final element in a sequence of events to which the feature applies. Value conforms to [data.URI](#).

<beamSpan> → att.beamSpan.log → att.startEndId → @endid

**@evaluate** (*optional*) Specifies the intended meaning when a participant in a relationship is itself a pointer. Allowed values are: "**all**" (*If an element pointed to is itself a pointer, then the target of that pointer will be taken, and so on, until an element is found which is not a pointer.*), "**one**" (*If an element pointed to is itself a pointer, then its target (whether a pointer or not) is taken as the target of this pointer.*), "**none**" (*No further evaluation of targets is carried out beyond that needed to find the element(s) specified in plist or target attribute.*)

<beamSpan> → att.beamSpan.log → att.controlEvent → att.targetEval → @evaluate

**@facsimile** (*optional*) Points to one or more images, portions of an image, or surfaces which correspond to the current element. One or more values from [data.URI](#), separated by spaces.

<beamSpan> → att.facsimile → @facsimile

**@follows** (*optional*) points to one or more events in a user-defined collection that are known to be predecessors of the current element. One or more values from [data.URI](#), separated by spaces.

<beamSpan> → att.common → att.linked → @follows

**@form** (*optional*) Captures whether a beam is "feathered" and in which direction. Allowed values are: "**acc**" (*means that the secondary beams become progressively more distant toward the end of the beam.*), "**mixed**" (*for beams that are "feathered" in both directions.*), "**rit**" (*indicates that the secondary beams get progressively closer together toward the end of the beam.*), "**norm**" (*indicates that the secondary beams are equidistant along the course of the beam.*)

<beamSpan> → att.beamSpan.vis → att.beam.vis → att.beamRend → @form

**@label** (*optional*) Captures text to be used to generate a label for the element to which it's attached, a "tool tip" or prefatory text, for example. Should not be used to record document content. Value is plain text.

<beamSpan> → att.common → att.labelled → @label

**@layer** (*optional*) Identifies the layer to which a feature applies. One or more values of datatype **positiveInteger**, separated by spaces.

<beamSpan> → att.beamSpan.log → att.controlEvent → att.layerIdent → @layer

**@n** (*optional*) Provides a number-like designation that indicates an element's position in a sequence of similar elements. May not contain space characters. Value conforms to [data.WORD](#).

<beamSpan> → att.common → att.nNumberLike → @n

**@next** (*optional*) Used to point to the next event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<beamSpan> → att.common → att.linked → @next

**@part** (*optional*) Indicates the part in which the current feature should appear. Use '%all' when the feature should occur in every part. One or more values of datatype **a string matching the following regular expression: "(%all|#[\i][\c]+)"**, separated by spaces.

<beamSpan> → att.beamSpan.log → att.controlEvent → att.partIdent → @part

**@partstaff** (*optional*) Signifies the staff on which a notated feature occurs. Use '%all' when the feature should occur on every staff. One or more values of datatype **a string matching the following regular expression: "(%all|\d+(-\d+)?)"**, separated by spaces.

<beamSpan> → att.beamSpan.log → att.controlEvent → att.partIdent → @partstaff

**@place** (*optional*) Records the placement of the beam relative to the events it affects. Value conforms to [data.BEAMPLACE](#).

<beamSpan> → att.beamSpan.vis → att.beam.vis → att.beamRend → @place

**@plist** (*optional*) When the target attribute is present, plist identifies the active participants; that is, those entities pointed "from", in a relationship with the specified target(s). When the target attribute is not present, it identifies participants in a mutual relationship. One or more values from [data.URI](#), separated by spaces.

<beamSpan> → att.beamSpan.log → att.controlEvent → att.plist → @plist

**@precedes** (*optional*) Points to one or more events in a user-defined collection that are known to be successors of the current element. One or more values from [data.URI](#), separated by spaces.

<beamSpan> → att.common → att.linked → @precedes

**@prev** (*optional*) Points to the previous event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<beamSpan> → att.common → att.linked → @prev

**@resp** (*optional*) Indicates the agent(s) responsible for some aspect of the text's transcription, editing, or encoding. Its value must point to one or more identifiers declared in the document header. One or more values from [data.URI](#), separated by spaces.

<beamSpan> → att.common → att.responsibility → @resp

**@sameas** (*optional*) Points to an element that is the same as the current element but is not a literal copy of the current element. One or more values from [data.URI](#), separated by spaces.

<beamSpan> → att.common → att.linked → @sameas

**@slash** (*optional*) Indicates presence of slash through the beam. Value conforms to [data.BOOLEAN](#).

<beamSpan> → att.beamSpan.vis → att.beam.vis → att.beamRend → @slash

**@slope** (*optional*) Records the slope of the beam. Value is a decimal number.

<beamSpan> → att.beamSpan.vis → att.beam.vis → att.beamRend → @slope

**@staff** (*recommended*) Signifies the staff on which a notated event occurs or to which a control event applies. Mandatory when applicable. One or more values of datatype **positiveInteger**, separated by spaces.

<beamSpan> → att.beamSpan.log → att.controlEvent → att.staffIdent → @staff

**@startid** (*optional*) Holds a reference to the first element in a sequence of events to which the feature applies. Value conforms to [data.URI](#).

<beamSpan> → att.beamSpan.log → att.startEndId → att.startId → @startid

**@synch** (*optional*) Points to elements that are synchronous with the current element. One or more values from [data.URI](#), separated by spaces.

<beamSpan> → att.common → att.linking → @synch

**@tstamp** (*optional*) Encodes the onset time in terms of musical time, i.e., beats[.fractional beat part], as expressed in the written time signature. Value conforms to [data.BEAT](#).

<beamSpan> → att.beamSpan.log → att.controlEvent → att.timestamp.log → @tstamp

**@tstamp.ges** (*optional*) Encodes the onset time in terms of musical time, i.e., beats[.fractional beat part], as expressed in the written time signature. Value conforms to [data.BEAT](#).

<beamSpan> → att.beamSpan.log → att.controlEvent → att.timestamp.ges → @tstamp.ges

**@tstamp.real** (*optional*) Records the onset time in terms of ISO time. Value conforms to [data.ISOTIME](#).

<beamSpan> → att.beamSpan.log → att.controlEvent → att.timestamp.ges → @tstamp.real

**@tstamp2** (*optional*) Encodes the ending point of an event, i.e., a count of measures plus a beat location in the ending measure. Value conforms to [data.MEASUREBEAT](#).

<beamSpan> → att.beamSpan.log → att.timestamp2.log → @tstamp2

**@tstamp2.ges** (*optional*) Encodes the ending point of an event, i.e., a count of measures plus a beat location in the ending measure. Value conforms to [data.MEASUREBEAT](#).

<beamSpan> → att.beamSpan.ges → att.timestamp2.ges → @tstamp2.ges

**@tstamp2.real** (*optional*) Records the ending point of an event in terms of ISO time. Value conforms to [data.ISOTIME](#).

<beamSpan> → att.beamSpan.ges → att.timestamp2.ges → @tstamp2.real

**@type** (*optional*) Designation which characterizes the element in some sense, using any convenient classification scheme or typology that employs single-token labels. One or more values of datatype **NMTOKEN**, separated by spaces.

<beamSpan> → att.common → att.typed → @type

**@visible** (*optional*) Indicates if a feature should be rendered when the notation is presented graphically or sounded when it is presented in an aural form. Value conforms to [data.BOOLEAN](#).

<beamSpan> → att.beamSpan.vis → att.beam.vis → att.visibility → @visible

**@when** (*optional*) Indicates the point of occurrence of this feature along a time line. Its value must be the ID of a [<when>](#) element elsewhere in the document. Value conforms to [data.URI](#).

<beamSpan> → att.beamSpan.log → att.controlEvent → att.alignment → @when

**@xml:base** (*optional*) Provides a base URI reference with which applications can resolve relative URI references into absolute URI references. Value conforms to [data.URI](#).

<beamSpan> → att.common → att.basic → @xml:base

**@xml:id** (*optional*) Regularizes the naming of an element and thus facilitates building links between it and other resources. Each id attribute within a document must have a unique value. Value is a valid [xml:id](#).

<beamSpan> → att.common → att.basic → att.id → @xml:id

## Member of

[model.controlEventLike.cmn](#) Groups control events that appear in CMN.

## Contained By

**<abbr>** A generic element for 1) a shortened form of a word, including an acronym or 2) a shorthand notation.

<beamSpan> → model.controlEventLike.cmn → model.editTransPart.music → model.editTransPart → <abbr>

**<add>** Marks an addition to the text.

<beamSpan> → model.controlEventLike.cmn → model.editTransPart.music → model.editTransPart → <add>

**<corr>** Contains the correct form of an apparent erroneous passage.

<beamSpan> → model.controlEventLike.cmn → model.editTransPart.music → model.editTransPart → <corr>

**<damage>** Contains an area of damage to the physical medium.

<beamSpan> → model.controlEventLike.cmn → model.editTransPart.music → model.editTransPart → <damage>

**<del>** Contains information deleted, marked as deleted, or otherwise indicated as superfluous or spurious in the copy text by an author, scribe, annotator, or corrector.

<beamSpan> → model.controlEventLike.cmn → model.editTransPart.music → model.editTransPart → <del>

**<expan>** Contains the expansion of an abbreviation.

<beamSpan> → model.controlEventLike.cmn → model.editTransPart.music → model.editTransPart → <expan>

**<lem>** (lemma) – Contains the lemma, or base text, of a textual variation.

<beamSpan> → model.controlEventLike.cmn → model.rdgPart.music → model.rdgPart → <lem>

**<measure>** Unit of musical time consisting of a fixed number of note values of a given type, as determined by the prevailing meter, and delimited in musical notation by bar lines.

<beamSpan> → model.controlEventLike.cmn → model.measurePart → <measure>

**<orig>** Contains material which is marked as following the original, rather than being normalized or corrected.

<beamSpan> → model.controlEventLike.cmn → model.editTransPart.music → model.editTransPart → <orig>

**<rdg>** (reading) – Contains a single reading within a textual variation.

<beamSpan> → model.controlEventLike.cmn → model.rdgPart.music → model.rdgPart → <rdg>

**<reg>** Contains material which has been regularized or normalized in some sense.

<beamSpan> → model.controlEventLike.cmn → model.editTransPart.music → model.editTransPart → <reg>

**<restore>** Indicates restoration of material to an earlier state by cancellation of an editorial or authorial marking or instruction.

<beamSpan> → model.controlEventLike.cmn → model.editTransPart.music → model.editTransPart → <restore>

**<sic>** Contains apparently incorrect or inaccurate material.

<beamSpan> → model.controlEventLike.cmn → model.editTransPart.music → model.editTransPart → <sic>

**<supplied>** Contains material supplied by the transcriber or editor for any reason.

<beamSpan> → model.controlEventLike.cmn → model.editTransPart.music → model.editTransPart → <supplied>

**<unclear>** Contains material that cannot be transcribed with certainty because it is illegible or inaudible in the source.

<beamSpan> → model.controlEventLike.cmn → model.editTransPart.music → model.editTransPart → <unclear>

## May Contain

– (<beamSpan> may not have child elements)

## Remarks

The starting point of the beam may be indicated by either a startid, tstamp, tstamp.ges, or tstamp.real attribute, while the ending point may be recorded by either a dur, dur.ges, endid, or tstamp2 attribute. It is a semantic error not to specify one starting and one ending type of attribute.

## Constraints

Must have one of the attributes: startid, tstamp, tstamp.ges or tstamp.real.

Must have one of the attributes: dur, dur.ges, endid, or tstamp2.

## Declaration

## <beatRpt>

(beat repeat) – An indication that material on a preceding beat should be repeated.

### Referenced in chapters

[4.3.10.2 Measure-Level Repetition Symbols](#), [11.2.1.1 Instructions](#)

### Module

[MEI.cmn](#)

### Attributes

**@altsym** (*optional*) Provides a way of pointing to a user-defined symbol. It must contain a reference to an ID of a [<symbolDef>](#) element elsewhere in the document. Value conforms to [data.URI](#).

<beatRpt> → [att.beatRpt.vis](#) → [att.altSym](#) → @altsym

**@beatdef** (*optional*) Indicates the performed duration represented by the beatRpt symbol; expressed in time signature denominator units. Value is a decimal number.

<beatRpt> → [att.beatRpt.log](#) → @beatdef

**@class** (*optional*) Contains one or more URIs which denote classification terms that apply to the entity bearing this attribute. One or more values from [data.URI](#), separated by spaces.

<beatRpt> → [att.common](#) → [att.typed](#) → [att.classed](#) → @class

**@color** (*optional*) Used to indicate visual appearance. Do not confuse this with the musical term 'color' as used in pre-CMN notation. Value conforms to [data.COLOR](#).

<beatRpt> → [att.beatRpt.vis](#) → [att.color](#) → @color

**@copyof** (*optional*) Points to an element of which the current element is a copy. Value conforms to [data.URI](#).

<beatRpt> → [att.common](#) → [att.linkin](#) → @copyof

**@corresp** (*optional*) Used to point to other elements that correspond to this one in a generic fashion. One or more values from [data.URI](#), separated by spaces.

<beatRpt> → [att.common](#) → [att.linkin](#) → @corresp

**@evaluate** (*optional*) Specifies the intended meaning when a participant in a relationship is itself a pointer. Allowed values are: "**all**" (*If an element pointed to is itself a pointer, then the target of that pointer will be taken, and so on, until an element is found which is not a pointer.*), "**one**" (*If an element pointed to is itself a pointer, then its target (whether a pointer or not) is taken as the target of this pointer.*), "**none**" (*No further evaluation of targets is carried out beyond that needed to find the element(s) specified in plist or target attribute.*)

<beatRpt> → [att.targetEval](#) → @evaluate

**@expand** (*optional*) Indicates whether to render a repeat symbol or the source material to which it refers. A value of 'true' renders the source material, while 'false' displays the repeat symbol. Value conforms to [data.BOOLEAN](#).

<beatRpt> → [att.beatRpt.vis](#) → [att.expandable](#) → @expand

**@facs** (*optional*) Points to one or more images, portions of an image, or surfaces which correspond to the current element. One or more values from [data.URI](#), separated by spaces.

<beatRpt> → [att.facsimile](#) → @facs

**@follows** (*optional*) points to one or more events in a user-defined collection that are known to be predecessors of the current element. One or more values from [data.URI](#), separated by spaces.

<beatRpt> → att.common → att.linking → @follows

**@fontfam** (*optional*) Contains the name of a font-family. Value conforms to [data.FONTFAMILY](#).

<beatRpt> → att.beatRpt.vis → att.typography → @fontfam

**@fontname** (*optional*) Holds the name of a font. Value conforms to [data.FONTNAME](#).

<beatRpt> → att.beatRpt.vis → att.typography → @fontname

**@fontsize** (*optional*) Indicates the size of a font expressed in printers' points, i.e., 1/72nd of an inch, relative terms, e.g., small, larger, etc., or percentage values relative to normal size, e.g., 125%. Value conforms to [data.FONTSIZE](#).

<beatRpt> → att.beatRpt.vis → att.typography → @fontsize

**@fontstyle** (*optional*) Records the style of a font, i.e., italic, oblique, or normal. Value conforms to [data.FONTSTYLE](#).

<beatRpt> → att.beatRpt.vis → att.typography → @fontstyle

**@fontweight** (*optional*) Used to indicate bold type. Value conforms to [data.FONTWEIGHT](#).

<beatRpt> → att.beatRpt.vis → att.typography → @fontweight

**@glyph.auth** (*optional*) A name or label associated with the controlled vocabulary from which the value of `glyph.name` or `glyph.num` is taken, or the textual content of the element. Allowed values are: "**smufl**" (*Standard Music Font Layout*.)

<beatRpt> → att.beatRpt.vis → att.extSym → att.extSym.auth → @glyph.auth

**@glyph.name** (*optional*) Glyph name. Value is plain text.

<beatRpt> → att.beatRpt.vis → att.extSym → att.extSym.names → @glyph.name

**@glyph.num** (*optional*) Numeric glyph reference in hexadecimal notation, e.g., "#xE000" or "U+E000". N.B. SMuFL version 1.18 uses the range U+E000 - U+ECBF. Value conforms to [data.HEXNUM](#).

<beatRpt> → att.beatRpt.vis → att.extSym → att.extSym.names → @glyph.num

**@glyph.uri** (*optional*) The web-accessible location of the controlled vocabulary from which the value of `glyph.name` or `glyph.num` is taken, or the textual content of the element. Value conforms to [data.URI](#).

<beatRpt> → att.beatRpt.vis → att.extSym → att.extSym.auth → @glyph.uri

**@label** (*optional*) Captures text to be used to generate a label for the element to which it's attached, a "tool tip" or prefatory text, for example. Should not be used to record document content. Value is plain text.

<beatRpt> → att.common → att.labelled → @label

**@layer** (*optional*) Identifies the layer to which a feature applies. One or more values of datatype **positiveInteger**, separated by spaces.

<beatRpt> → att.beatRpt.log → att.event → att.layerIdent → @layer

**@letterspacing** (*optional*) Indicates letter spacing (aka tracking) in analogy to the CSS letter-spacing property. Value conforms to [data.MEASUREMENTTYPOGRAPHYSIGNED](#).

<beatRpt> → att.beatRpt.vis → att.typography → @letterspacing

**@lineheight** (*optional*) Indicates line height in analogy to the CSS line-height property. Value conforms to either [data.MEASUREMENTTYPOGRAPHYUNSIGNED](#) or [data.PERCENT](#).

<beatRpt> → att.beatRpt.vis → att.typography → @lineheight

**@on** (*optional*) Provides a number-like designation that indicates an element's position in a sequence of similar elements. May not contain space characters. Value conforms to [data.WORD](#).

<beatRpt> → [att.common](#) → [att.nNumberLike](#) → @on

**@next** (*optional*) Used to point to the next event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<beatRpt> → [att.common](#) → [att.linking](#) → @next

**@plist** (*optional*) When the target attribute is present, plist identifies the active participants; that is, those entities pointed "from", in a relationship with the specified target(s). When the target attribute is not present, it identifies participants in a mutual relationship. One or more values from [data.URI](#), separated by spaces.

<beatRpt> → [att.plist](#) → @plist

**@precedes** (*optional*) Points to one or more events in a user-defined collection that are known to be successors of the current element. One or more values from [data.URI](#), separated by spaces.

<beatRpt> → [att.common](#) → [att.linking](#) → @precedes

**@prev** (*optional*) Points to the previous event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<beatRpt> → [att.common](#) → [att.linking](#) → @prev

**@resp** (*optional*) Indicates the agent(s) responsible for some aspect of the text's transcription, editing, or encoding. Its value must point to one or more identifiers declared in the document header. One or more values from [data.URI](#), separated by spaces.

<beatRpt> → [att.common](#) → [att.responsibility](#) → @resp

**@sameas** (*optional*) Points to an element that is the same as the current element but is not a literal copy of the current element. One or more values from [data.URI](#), separated by spaces.

<beatRpt> → [att.common](#) → [att.linking](#) → @sameas

**@slash** (*required*) Indicates the number of slashes required to render the appropriate beat repeat symbol. When a single beat consisting of a single note or chord is repeated, the repetition symbol is a single thick, slanting slash; therefore, the value 1 should be used. When the beat is divided into even notes, the following values should be used: 4ths or 8ths=1, 16ths=2, 32nds=3, 64ths=4, 128ths=5. When the beat is comprised of mixed duration values, the default rendition is 2 slashes and 2 dots. Value conforms to [data.BEATRPT.REND](#).

<beatRpt> → [att.beatRpt.vis](#) → @slash

**@staff** (*recommended*) Signifies the staff on which a notated event occurs or to which a control event applies. Mandatory when applicable. One or more values of datatype **positiveInteger**, separated by spaces.

<beatRpt> → [att.beatRpt.log](#) → [att.event](#) → [att.staffIdnt](#) → @staff

**@synch** (*optional*) Points to elements that are synchronous with the current element. One or more values from [data.URI](#), separated by spaces.

<beatRpt> → [att.common](#) → [att.linking](#) → @synch

**@tstamp** (*optional*) Encodes the onset time in terms of musical time, i.e., beats[.fractional beat part], as expressed in the written time signature. Value conforms to [data.BEAT](#).

<beatRpt> → [att.beatRpt.log](#) → [att.event](#) → [att.timestamp.log](#) → @tstamp

**@tstamp.ges** (*optional*) Encodes the onset time in terms of musical time, i.e., beats[.fractional beat part], as expressed in the written time signature. Value conforms to [data.BEAT](#).

<beatRpt> → att.beatRpt.log → att.event → att.timestamp.ges → @tstamp.ges

**@tstamp.real** (*optional*) Records the onset time in terms of ISO time. Value conforms to [data.ISOTIME](#).  
<beatRpt> → att.beatRpt.log → att.event → att.timestamp.ges → @tstamp.real

**@type** (*optional*) Designation which characterizes the element in some sense, using any convenient classification scheme or typology that employs single-token labels. One or more values of datatype **NMTOKEN**, separated by spaces.

<beatRpt> → att.common → att.typed → @type

**@when** (*optional*) Indicates the point of occurrence of this feature along a time line. Its value must be the ID of a <when> element elsewhere in the document. Value conforms to [data.URI](#).

<beatRpt> → att.beatRpt.log → att.event → att.alignment → @when

**@xml:base** (*optional*) Provides a base URI reference with which applications can resolve relative URI references into absolute URI references. Value conforms to [data.URI](#).

<beatRpt> → att.common → att.basic → @xml:base

**@xml:id** (*optional*) Regularizes the naming of an element and thus facilitates building links between it and other resources. Each id attribute within a document must have a unique value. Value is a valid [xml:id](#).

<beatRpt> → att.common → att.basic → att.id → @xml:id

## Member of

[model.eventLike.cmn](#) Groups events that appear in CMN.

## Contained By

**<abbr>** A generic element for 1) a shortened form of a word, including an acronym or 2) a shorthand notation.

<beatRpt> → model.eventLike.cmn → model.layerPart.cmn → model.layerPart → <abbr>

**<add>** Marks an addition to the text.

<beatRpt> → model.eventLike.cmn → model.layerPart.cmn → model.layerPart → <add>

**<beam>** A container for a series of explicitly beamed events that begins and ends entirely within a measure.

<beatRpt> → model.eventLike.cmn → <beam>

**<corr>** Contains the correct form of an apparent erroneous passage.

<beatRpt> → model.eventLike.cmn → model.layerPart.cmn → model.layerPart → <corr>

**<damage>** Contains an area of damage to the physical medium.

<beatRpt> → model.eventLike.cmn → model.layerPart.cmn → model.layerPart → <damage>

**<del>** Contains information deleted, marked as deleted, or otherwise indicated as superfluous or spurious in the copy text by an author, scribe, annotator, or corrector.

<beatRpt> → model.eventLike.cmn → model.layerPart.cmn → model.layerPart → <del>

**<expan>** Contains the expansion of an abbreviation.

<beatRpt> → model.eventLike.cmn → model.layerPart.cmn → model.layerPart → <expan>

**<graceGrp>** A container for a sequence of grace notes.

<beatRpt> → model.eventLike.cmn → <graceGrp>

**<layer>** An independent stream of events on a staff.

<beatRpt> → model.eventLike.cmn → model.layerPart.cmn → model.layerPart → <layer>

**<lem>** (lemma) – Contains the lemma, or base text, of a textual variation.

<beatRpt> → model.eventLike.cmn → model.layerPart.cmn → model.layerPart → <lem>

**<oLayer>** A layer that contains an alternative to material in another layer.

<beatRpt> → model.eventLike.cmn → model.layerPart.cmn → model.layerPart → <oLayer>

**<orig>** Contains material which is marked as following the original, rather than being normalized or corrected.

<beatRpt> → model.eventLike.cmn → model.layerPart.cmn → model.layerPart → <orig>

**<rdg>** (reading) – Contains a single reading within a textual variation.

<beatRpt> → model.eventLike.cmn → model.layerPart.cmn → model.layerPart → <rdg>

**<reg>** Contains material which has been regularized or normalized in some sense.

<beatRpt> → model.eventLike.cmn → model.layerPart.cmn → model.layerPart → <reg>

**<restore>** Indicates restoration of material to an earlier state by cancellation of an editorial or authorial marking or instruction.

<beatRpt> → model.eventLike.cmn → model.layerPart.cmn → model.layerPart → <restore>

**<sic>** Contains apparently incorrect or inaccurate material.

<beatRpt> → model.eventLike.cmn → model.layerPart.cmn → model.layerPart → <sic>

**<supplied>** Contains material supplied by the transcriber or editor for any reason.

<beatRpt> → model.eventLike.cmn → model.layerPart.cmn → model.layerPart → <supplied>

**<tuplet>** A group of notes with "irregular" (sometimes called "irrational") rhythmic values, for example, three notes in the time normally occupied by two or nine in the time of five.

<beatRpt> → model.eventLike.cmn → <tuplet>

**<unclear>** Contains material that cannot be transcribed with certainty because it is illegible or inaudible in the source.

<beatRpt> → model.eventLike.cmn → model.layerPart.cmn → model.layerPart → <unclear>

## May Contain

– (<beatRpt> may not have child elements)

## Remarks

<beatRpt> may also be used in guitar or rhythm parts to indicate where chord changes occur. When these parts require durations longer or shorter than a beat; however, <note> elements with appropriately-shaped note heads should be employed.

## Declaration

```

</elementSpec>
```

## <bend>

A variation in pitch (often micro-tonal) upwards or downwards during the course of a note.

### Referenced in chapters

[4.3.5 Articulation and Performance Instructions in CMN](#), [4.3.5.2 Bend](#)

### Module

[MEI.cmn](#)

### Attributes

**@amount** (*optional*) Records the amount of detuning. The decimal values should be rendered as a fraction (or an integer plus a fraction) along with the bend symbol. Value conforms to [data.BEND.AMOUNT](#).

<bend> → [att.bend.ges](#) → @amount

**@bezier** (*optional*) Records the placement of Bezier control points as a series of pairs of space-separated values; e.g., 19 45 -32 118. One or more values, each consisting of a sequence of **decimal** and **decimal** sub-values.

<bend> → [att.bend.vis](#) → [att.curvature](#) → @bezier

**@bulge** (*optional*) Describes a curve as one or more pairs of values with respect to an imaginary line connecting the starting and ending points of the curve. The first value captures a distance to the left (positive value) or right (negative value) of the line, expressed in virtual units. The second value of each pair represents a point along the line, expressed as a percentage of the line's length. N.B. An MEI virtual unit (vu) is half the distance between adjacent staff lines where the interline space is measured from the middle of a staff line. One or more of **decimal**.

<bend> → [att.bend.vis](#) → [att.curvature](#) → @bulge

**@class** (*optional*) Contains one or more URIs which denote classification terms that apply to the entity bearing this attribute. One or more values from [data.URI](#), separated by spaces.

<bend> → [att.common](#) → [att.typed](#) → [att.classed](#) → @class

**@color** (*optional*) Used to indicate visual appearance. Do not confuse this with the musical term 'color' as used in pre-CMN notation. Value conforms to [data.COLOR](#).

<bend> → [att.bend.vis](#) → [att.color](#) → @color

**@copyof** (*optional*) Points to an element of which the current element is a copy. Value conforms to [data.URI](#).

<bend> → [att.common](#) → [att.linking](#) → @copyof

**@corresp** (*optional*) Used to point to other elements that correspond to this one in a generic fashion. One or more values from [data.URI](#), separated by spaces.

<bend> → [att.common](#) → [att.linking](#) → @corresp

**@curvedir** (*optional*) Describes a curve with a generic term indicating the direction of curvature. Allowed values are: "**above**" (*Upward curve.*), "**below**" (*Downward curve.*), "**mixed**" (*A "meandering" curve, both above and below the items it pertains to.*)

<bend> → [att.bend.vis](#) → [att.curvature](#) → @curvedir

**@dur** (*optional*) When a duration cannot be represented as a single power-of-two value, multiple space-separated values that add up to the total duration may be used. One or more values from [data.DURATION](#), separated by spaces.

<bend> → [att.bend.log](#) → [att.duration.additive](#) → @dur

**@endho** (*optional*) Records the horizontal adjustment of a feature's programmatically-determined end point. Value conforms to [data.MEASUREMENTSIGNED](#).

<bend> → [att.bend.vis](#) → [att.visualOffset2](#) → [att.visualOffset2.ho](#) → @endho

**@endid** (*optional*) Indicates the final element in a sequence of events to which the feature applies. Value conforms to [data.URI](#).

<bend> → [att.bend.log](#) → [att.startEndId](#) → @endid

**@endto** (*optional*) Records a timestamp adjustment of a feature's programmatically-determined end point. Value conforms to [data.TSTAMPOFFSET](#).

<bend> → [att.bend.vis](#) → [att.visualOffset2](#) → [att.visualOffset2.to](#) → @endto

**@endvo** (*optional*) Records a vertical adjustment of a feature's programmatically-determined end point. Value conforms to [data.MEASUREMENTSIGNED](#).

<bend> → [att.bend.vis](#) → [att.visualOffset2](#) → [att.visualOffset2.vo](#) → @endvo

**@evaluate** (*optional*) Specifies the intended meaning when a participant in a relationship is itself a pointer. Allowed values are: "**all**" (*If an element pointed to is itself a pointer, then the target of that pointer will be taken, and so on, until an element is found which is not a pointer.*), "**one**" (*If an element pointed to is itself a pointer, then its target (whether a pointer or not) is taken as the target of this pointer.*), "**none**" (*No further evaluation of targets is carried out beyond that needed to find the element(s) specified in plist or target attribute.*)

<bend> → [att.bend.log](#) → [att.controlEvent](#) → [att.targetEval](#) → @evaluate

**@facsc** (*optional*) Points to one or more images, portions of an image, or surfaces which correspond to the current element. One or more values from [data.URI](#), separated by spaces.

<bend> → [att.facsimile](#) → @facsc

**@follows** (*optional*) points to one or more events in a user-defined collection that are known to be predecessors of the current element. One or more values from [data.URI](#), separated by spaces.

<bend> → [att.common](#) → [att.linked](#) → @follows

**@ho** (*optional*) Records a horizontal adjustment to a feature's programmatically-determined location in terms of staff interline distance; that is, in units of 1/2 the distance between adjacent staff lines. Value conforms to [data.MEASUREMENTSIGNED](#).

<bend> → [att.bend.vis](#) → [att.visualOffset](#) → [att.visualOffset.ho](#) → @ho

**@label** (*optional*) Captures text to be used to generate a label for the element to which it's attached, a "tool tip" or prefatory text, for example. Should not be used to record document content. Value is plain text.

<bend> → [att.common](#) → [att.labelled](#) → @label

**@layer** (*optional*) Identifies the layer to which a feature applies. One or more values of datatype **positiveInteger**, separated by spaces.

<bend> → [att.bend.log](#) → [att.controlEvent](#) → [att.layerIdent](#) → @layer

**@lform** (*optional*) Describes the line style of a curve. Value conforms to [data.LINEFORM](#).

<bend> → [att.bend.vis](#) → [att.curveRend](#) → @lform

**@lwidth** (*optional*) Width of a curved line. Value conforms to [data.LINEWIDTH](#).

<bend> → att.bend.vis → att.curveRend → @lwidth

**@n (optional)** Provides a number-like designation that indicates an element's position in a sequence of similar elements. May not contain space characters. Value conforms to [data.WORD](#).

<bend> → att.common → att.nNumberLike → @n

**@next (optional)** Used to point to the next event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<bend> → att.common → att.linking → @next

**@part (optional)** Indicates the part in which the current feature should appear. Use '%all' when the feature should occur in every part. One or more values of datatype **a string matching the following regular expression: "(%all|#[\n\r][\c]+)"**, separated by spaces.

<bend> → att.bend.log → att.controlEvent → att.partIdent → @part

**@partstaff (optional)** Signifies the part staff on which a notated feature occurs. Use '%all' when the feature should occur on every staff. One or more values of datatype **a string matching the following regular expression: "(%all|\d+(-\d+)?)"**, separated by spaces.

<bend> → att.bend.log → att.controlEvent → att.partIdent → @partstaff

**@plist (optional)** When the target attribute is present, plist identifies the active participants; that is, those entities pointed "from", in a relationship with the specified target(s). When the target attribute is not present, it identifies participants in a mutual relationship. One or more values from [data.URI](#), separated by spaces.

<bend> → att.bend.log → att.controlEvent → att.plist → @plist

**@precedes (optional)** Points to one or more events in a user-defined collection that are known to be successors of the current element. One or more values from [data.URI](#), separated by spaces.

<bend> → att.common → att.linking → @precedes

**@prev (optional)** Points to the previous event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<bend> → att.common → att.linking → @prev

**@resp (optional)** Indicates the agent(s) responsible for some aspect of the text's transcription, editing, or encoding. Its value must point to one or more identifiers declared in the document header. One or more values from [data.URI](#), separated by spaces.

<bend> → att.common → att.responsibility → @resp

**@sameas (optional)** Points to an element that is the same as the current element but is not a literal copy of the current element. One or more values from [data.URI](#), separated by spaces.

<bend> → att.common → att.linking → @sameas

**@staff (recommended)** Signifies the staff on which a notated event occurs or to which a control event applies. Mandatory when applicable. One or more values of datatype **positiveInteger**, separated by spaces.

<bend> → att.bend.log → att.controlEvent → att.staffIdent → @staff

**@startho (optional)** Records the horizontal adjustment of a feature's programmatically-determined start point. Value conforms to [data.MEASUREMENTSIGNED](#).

<bend> → att.bend.vis → att.visualOffset2 → att.visualOffset2.ho → @startho

**@startid (optional)** Holds a reference to the first element in a sequence of events to which the feature applies. Value conforms to [data.URI](#).

<bend> → att.bend.log → att.startEndId → att.startId → @startid

**@startto** (*optional*) Records a timestamp adjustment of a feature's programmatically-determined start point. Value conforms to [data.TSTAMPOFFSET](#).

<bend> → att.bend.vis → att.visualOffset2 → att.visualOffset2.to → @startto

**@startvo** (*optional*) Records a vertical adjustment of a feature's programmatically-determined start point. Value conforms to [data.MEASUREMENTSIGNED](#).

<bend> → att.bend.vis → att.visualOffset2 → att.visualOffset2.vo → @startvo

**@synch** (*optional*) Points to elements that are synchronous with the current element. One or more values from [data.URI](#), separated by spaces.

<bend> → att.common → att.linkin → @synch

**@to** (*optional*) Records a timestamp adjustment of a feature's programmatically-determined location in terms of musical time; that is, beats. Value conforms to [data.TSTAMPOFFSET](#).

<bend> → att.bend.vis → att.visualOffset → att.visualOffset.to → @to

**@tstamp** (*optional*) Encodes the onset time in terms of musical time, i.e., beats[.fractional beat part], as expressed in the written time signature. Value conforms to [data.BEAT](#).

<bend> → att.bend.log → att.controlEvent → att.timestamp.log → @tstamp

**@tstamp.ges** (*optional*) Encodes the onset time in terms of musical time, i.e., beats[.fractional beat part], as expressed in the written time signature. Value conforms to [data.BEAT](#).

<bend> → att.bend.log → att.controlEvent → att.timestamp.ges → @tstamp.ges

**@tstamp.real** (*optional*) Records the onset time in terms of ISO time. Value conforms to [data.ISOTIME](#).

<bend> → att.bend.log → att.controlEvent → att.timestamp.ges → @tstamp.real

**@tstamp2** (*optional*) Encodes the ending point of an event, i.e., a count of measures plus a beat location in the ending measure. Value conforms to [data.MEASUREBEAT](#).

<bend> → att.bend.log → att.timestamp2.log → @tstamp2

**@tstamp2.ges** (*optional*) Encodes the ending point of an event, i.e., a count of measures plus a beat location in the ending measure. Value conforms to [data.MEASUREBEAT](#).

<bend> → att.bend.ges → att.timestamp2.ges → @tstamp2.ges

**@tstamp2.real** (*optional*) Records the ending point of an event in terms of ISO time. Value conforms to [data.ISOTIME](#).

<bend> → att.bend.ges → att.timestamp2.ges → @tstamp2.real

**@type** (*optional*) Designation which characterizes the element in some sense, using any convenient classification scheme or typology that employs single-token labels. One or more values of datatype **NMTOKEN**, separated by spaces.

<bend> → att.common → att.typed → @type

**@vo** (*optional*) Records the vertical adjustment of a feature's programmatically-determined location in terms of staff interline distance; that is, in units of 1/2 the distance between adjacent staff lines. Value conforms to [data.MEASUREMENTSIGNED](#).

<bend> → att.bend.vis → att.visualOffset → att.visualOffset.vo → @vo

**@when** (*optional*) Indicates the point of occurrence of this feature along a time line. Its value must be the ID of a [<when>](#) element elsewhere in the document. Value conforms to [data.URI](#).

<bend> → att.bend.log → att.controlEvent → att.alignment → @when

**@x** (*optional*) Encodes an x coordinate for a feature in an output coordinate system. When it is necessary to record the placement of a feature in a facsimile image, use the `facs` attribute. Value is a decimal number.

<bend> → `att.bend.vis` → `att.xy` → @x

**@x2** (*optional*) Encodes the optional 2nd x coordinate. Value is a decimal number.

<bend> → `att.bend.vis` → `att.xy2` → @x2

**@xml:base** (*optional*) Provides a base URI reference with which applications can resolve relative URI references into absolute URI references. Value conforms to [data.URI](#).

<bend> → `att.common` → `att.basic` → @xml:base

**@xml:id** (*optional*) Regularizes the naming of an element and thus facilitates building links between it and other resources. Each `id` attribute within a document must have a unique value. Value is a valid `xml:id`.

<bend> → `att.common` → `att.basic` → `att.id` → @xml:id

**@y** (*optional*) Encodes a y coordinate for a feature in an output coordinate system. When it is necessary to record the placement of a feature in a facsimile image, use the `facs` attribute. Value is a decimal number.

<bend> → `att.bend.vis` → `att.xy` → @y

**@y2** (*optional*) Encodes the optional 2nd y coordinate. Value is a decimal number.

<bend> → `att.bend.vis` → `att.xy2` → @y2

## Member of

[model.controlEventLike](#) Groups elements, such as dynamics, ties, phrase marks, pedal marks, etc., which depend upon other events, such as notes or rests, for their existence.

## Contained By

**<abbr>** A generic element for 1) a shortened form of a word, including an acronym or 2) a shorthand notation.

<bend> → `model.controlEventLike` → `model.editTransPart.music` → `model.editTransPart` → <abbr>

**<add>** Marks an addition to the text.

<bend> → `model.controlEventLike` → `model.editTransPart.music` → `model.editTransPart` → <add>

**<corr>** Contains the correct form of an apparent erroneous passage.

<bend> → `model.controlEventLike` → `model.editTransPart.music` → `model.editTransPart` → <corr>

**<damage>** Contains an area of damage to the physical medium.

<bend> → `model.controlEventLike` → `model.editTransPart.music` → `model.editTransPart` → <damage>

**<del>** Contains information deleted, marked as deleted, or otherwise indicated as superfluous or spurious in the copy text by an author, scribe, annotator, or corrector.

<bend> → `model.controlEventLike` → `model.editTransPart.music` → `model.editTransPart` → <del>

**<expan>** Contains the expansion of an abbreviation.

<bend> → `model.controlEventLike` → `model.editTransPart.music` → `model.editTransPart` → <expan>

**<lem>** (lemma) – Contains the lemma, or base text, of a textual variation.

<bend> → `model.controlEventLike` → `model.rdgPart.music` → `model.rdgPart` → <lem>

**<measure>** Unit of musical time consisting of a fixed number of note values of a given type, as determined by the prevailing meter, and delimited in musical notation by bar lines.

<bend> → model.controlEventLike → model.measurePart → <measure>

**<oStaff>** A staff that holds an alternative passage which may be played instead of the original material.

<bend> → model.controlEventLike → model.staffPart.mensural → model.staffPart.mensuralAndNeumes → model.staffPart → <oStaff>

**<orig>** Contains material which is marked as following the original, rather than being normalized or corrected.

<bend> → model.controlEventLike → model.editTransPart.music → model.editTransPart → <orig>

**<rdg>** (reading) – Contains a single reading within a textual variation.

<bend> → model.controlEventLike → model.rdgPart.music → model.rdgPart → <rdg>

**<reg>** Contains material which has been regularized or normalized in some sense.

<bend> → model.controlEventLike → model.editTransPart.music → model.editTransPart → <reg>

**<restore>** Indicates restoration of material to an earlier state by cancellation of an editorial or authorial marking or instruction.

<bend> → model.controlEventLike → model.editTransPart.music → model.editTransPart → <restore>

**<sic>** Contains apparently incorrect or inaccurate material.

<bend> → model.controlEventLike → model.editTransPart.music → model.editTransPart → <sic>

**<staff>** A group of equidistant horizontal lines on which notes are placed in order to represent pitch or a grouping element for individual 'strands' of notes, rests, etc. that may or may not actually be rendered on staff lines; that is, both diastematic and non-diastematic signs.

<bend> → model.controlEventLike → model.staffPart.mensural → model.staffPart.mensuralAndNeumes → model.staffPart → <staff>

**<supplied>** Contains material supplied by the transcriber or editor for any reason.

<bend> → model.controlEventLike → model.editTransPart.music → model.editTransPart → <supplied>

**<syllable>** Neume notation can be thought of as "neumed text". Therefore, the syllable element provides high-level organization in this repertoire.

<bend> → model.controlEventLike → model.syllablePart → <syllable>

**<unclear>** Contains material that cannot be transcribed with certainty because it is illegible or inaudible in the source.

<bend> → model.controlEventLike → model.editTransPart.music → model.editTransPart → <unclear>

## May Contain

– (<bend> may not have child elements)

## Constraints

Must have one of the attributes: startid, tstamp, tstamp.ges or tstamp.real.

Must have one of the attributes: dur, dur.ges, endid, or tstamp2.

## Declaration

```
<elementSpec ident="bend" module="MEI.cmn">

</elementSpec>
```

## <bibl>

(bibliographic reference) – Provides a loosely-structured bibliographic citation in which the sub-components may or may not be explicitly marked.

### Referenced in chapters

[3.3.2 Responsibility Attribution](#), [3.4.1.6 Source Description](#), [9.2.12 Bibliographic Citations and References](#),  
[9.2.12.1 Related Items](#)

### Module

[MEI.shared](#)

### Attributes

**@analog** (*optional*) Contains a reference to a field or element in another descriptive encoding system to which this MEI element is comparable. Value is plain text.

<bibl> → [att.bibl](#) → @analog

**@class** (*optional*) Contains one or more URIs which denote classification terms that apply to the entity bearing this attribute. One or more values from [data.URI](#), separated by spaces.

<bibl> → [att.common](#) → [att.typed](#) → [att.classed](#) → @class

**@copyof** (*optional*) Points to an element of which the current element is a copy. Value conforms to [data.URI](#).

<bibl> → [att.common](#) → [att.linkin](#) → @copyof

**@corresp** (*optional*) Used to point to other elements that correspond to this one in a generic fashion. One or more values from [data.URI](#), separated by spaces.

<bibl> → [att.common](#) → [att.linkin](#) → @corresp

**@facs** (*optional*) Points to one or more images, portions of an image, or surfaces which correspond to the current element. One or more values from [data.URI](#), separated by spaces.

<bibl> → [att.facsimile](#) → @facs

**@follows** (*optional*) points to one or more events in a user-defined collection that are known to be predecessors of the current element. One or more values from [data.URI](#), separated by spaces.

<bibl> → [att.common](#) → [att.linkin](#) → @follows

**@label** (*optional*) Captures text to be used to generate a label for the element to which it's attached, a "tool tip" or prefatory text, for example. Should not be used to record document content. Value is plain text.

<bibl> → [att.common](#) → [att.labelled](#) → @label

**@n** (*optional*) Provides a number-like designation that indicates an element's position in a sequence of similar elements. May not contain space characters. Value conforms to [data.WORD](#).

<bibl> → [att.common](#) → [att.nNumberLike](#) → @n

**@next** (*optional*) Used to point to the next event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<bibl> → [att.common](#) → [att.linkin](#) → @next

**@precedes** (*optional*) Points to one or more events in a user-defined collection that are known to be successors of the current element. One or more values from [data.URI](#), separated by spaces.

<bibl> → att.common → att.linkin → @precedes

**@prev** (*optional*) Points to the previous event(s) in a user-defined collection. One or more values from data.URI, separated by spaces.

<bibl> → att.common → att.linkin → @prev

**@resp** (*optional*) Indicates the agent(s) responsible for some aspect of the text's transcription, editing, or encoding. Its value must point to one or more identifiers declared in the document header. One or more values from data.URI, separated by spaces.

<bibl> → att.common → att.responsibility → @resp

**@sameas** (*optional*) Points to an element that is the same as the current element but is not a literal copy of the current element. One or more values from data.URI, separated by spaces.

<bibl> → att.common → att.linkin → @sameas

**@synch** (*optional*) Points to elements that are synchronous with the current element. One or more values from data.URI, separated by spaces.

<bibl> → att.common → att.linkin → @synch

**@target** (*optional*) Identifies passive participants in a relationship; that is, the entities pointed "to". One or more values from data.URI, separated by spaces.

<bibl> → att.pointing → @target

**@targettype** (*optional*) Characterization of target resource(s) using any convenient classification scheme or typology. Value is a NMTOKEN.

<bibl> → att.pointing → @targettype

**@translit** (*optional*) Specifies the transliteration technique used. Value is a NMTOKEN.

<bibl> → att.lang → @translit

**@type** (*optional*) Designation which characterizes the element in some sense, using any convenient classification scheme or typology that employs single-token labels. One or more values of datatype NMTOKEN, separated by spaces.

<bibl> → att.common → att.typed → @type

**@xlink:actuate** (*optional*) Defines whether a link occurs automatically or must be requested by the user. Allowed values are: "onLoad" (*Load the target resource(s) immediately.*), "onRequest" (*Load the target resource(s) upon user request.*), "none" (*Do not permit loading of the target resource(s).*), "other" (*Behavior other than allowed by the other values of this attribute.*)

<bibl> → att.pointing → @xlink:actuate

**@xlink:role** (*optional*) Characterization of the relationship between resources. The value of the role attribute must be a URI. Value conforms to data.URI.

<bibl> → att.pointing → @xlink:role

**@xlink:show** (*optional*) Defines how a remote resource is rendered. Allowed values are: "new" (*Open in a new window.*), "replace" (*Load the referenced resource in the same window.*), "embed" (*Embed the referenced resource at the point of the link.*), "none" (*Do not permit traversal to the referenced resource.*), "other" (*Behavior other than permitted by the other values of this attribute.*)

<bibl> → att.pointing → @xlink:show

**@xml:base** (*optional*) Provides a base URI reference with which applications can resolve relative URI references into absolute URI references. Value conforms to data.URI.

<bibl> → att.common → att.basic → @xml:base

**@xml:id** (*optional*) Regularizes the naming of an element and thus facilitates building links between it and other resources. Each id attribute within a document must have a unique value. Value is a valid `xml:id`.

<bibl> → `att.common` → `att.basic` → `att.id` → `@xml:id`

**@xml:lang** (*optional*) Identifies the language of the element's content. The values for this attribute are language 'tags' as defined in BCP 47. All language tags that make use of private use sub-tags must be documented in a corresponding language element in the MEI header whose id attribute is the same as the language tag's value. Value is a [language](#).

<bibl> → `att.lang` → `@xml:lang`

## Member of

[model.biblLike](#) Groups elements containing a bibliographic description.

## Contained By

**<abbr>** A generic element for 1) a shortened form of a word, including an acronym or 2) a shorthand notation.

<bibl> → `model.biblLike` → `model.textPhraseLike.limited` → `model.editTransPart.text` → `model.editTransPart` → `<abbr>`

**<acquisition>** Records information concerning the process by which an item was acquired by the holding institution.

<bibl> → `model.biblLike` → `model.textPhraseLike.limited` → `<acquisition>`

**<actor>** Name of an actor appearing within a cast list.

<bibl> → `model.biblLike` → `model.textPhraseLike.limited` → `<actor>`

**<add>** Marks an addition to the text.

<bibl> → `model.biblLike` → `model.textPhraseLike.limited` → `model.editTransPart.text` → `model.editTransPart` → `<add>`

**<addName>** Contains an additional name component, such as a nickname, epithet, or alias, or any other descriptive phrase used within a personal name.

<bibl> → `model.biblLike` → `model.textPhraseLike.limited` → `model.textPhraseLike` → `<addName>`

**<addrLine>** Single line of a postal address.

<bibl> → `model.biblLike` → `model.textPhraseLike.limited` → `model.textPhraseLike` → `<addrLine>`

**<anchoredText>** Container for text that is fixed to a particular page location, regardless of changes made to the layout of the measures around it.

<bibl> → `model.biblLike` → `model.textPhraseLike.limited` → `<anchoredText>`

**<annot>** Provides a statement explaining the text or indicating the basis for an assertion.

<bibl> → `model.biblLike` → `model.textPhraseLike.limited` → `model.textPhraseLike` → `<annot>`

**<arranger>** A person or organization who transcribes a musical composition, usually for a different medium from that of the original; in an arrangement the musical substance remains essentially unchanged.

<bibl> → `model.biblLike` → `model.textPhraseLike.limited` → `<arranger>`

**<attacca>** An instruction to begin the next section or movement of a composition without pause.

<bibl> → `model.biblLike` → `model.textPhraseLike.limited` → `<attacca>`

**<author>** The name of the creator of the intellectual content of a non-musical, literary work.

<bibl> → `model.biblLike` → `model.textPhraseLike.limited` → `<author>`

**<bibl>** Provides a loosely-structured bibliographic citation in which the sub-components may or may not be explicitly marked.

<bibl> → model.biblLike → model.textPhraseLike.limited → model.textPhraseLike → <bibl>

**<biblList>** List of bibliographic references.

<bibl> → model.biblLike → <biblList>

**<biblScope>** Defines the scope of a bibliographic reference, for example as a list of page numbers, or a named subdivision of a larger work.

<bibl> → model.biblLike → model.textPhraseLike.limited → <biblScope>

**<bindingDesc>** Describes the present and former bindings of an item.

<bibl> → model.biblLike → model.textPhraseLike.limited → <bindingDesc>

**<bloc>** Contains the name of a geopolitical unit consisting of two or more nation states or countries.

<bibl> → model.biblLike → model.textPhraseLike.limited → model.textPhraseLike → <bloc>

**<bracketSpan>** Marks a sequence of notational events grouped by a bracket.

<bibl> → model.biblLike → model.textPhraseLike.limited → <bracketSpan>

**<byline>** Contains the primary statement of responsibility given for a work on its title page.

<bibl> → model.biblLike → model.textPhraseLike.limited → <byline>

**<caption>** A label which accompanies an illustration or a table.

<bibl> → model.biblLike → model.textPhraseLike.limited → model.textPhraseLike → <caption>

**<composer>** The name of the creator of the intellectual content of a musical work.

<bibl> → model.biblLike → model.textPhraseLike.limited → <composer>

**<contentItem>** Contains a single entry within a content description element.

<bibl> → model.biblLike → model.textPhraseLike.limited → model.textPhraseLike → <contentItem>

**<contributor>** Names of individuals, institutions, or organizations responsible for contributions to the intellectual content of a work, where the specialized elements for authors, editors, etc. do not suffice or do not apply.

<bibl> → model.biblLike → model.textPhraseLike.limited → <contributor>

**<corpName>** Identifies an organization or group of people that acts as a single entity.

<bibl> → model.biblLike → model.textPhraseLike.limited → model.textPhraseLike → <corpName>

**<corr>** Contains the correct form of an apparent erroneous passage.

<bibl> → model.biblLike → model.textPhraseLike.limited → model.editTransPart.text → model.editTransPart → <corr>

**<country>** Contains the name of a geopolitical unit, such as a nation, country, colony, or commonwealth, larger than or administratively superior to a region and smaller than a bloc.

<bibl> → model.biblLike → model.textPhraseLike.limited → model.textPhraseLike → <country>

**<cpMark>** A verbal or graphical indication to copy musical material written elsewhere.

<bibl> → model.biblLike → model.textPhraseLike.limited → <cpMark>

**<creation>** Non-bibliographic details of the creation of an intellectual entity, in narrative form, such as the date, place, and circumstances of its composition. More detailed information may be captured within the history element.

<bibl> → model.biblLike → model.textPhraseLike.limited → <creation>

**<damage>** Contains an area of damage to the physical medium.

<bibl> → model.biblLike → model.textPhraseLike.limited → model.editTransPart.text → model.editTransPart → <damage>

**<date>** A string identifying a point in time or the time period between two such points.

<bibl> → model.biblLike → model.textPhraseLike.limited → model.textPhraseLike → <date>

**<decoDesc>** Contains a description of the decoration of an item.

<bibl> → model.biblLike → model.textPhraseLike.limited → <decoDesc>

**<decoNote>** Contains a description of one or more decorative features of an item.

<bibl> → model.biblLike → model.textPhraseLike.limited → <decoNote>

**<dedicatee>** Entity to whom a creative work is formally offered.

<bibl> → model.biblLike → model.textPhraseLike.limited → <dedicatee>

**<dedication>** Contains a dedicatory statement.

<bibl> → model.biblLike → model.textPhraseLike.limited → <dedication>

**<del>** Contains information deleted, marked as deleted, or otherwise indicated as superfluous or spurious in the copy text by an author, scribe, annotator, or corrector.

<bibl> → model.biblLike → model.textPhraseLike.limited → model.editTransPart.text → model.editTransPart → <del>

**<depth>** Description of a measurement taken through a three-dimensional object.

<bibl> → model.biblLike → model.textPhraseLike.limited → <depth>

**<desc>** Container for text that briefly describes the feature to which it is attached, including its intended usage, purpose, or application as appropriate.

<bibl> → model.biblLike → model.textPhraseLike.limited → <desc>

**<dim>** Any single dimensional specification.

<bibl> → model.biblLike → model.textPhraseLike.limited → <dim>

**<dir>** An instruction expressed as a combination of text and symbols, typically above, below, or between staves, but not on the staff — that is not encoded elsewhere in more specific elements, like **<tempo>**, **<dynam>** or **<repeatMark>**.

<bibl> → model.biblLike → model.textPhraseLike.limited → <dir>

**<distributor>** Person or agency, other than a publisher, from which access (including electronic access) to a bibliographic entity may be obtained.

<bibl> → model.biblLike → model.textPhraseLike.limited → <distributor>

**<district>** Contains the name of any kind of subdivision of a settlement, such as a parish, ward, or other administrative or geographic unit.

<bibl> → model.biblLike → model.textPhraseLike.limited → model.textPhraseLike → <district>

**<dynam>** Indication of the volume of a note, phrase, or section of music.

<bibl> → model.biblLike → model.textPhraseLike.limited → <dynam>

**<edition>** A word or text phrase that indicates a difference in either content or form between the item being described and a related item previously issued by the same publisher/distributor (e.g., 2nd edition, version 2.0, etc.), or simultaneously issued by either the same publisher/distributor or another publisher/distributor (e.g., large print edition, British edition, etc.).

<bibl> → model.biblLike → model.textPhraseLike.limited → <edition>

**<editor>** The name of the individual(s), institution(s) or organization(s) acting in an editorial capacity.

<bibl> → model.biblLike → model.textPhraseLike.limited → <editor>

**<epigraph>** Contains a quotation, anonymous or attributed, appearing on a title page.

<bibl> → model.biblLike → model.textPhraseLike.limited → model.textPhraseLike → model.paracontentPart → <epigraph>

**<exhibHist>** A record of public exhibitions, including dates, venues, etc.

<bibl> → model.biblLike → model.textPhraseLike.limited → <exhibHist>

**<expan>** Contains the expansion of an abbreviation.

<bibl> → model.biblLike → model.textPhraseLike.limited → model.editTransPart.text → model.editTransPart → <expan>

**<extent>** Used to express size in terms other than physical dimensions, such as number of pages, records, bytes, physical components, etc.

<bibl> → model.biblLike → model.textPhraseLike.limited → <extent>

**<f>** Single element of a figured bass indication.

<bibl> → model.biblLike → model.textPhraseLike.limited → <f>

**<famName>** Contains a family (inherited) name, as opposed to a given, baptismal, or nick name.

<bibl> → model.biblLike → model.textPhraseLike.limited → model.textPhraseLike → <famName>

**<figDesc>** Contains a brief prose description of the appearance or content of a graphic figure, for use when documenting an image without displaying it.

<bibl> → model.biblLike → model.textPhraseLike.limited → <figDesc>

**<fing>** finger – An individual finger in a fingering indication.

<bibl> → model.biblLike → model.textPhraseLike.limited → <fing>

**<foreName>** Contains a forename, given or baptismal name.

<bibl> → model.biblLike → model.textPhraseLike.limited → model.textPhraseLike → <foreName>

**<funder>** Names of individuals, institutions, or organizations responsible for funding. Funders provide financial support for a project; they are distinct from sponsors, who provide intellectual support and authority.

<bibl> → model.biblLike → model.textPhraseLike.limited → <funder>

**<genName>** Contains a name component used to distinguish otherwise similar names on the basis of the relative ages or generations of the persons named.

<bibl> → model.biblLike → model.textPhraseLike.limited → model.textPhraseLike → <genName>

**<genre>** Term or terms that designate a category characterizing a particular style, form, or content.

<bibl> → model.biblLike → model.textPhraseLike.limited → <genre>

**<geogFeat>** Contains a common noun identifying a geographical feature.

<bibl> → model.biblLike → model.textPhraseLike.limited → model.textPhraseLike → <geogFeat>

**<geogName>** The proper noun designation for a place, natural feature, or political jurisdiction.

<bibl> → model.biblLike → model.textPhraseLike.limited → model.textPhraseLike → <geogName>

**<gliss>** A continuous or sliding movement from one pitch to another, usually indicated by a straight or wavy line.

<bibl> → model.biblLike → model.textPhraseLike.limited → <gliss>

**<hand>** Defines a distinct scribe or handwriting style.

<bibl> → model.biblLike → model.textPhraseLike.limited → <hand>

**<harm>** An indication of harmony, e.g., chord names, tablature grids, harmonic analysis, figured bass.

<bibl> → model.biblLike → model.textPhraseLike.limited → <harm>

**<head>** Contains any heading, for example, the title of a section of text, or the heading of a list.

<bibl> → model.biblLike → model.textPhraseLike.limited → model.textPhraseLike → <head>

**<height>** Description of the vertical size of an object.

<bibl> → model.biblLike → model.textPhraseLike.limited → <height>

**<identifier>** An alpha-numeric string that establishes the identity of the described material.

<bibl> → model.biblLike → model.textPhraseLike.limited → model.textPhraseLike → <identifier>

**<imprimatur>** Contains a formal statement authorizing the publication of a work, sometimes required to appear on a title page or its verso.

<bibl> → model.biblLike → model.textPhraseLike.limited → model.textPhraseLike → model.paracontentPart → <imprimatur>

**<imprint>** Information relating to the publication or distribution of a bibliographic item.

<bibl> → model.biblLike → model.textPhraseLike.limited → model.textPhraseLike → <imprint>

**<l>** Contains a single line of text within a line group.

<bibl> → model.biblLike → model.textPhraseLike.limited → model.textPhraseLike → <l>

**<label>** A container for document text that identifies the feature to which it is attached. For a "tool tip" or other generated label, use the label attribute.

<bibl> → model.biblLike → model.textPhraseLike.limited → <label>

**<labelAbbr>** A label on the pages following the first.

<bibl> → model.biblLike → model.textPhraseLike.limited → <labelAbbr>

**<language>** Description of a language used in the document.

<bibl> → model.biblLike → model.textPhraseLike.limited → <language>

**<layoutDesc>** Collects layout descriptions.

<bibl> → model.biblLike → model.textPhraseLike.limited → <layoutDesc>

**<lem>** (lemma) – Contains the lemma, or base text, of a textual variation.

<bibl> → model.biblLike → model.textPhraseLike.limited → model.rdgPart.text → model.rdgPart → <lem>

**<li>** Single item in a <list>.

<bibl> → model.biblLike → model.textPhraseLike.limited → model.textPhraseLike → <li>

**<librettist>** Person or organization who is a writer of the text of an opera, oratorio, etc.

<bibl> → model.biblLike → model.textPhraseLike.limited → <librettist>

**<line>** A visual line that cannot be represented by a more specific; i.e., semantic, element.

<bibl> → model.biblLike → model.textPhraseLike.limited → <line>

**<lyricist>** Person or organization who is a writer of the text of a song.

<bibl> → model.biblLike → model.textPhraseLike.limited → <lyricist>

**<metaMark>** A graphical or textual statement with additional / explanatory information about the musical text. The textual consequences of this intervention are encoded independently via other means; that is, with elements such as <add>, <del>, etc.

<bibl> → model.biblLike → model.textPhraseLike.limited → <metaMark>

**<name>** Proper noun or noun phrase.

<bibl> → model.biblLike → model.textPhraseLike.limited → model.textPhraseLike → <name>

**<nameLink>** Contains a connecting phrase or link used within a name but not regarded as part of it, such as "van der" or "of", "from", etc.

<bibl> → model.biblLike → model.textPhraseLike.limited → model.textPhraseLike → <nameLink>

**<num>** Numeric information in any form.

<bibl> → model.biblLike → model.textPhraseLike.limited → model.textPhraseLike → <num>

**<octave>** An indication that a passage should be performed one or more octaves above or below its written pitch.

<bibl> → model.biblLike → model.textPhraseLike.limited → <octave>

**<orig>** Contains material which is marked as following the original, rather than being normalized or corrected.

<bibl> → model.biblLike → model.textPhraseLike.limited → model.editTransPart.text → model.editTransPart → <orig>

**<ornam>** An element indicating an ornament that is not a mordent, turn, or trill.

<bibl> → model.biblLike → model.textPhraseLike.limited → <ornam>

**<p>** One or more text phrases that form a logical prose passage.

<bibl> → model.biblLike → model.textPhraseLike.limited → model.textPhraseLike → model.paracontentPart → <p>

**<perfRes>** Name of an instrument on which a performer plays, a performer's voice range, or a standard performing ensemble designation.

<bibl> → model.biblLike → model.textPhraseLike.limited → <perfRes>

**<periodName>** A label that describes a period of time, such as 'Baroque' or '3rd Style period'.

<bibl> → model.biblLike → model.textPhraseLike.limited → model.textPhraseLike → <periodName>

**<persName>** Designation for an individual, including any or all of that individual's forenames, surnames, honorific titles, and added names.

<bibl> → model.biblLike → model.textPhraseLike.limited → model.textPhraseLike → <persName>

**<pgFoot>** A running footer.

<bibl> → model.biblLike → model.textPhraseLike.limited → <pgFoot>

**<pgHead>** A running header.

<bibl> → model.biblLike → model.textPhraseLike.limited → <pgHead>

**<price>** The cost of access to a bibliographic item.

<bibl> → model.biblLike → model.textPhraseLike.limited → <price>

**<provenance>** The record of ownership or custodianship of an item.

<bibl> → model.biblLike → model.textPhraseLike.limited → <provenance>

**<pubPlace>** Name of the place where a bibliographic item was published.

<bibl> → model.biblLike → model.textPhraseLike.limited → <pubPlace>

**<publisher>** Name of the organization responsible for the publication of a bibliographic item.

<bibl> → model.biblLike → model.textPhraseLike.limited → <publisher>

**<q>** Contains material which is distinguished from the surrounding phrase-level text using quotation marks or a similar method. Use <quote> for block-level quotations.

<bibl> → model.biblLike → model.textPhraseLike.limited → model.textPhraseLike → <q>

**<quote>** Contains a paragraph-like block of text attributed to an external source, normally set off from the surrounding text by spacing or other typographic distinction.

<bibl> → model.biblLike → model.textPhraseLike.limited → model.textPhraseLike → model.paracontentPart → <quote>

**<rdg>** (reading) – Contains a single reading within a textual variation.

<bibl> → model.biblLike → model.textPhraseLike.limited → model.rdgPart.text → model.rdgPart → <rdg>

**<recipient>** The name of the individual(s), institution(s) or organization(s) receiving correspondence.

<bibl> → model.biblLike → model.textPhraseLike.limited → <recipient>

**<ref>** Defines a traversible reference to another location. May contain text and sub-elements that describe the destination.

<bibl> → model.biblLike → model.textPhraseLike.limited → model.textPhraseLike → <ref>

**<reg>** Contains material which has been regularized or normalized in some sense.

<bibl> → model.biblLike → model.textPhraseLike.limited → model.editTransPart.text → model.editTransPart → <reg>

**<region>** Contains the name of an administrative unit such as a state, province, or county, larger than a settlement, but smaller than a country.

<bibl> → model.biblLike → model.textPhraseLike.limited → model.textPhraseLike → <region>

**<relatedItem>** Contains or references another bibliographic item which is related to the present one.

<bibl> → model.biblLike → <relatedItem>

**<rend>** A formatting element indicating special visual rendering, e.g., bold or italicized, of a text word or phrase.

<bibl> → model.biblLike → model.textPhraseLike.limited → model.textPhraseLike → <rend>

**<repeatMark>** An instruction expressed as a combination of text and symbols – segno and coda – typically above, below, or between staves, but not on the staff.

<bibl> → model.biblLike → model.textPhraseLike.limited → <repeatMark>

**<repository>** Institution, agency, or individual which holds a bibliographic item.

<bibl> → model.biblLike → model.textPhraseLike.limited → <repository>

**<resp>** A phrase describing the nature of intellectual responsibility.

<bibl> → model.biblLike → model.textPhraseLike.limited → <resp>

**<restore>** Indicates restoration of material to an earlier state by cancellation of an editorial or authorial marking or instruction.

<bibl> → model.biblLike → model.textPhraseLike.limited → model.editTransPart.text → model.editTransPart → <restore>

**<role>** Name of a dramatic role, as given in a cast list.

<bibl> → model.biblLike → model.textPhraseLike.limited → <role>

**<roleDesc>** Describes a character's role in a drama.

<bibl> → model.biblLike → model.textPhraseLike.limited → <roleDesc>

**<roleName>** Contains a name component which indicates that the referent has a particular role or position in society, such as an official title or rank.

<bibl> → model.biblLike → model.textPhraseLike.limited → model.textPhraseLike → <roleName>

**<scriptDesc>** Contains a description of the letters or characters used in an autographic item.

<bibl> → model.biblLike → model.textPhraseLike.limited → <scriptDesc>

**<seal>** A single seal or similar attachment.

<bibl> → model.biblLike → model.textPhraseLike.limited → <seal>

**<sealDesc>** Describes the seals or similar external attachments applied to an item.

<bibl> → model.biblLike → model.textPhraseLike.limited → <sealDesc>

**<seg>** (arbitrary segment) represents any segmentation of text below the "text component" level.

<bibl> → model.biblLike → model.textPhraseLike.limited → model.textPhraseLike → <seg>

**<settlement>** Contains the name of a settlement such as a city, town, or village identified as a single geopolitical or administrative unit.

<bibl> → model.biblLike → model.textPhraseLike.limited → model.textPhraseLike → <settlement>

**<sic>** Contains apparently incorrect or inaccurate material.

<bibl> → model.biblLike → model.textPhraseLike.limited → model.editTransPart.text → model.editTransPart → <sic>

**<signifLet>** Significantive letter(s).

<bibl> → model.biblLike → model.textPhraseLike.limited → <signifLet>

**<soundChan>** Reflects the number of apparent sound channels in the playback of a recording (monaural, stereophonic, quadraphonic, etc.).

<bibl> → model.biblLike → model.textPhraseLike.limited → <soundChan>

**<source>** A bibliographic description of a source used in the creation of the electronic file.

<bibl> → model.biblLike → <source>

**<speaker>** Contains a specialized form of heading or label, giving the name of one or more speakers in a dramatic text or fragment.

<bibl> → model.biblLike → model.textPhraseLike.limited → <speaker>

**<sponsor>** Names of sponsoring individuals, organizations or institutions. Sponsors give their intellectual authority to a project; they are to be distinguished from funders, who provide the funding but do not necessarily take intellectual responsibility.

<bibl> → model.biblLike → model.textPhraseLike.limited → <sponsor>

**<stack>** An inline table with a single column.

<bibl> → model.biblLike → model.textPhraseLike.limited → <stack>

**<stageDir>** Contains any kind of stage direction within a dramatic text or fragment.

<bibl> → model.biblLike → model.textPhraseLike.limited → <stageDir>

**<street>** full street address including any name or number identifying a building as well as the name of the street or route on which it is located.

<bibl> → model.biblLike → model.textPhraseLike.limited → model.textPhraseLike → <street>

**<styleName>** A label for a characteristic style of writing or performance, such as 'bebop' or 'rock-n-roll'.

<bibl> → model.biblLike → model.textPhraseLike.limited → model.textPhraseLike → <styleName>

**<supplied>** Contains material supplied by the transcriber or editor for any reason.

<bibl> → model.biblLike → model.textPhraseLike.limited → model.editTransPart.text → model.editTransPart → <supplied>

**<supportDesc>** Groups elements describing the physical support material of an item.

<bibl> → model.biblLike → model.textPhraseLike.limited → <supportDesc>

**<syl>** Individual lyric syllable.

<bibl> → model.biblLike → model.textPhraseLike.limited → <syl>

**<taxonomy>** Defines a typology either implicitly, by means of a bibliographic citation, or explicitly by a structured taxonomy.

<bibl> → model.biblLike → <taxonomy>

**<td>** Designates a table cell that contains data as opposed to a cell that contains column or row heading information.

<bibl> → model.biblLike → model.textPhraseLike.limited → model.textPhraseLike → <td>

**<tempo>** Text and symbols descriptive of tempo, mood, or style, e.g., "allarg.", "a tempo", "cantabile", "Moderato", "J=60", "Moderato J =60").

<bibl> → model.biblLike → model.textPhraseLike.limited → <tempo>

**<term>** Keyword or phrase which describes a resource.

<bibl> → model.biblLike → model.textPhraseLike.limited → <term>

**<textLang>** Identifies the languages and writing systems within the work described by a bibliographic description, not the language of the description.

<bibl> → model.biblLike → model.textPhraseLike.limited → <textLang>

**<th>** Designates a table cell containing column or row heading information as opposed to one containing data.

<bibl> → model.biblLike → model.textPhraseLike.limited → model.textPhraseLike → <th>

**<treatHist>** A record of the treatment the item has undergone (e.g., de-acidification, restoration, etc.).

<bibl> → model.biblLike → model.textPhraseLike.limited → <treatHist>

**<treatSched>** Scheduled treatment, e.g., de-acidification, restoration, etc., for an item.

<bibl> → model.biblLike → model.textPhraseLike.limited → <treatSched>

**<typeDesc>** Contains a description of the typefaces or other aspects of the printing of a printed source.

<bibl> → model.biblLike → model.textPhraseLike.limited → <typeDesc>

**<unclear>** Contains material that cannot be transcribed with certainty because it is illegible or inaudible in the source.

<bibl> → model.biblLike → model.textPhraseLike.limited → model.editTransPart.text → model.editTransPart → <unclear>

**<width>** Description of the horizontal size of an object.

<bibl> → model.biblLike → model.textPhraseLike.limited → <width>

## May Contain

**<abbr>** A generic element for 1) a shortened form of a word, including an acronym or 2) a shorthand notation.

<bibl> → model.textPhraseLike → model.textPhraseLike.limited → model.editorialLike → <abbr>

**<address>** Contains a postal address, for example of a publisher, an organization, or an individual.

<bibl> → model.textPhraseLike → model.textPhraseLike.limited → model.addressLike → <address>

**<annot>** Provides a statement explaining the text or indicating the basis for an assertion.

<bibl> → model.textPhraseLike → model.textPhraseLike.limited → model.annotLike → <annot>

**<arranger>** A person or organization who transcribes a musical composition, usually for a different medium from that of the original; in an arrangement the musical substance remains essentially unchanged.

<bibl> → model.biblPart → model.respLike → model.respLikePart → <arranger>

**<author>** The name of the creator of the intellectual content of a non-musical, literary work.

<bibl> → model.biblPart → model.respLike → model.respLikePart → <author>

**<availability>** Groups elements that describe the availability of and access to a bibliographic item, including an MEI-encoded document.

<bibl> → model.imprintPart → <availability>

**<bibl>** Provides a loosely-structured bibliographic citation in which the sub-components may or may not be explicitly marked.

<bibl> → model.textPhraseLike → model.textPhraseLike.limited → model.biblLike → <bibl>

**<biblScope>** Defines the scope of a bibliographic reference, for example as a list of page numbers, or a named subdivision of a larger work.

<bibl> → model.biblPart → <biblScope>

**<biblStruct>** Contains a bibliographic citation in which bibliographic sub-elements must appear in a specified order.

<bibl> → model.textPhraseLike → model.textPhraseLike.limited → model.biblLike → <biblStruct>

**<bloc>** Contains the name of a geopolitical unit consisting of two or more nation states or countries.

<bibl> → model.textPhraseLike → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <bloc>

**<catchwords>** Describes the system used to ensure correct ordering of the quires making up an item, typically by means of annotations at the foot of the page.

<bibl> → model.textPhraseLike → model.textPhraseLike.limited → model.mslinline → <catchwords>

**<composer>** The name of the creator of the intellectual content of a musical work.

<bibl> → model.biblPart → model.respLike → model.respLikePart → <composer>

**<contributor>** Names of individuals, institutions, or organizations responsible for contributions to the intellectual content of a work, where the specialized elements for authors, editors, etc. do not suffice or do not apply.

<bibl> → model.biblPart → model.respLike → model.respLikePart → <contributor>

**<corpName>** Identifies an organization or group of people that acts as a single entity.

<bibl> → model.textPhraseLike → model.textPhraseLike.limited → model.nameLike → model.nameLike.agent → <corpName>

**<country>** Contains the name of a geopolitical unit, such as a nation, country, colony, or commonwealth, larger than or administratively superior to a region and smaller than a bloc.

<bibl> → model.textPhraseLike → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <country>

**<creation>** Non-bibliographic details of the creation of an intellectual entity, in narrative form, such as the date, place, and circumstances of its composition. More detailed information may be captured within the history element.

<bibl> → model.biblPart → <creation>

**<date>** A string identifying a point in time or the time period between two such points.

<bibl> → model.textPhraseLike → model.textPhraseLike.limited → model.dateLike → <date>

**<dedicpee>** Entity to whom a creative work is formally offered.

<bibl> → model.textPhraseLike → model.textPhraseLike.limited → <dedicpee>

**<depth>** Description of a measurement taken through a three-dimensional object.

<bibl> → model.textPhraseLike → model.textPhraseLike.limited → model.dimLike → <depth>

**<dim>** Any single dimensional specification.

<bibl> → model.textPhraseLike → model.textPhraseLike.limited → model.dimLike → <dim>

**<dimensions>** Information about the physical size of an entity; usually includes numerical data.

<bibl> → model.textPhraseLike → model.textPhraseLike.limited → <dimensions>

**<distributor>** Person or agency, other than a publisher, from which access (including electronic access) to a bibliographic entity may be obtained.

<bibl> → model.imprintPart → <distributor>

**<district>** Contains the name of any kind of subdivision of a settlement, such as a parish, ward, or other administrative or geographic unit.

<bibl> → model.textPhraseLike → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <district>

**<edition>** A word or text phrase that indicates a difference in either content or form between the item being described and a related item previously issued by the same publisher/distributor (e.g., 2nd edition, version 2.0, etc.), or simultaneously issued by either the same publisher/distributor or another publisher/distributor (e.g., large print edition, British edition, etc.).

<bibl> → model.biblPart → model.editionLike → <edition>

**<editor>** The name of the individual(s), institution(s) or organization(s) acting in an editorial capacity.

<bibl> → model.biblPart → model.respLike → model.respLikePart → <editor>

**<expan>** Contains the expansion of an abbreviation.

<bibl> → model.textPhraseLike → model.textPhraseLike.limited → model.editorialLike → <expan>

**<extent>** Used to express size in terms other than physical dimensions, such as number of pages, records, bytes, physical components, etc.

<bibl> → model.textPhraseLike → model.textPhraseLike.limited → <extent>

**<fig>** Groups elements representing or containing graphic information such as an illustration or figure.

<bibl> → model.textPhraseLike → model.textPhraseLike.limited → model.figureLike → <fig>

**<funder>** Names of individuals, institutions, or organizations responsible for funding. Funders provide financial support for a project; they are distinct from sponsors, who provide intellectual support and authority.

<bibl> → model.biblPart → model.respLike → model.respLikePart → <funder>

**<genre>** Term or terms that designate a category characterizing a particular style, form, or content.

<bibl> → model.biblPart → <genre>

**<geogFeat>** Contains a common noun identifying a geographical feature.

<bibl> → model.textPhraseLike → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <geogFeat>

**<geogName>** The proper noun designation for a place, natural feature, or political jurisdiction.

<bibl> → model.textPhraseLike → model.textPhraseLike.limited → model.nameLike → model.nameLike.place → model.nameLike.geogName → <geogName>

**<height>** Description of the vertical size of an object.

<bibl> → model.textPhraseLike → model.textPhraseLike.limited → model.dimLike → <height>

**<heraldry>** Contains a heraldic formula or phrase, typically found as part of a blazon, coat of arms, etc.

<bibl> → model.textPhraseLike → model.textPhraseLike.limited → model.mslinline → <heraldry>

**<identifier>** An alpha-numeric string that establishes the identity of the described material.

<bibl> → model.textPhraseLike → model.textPhraseLike.limited → model.identifierLike → <identifier>

**<imprint>** Information relating to the publication or distribution of a bibliographic item.

<bibl> → model.biblPart → <imprint>

**<lb>** An empty formatting element that forces text to begin on a new line.

<bibl> → model.textPhraseLike → model.textPhraseLike.limited → model.lbLike → <lb>

**<librettist>** Person or organization who is a writer of the text of an opera, oratorio, etc.

<bibl> → model.biblPart → model.respLike → model.respLikePart → <librettist>

**<locus>** Defines a location within a manuscript or manuscript component, usually as a (possibly discontinuous) sequence of folio references.

<bibl> → model.textPhraseLike → model.textPhraseLike.limited → model.mslinline → <locus>

**<locusGrp>** Groups locations which together form a distinct but discontinuous item within a manuscript or manuscript part, according to a specific foliation.

<bibl> → model.textPhraseLike → model.textPhraseLike.limited → model.mslinline → <locusGrp>

**<lyricist>** Person or organization who is a writer of the text of a song.

<bibl> → model.biblPart → model.respLike → model.respLikePart → <lyricist>

**<name>** Proper noun or noun phrase.

<bibl> → model.textPhraseLike → model.textPhraseLike.limited → model.nameLike → <name>

**<num>** Numeric information in any form.

<bibl> → model.textPhraseLike → model.textPhraseLike.limited → model.measurementLike → model.numLike → <num>

**<pb>** An empty formatting element that forces text to begin on a new page.

<bibl> → model.textPhraseLike → model.pbLike → <pb>

**<perfDuration>** Used to express the duration of performance of printed or manuscript music or the playing time for a sound recording, videorecording, etc.

<bibl> → model.biblPart → <perfDuration>

**<periodName>** A label that describes a period of time, such as 'Baroque' or '3rd Style period'.

<bibl> → model.textPhraseLike → model.textPhraseLike.limited → model.nameLike.label → <periodName>

**<persName>** Designation for an individual, including any or all of that individual's forenames, surnames, honorific titles, and added names.

<bibl> → model.textPhraseLike → model.textPhraseLike.limited → model.nameLike → model.nameLike.agent → <persName>

**<physLoc>** Groups information about the current physical location of a bibliographic item, such as the repository in which it is located and its shelf mark(s), and its previous locations.

<bibl> → model.biblPart → <physLoc>

**<postBox>** (postal box or post office box) contains a number or other identifier for some postal delivery point other than a street address.

<bibl> → model.textPhraseLike → model.textPhraseLike.limited → model.addressPart → <postBox>

**<postCode>** (postal code) contains a numerical or alphanumeric code used as part of a postal address to simplify sorting or delivery of mail.

<bibl> → model.textPhraseLike → model.textPhraseLike.limited → model.addressPart → <postCode>

**<ptr>** Defines a traversible pointer to another location, using only attributes to describe the destination.

<bibl> → model.textPhraseLike → model.textPhraseLike.limited → model.locrefLike → <ptr>

**<pubPlace>** Name of the place where a bibliographic item was published.

<bibl> → model.imprintPart → <pubPlace>

**<publisher>** Name of the organization responsible for the publication of a bibliographic item.

<bibl> → model.imprintPart → <publisher>

**<q>** Contains material which is distinguished from the surrounding phrase-level text using quotation marks or a similar method. Use <quote> for block-level quotations.

<bibl> → model.textPhraseLike → model.textPhraseLike.limited → model.qLike → <q>

**<recipient>** The name of the individual(s), institution(s) or organization(s) receiving correspondence.

<bibl> → model.biblPart → <recipient>

**<ref>** Defines a traversible reference to another location. May contain text and sub-elements that describe the destination.

<bibl> → model.textPhraseLike → model.textPhraseLike.limited → model.locrefLike → <ref>

**<region>** Contains the name of an administrative unit such as a state, province, or county, larger than a settlement, but smaller than a country.

<bibl> → model.textPhraseLike → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <region>

**<relatedItem>** Contains or references another bibliographic item which is related to the present one.

<bibl> → model.biblPart → <relatedItem>

**<relation>** Describes a relationship or linkage amongst entities.

<bibl> → model.textPhraseLike → model.textPhraseLike.limited → model.relationLike → <relation>

**<relationList>** Gathers relation elements.

<bibl> → model.textPhraseLike → model.textPhraseLike.limited → model.relationLike → <relationList>

**<rend>** A formatting element indicating special visual rendering, e.g., bold or italicized, of a text word or phrase.

<bibl> → model.textPhraseLike → model.textPhraseLike.limited → model.rendLike → <rend>

**<repository>** Institution, agency, or individual which holds a bibliographic item.

<bibl> → model.textPhraseLike → model.textPhraseLike.limited → model.nameLike → model.nameLike.place → model.repositoryLike → <repository>

**<respStmt>** Transcription of text that names one or more individuals, groups, or in rare cases, mechanical processes, responsible for creation, realization, production, funding, or distribution of the intellectual or artistic content.

<bibl> → model.biblPart → model.respLike → <respStmt>

**<secFolio>** Marks the word or words taken from a fixed point in a codex (typically the beginning of the second leaf) in order to provide a unique identifier for the item.

<bibl> → model.textPhraseLike → model.textPhraseLike.limited → model.mslinline → <secFolio>

**<seg>** (arbitrary segment) represents any segmentation of text below the "text component" level.

<bibl> → model.textPhraseLike → model.textPhraseLike.limited → <seg>

**<series>** Contains information about the serial publication in which a bibliographic item has appeared.

<bibl> → model.biblPart → <series>

**<settlement>** Contains the name of a settlement such as a city, town, or village identified as a single geopolitical or administrative unit.

<bibl> → model.textPhraseLike → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <settlement>

**<signatures>** Provides a description of the leaf or quire signatures found within a codex.

<bibl> → model.textPhraseLike → model.textPhraseLike.limited → model.mslinline → <signatures>

**<sponsor>** Names of sponsoring individuals, organizations or institutions. Sponsors give their intellectual authority to a project; they are to be distinguished from funders, who provide the funding but do not necessarily take intellectual responsibility.

<bibl> → model.biblPart → model.respLike → model.respLikePart → <sponsor>

**<stack>** An inline table with a single column.

<bibl> → model.textPhraseLike → model.textPhraseLike.limited → model.rendLike → <stack>

**<stamp>** Contains a word or phrase describing an official mark indicating ownership, genuineness, validity, etc.

<bibl> → model.textPhraseLike → model.textPhraseLike.limited → model.mslinline → <stamp>

**<street>** full street address including any name or number identifying a building as well as the name of the street or route on which it is located.

<bibl> → model.textPhraseLike → model.textPhraseLike.limited → model.addressPart → <street>

**<styleName>** A label for a characteristic style of writing or performance, such as 'bebop' or 'rock-n-roll'.

<bibl> → model.textPhraseLike → model.textPhraseLike.limited → model.nameLike.label → <styleName>

**<symbol>** A reference to a previously defined symbol.

<bibl> → model.textPhraseLike → model.textPhraseLike.limited → <symbol>

**<term>** Keyword or phrase which describes a resource.

<bibl> → model.textPhraseLike → model.textPhraseLike.limited → <term>

**<textLang>** Identifies the languages and writing systems within the work described by a bibliographic description, not the language of the description.

<bibl> → model.biblPart → <textLang>

**<title>** Title of a bibliographic entity.

<bibl> → model.textPhraseLike → model.textPhraseLike.limited → model.titleLike → <title>

**<unpub>** Used to explicitly indicate that a bibliographic resource is unpublished.

<bibl> → model.imprintPart → <unpub>

**<watermark>** Contains a description of a watermark or similar device.

<bibl> → model.textPhraseLike → model.textPhraseLike.limited → model.mslInLine → <watermark>

**<width>** Description of the horizontal size of an object.

<bibl> → model.textPhraseLike → model.textPhraseLike.limited → model.dimLike → <width>

## Remarks

<bibl> may contain a mix of text and more specific elements such as <title>, <edition>, <persName>, and <corpName>. This element may also function as a hypertext reference to an external electronic resource. Do not confuse this element with <ref>, which does not provide special bibliographic sub-elements.

The model of this element is based on the **bibl** element of the Text Encoding Initiative (TEI) and the **bibref** element of the Encoded Archival Description (EAD).

## <biblList>

List of bibliographic references.

### Referenced in chapters

[3.6 Work Description](#), [3.6.10 Bibliographic Evidence](#), [3.7 Encoding Sources in MEI](#)

### Module

[MEI.shared](#)

### Attributes

**@analog** (*optional*) Contains a reference to a field or element in another descriptive encoding system to which this MEI element is comparable. Value is plain text.

<biblList> → [att.bibl](#) → @analog

**@class** (*optional*) Contains one or more URIs which denote classification terms that apply to the entity bearing this attribute. One or more values from [data.URI](#), separated by spaces.

<biblList> → [att.common](#) → [att.typed](#) → [att.classed](#) → @class

**@copyof** (*optional*) Points to an element of which the current element is a copy. Value conforms to [data.URI](#).

<biblList> → [att.common](#) → [att.linked](#) → @copyof

**@corresp** (*optional*) Used to point to other elements that correspond to this one in a generic fashion. One or more values from [data.URI](#), separated by spaces.

<biblList> → [att.common](#) → [att.linked](#) → @corresp

**@facs** (*optional*) Points to one or more images, portions of an image, or surfaces which correspond to the current element. One or more values from [data.URI](#), separated by spaces.

<biblList> → [att.facsimile](#) → @facs

**@follows** (*optional*) points to one or more events in a user-defined collection that are known to be predecessors of the current element. One or more values from [data.URI](#), separated by spaces.

<biblList> → [att.common](#) → [att.linked](#) → @follows

**@label** (*optional*) Captures text to be used to generate a label for the element to which it's attached, a "tool tip" or prefatory text, for example. Should not be used to record document content. Value is plain text.

<biblList> → [att.common](#) → [att.labelled](#) → @label

**@n** (*optional*) Provides a number-like designation that indicates an element's position in a sequence of similar elements. May not contain space characters. Value conforms to [data.WORD](#).

<biblList> → [att.common](#) → [att.nNumberLike](#) → @n

**@next** (*optional*) Used to point to the next event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<biblList> → [att.common](#) → [att.linked](#) → @next

**@precedes** (*optional*) Points to one or more events in a user-defined collection that are known to be successors of the current element. One or more values from [data.URI](#), separated by spaces.

<biblList> → [att.common](#) → [att.linked](#) → @precedes

**@prev** (*optional*) Points to the previous event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<biblList> → [att.common](#) → [att.linking](#) → @prev

**@resp** (*optional*) Indicates the agent(s) responsible for some aspect of the text's transcription, editing, or encoding. Its value must point to one or more identifiers declared in the document header. One or more values from [data.URI](#), separated by spaces.

<biblList> → [att.common](#) → [att.responsibility](#) → @resp

**@sameas** (*optional*) Points to an element that is the same as the current element but is not a literal copy of the current element. One or more values from [data.URI](#), separated by spaces.

<biblList> → [att.common](#) → [att.linking](#) → @sameas

**@synch** (*optional*) Points to elements that are synchronous with the current element. One or more values from [data.URI](#), separated by spaces.

<biblList> → [att.common](#) → [att.linking](#) → @synch

**@translit** (*optional*) Specifies the transliteration technique used. Value is a [NMTOKEN](#).

<biblList> → [att.lang](#) → @translit

**@type** (*optional*) Designation which characterizes the element in some sense, using any convenient classification scheme or typology that employs single-token labels. One or more values of datatype [NMTOKEN](#), separated by spaces.

<biblList> → [att.common](#) → [att.typed](#) → @type

**@xml:base** (*optional*) Provides a base URI reference with which applications can resolve relative URI references into absolute URI references. Value conforms to [data.URI](#).

<biblList> → [att.common](#) → [att.basic](#) → @xml:base

**@xml:id** (*optional*) Regularizes the naming of an element and thus facilitates building links between it and other resources. Each id attribute within a document must have a unique value. Value is a valid [xml:id](#).

<biblList> → [att.common](#) → [att.basic](#) → [att.id](#) → @xml:id

**@xml:lang** (*optional*) Identifies the language of the element's content. The values for this attribute are language 'tags' as defined in BCP 47. All language tags that make use of private use sub-tags must be documented in a corresponding language element in the MEI header whose id attribute is the same as the language tag's value. Value is a [language](#).

<biblList> → [att.lang](#) → @xml:lang

## Member of

[model.listLike](#) Groups list-like elements.

## Contained By

**<abbr>** A generic element for 1) a shortened form of a word, including an acronym or 2) a shorthand notation.

<biblList> → [model.listLike](#) → [model.textComponentLike](#) → [model.editTransPart.text](#) → [model.editTransPart](#) → <abbr>

**<add>** Marks an addition to the text.

<biblList> → [model.listLike](#) → [model.textComponentLike](#) → [model.editTransPart.text](#) → [model.editTransPart](#) → <add>

**<annot>** Provides a statement explaining the text or indicating the basis for an assertion.

<biblList> → [model.listLike](#) → [model.textComponentLike](#) → <annot>

**<argument>** Contains a formal list or prose description of topics addressed.

<biblList> → model.listLike → model.textComponentLike → <argument>

**<biblList>** List of bibliographic references.

<biblList> → elements having biblList as direct children → <biblList>

**<corr>** Contains the correct form of an apparent erroneous passage.

<biblList> → model.listLike → model.textComponentLike → model.editTransPart.text → model.editTransPart → <corr>

**<damage>** Contains an area of damage to the physical medium.

<biblList> → model.listLike → model.textComponentLike → model.editTransPart.text → model.editTransPart → <damage>

**<dedication>** Contains a dedicatory statement.

<biblList> → model.listLike → model.textComponentLike → <dedication>

**<del>** Contains information deleted, marked as deleted, or otherwise indicated as superfluous or spurious in the copy text by an author, scribe, annotator, or corrector.

<biblList> → model.listLike → model.textComponentLike → model.editTransPart.text → model.editTransPart → <del>

**<div>** Major structural division of text, such as a preface, chapter or section.

<biblList> → model.listLike → model.textComponentLike → <div>

**<epigraph>** Contains a quotation, anonymous or attributed, appearing on a title page.

<biblList> → model.listLike → model.paracontentPart → <epigraph>

**<event>** Contains a free-text event description.

<biblList> → elements having biblList as direct children → <event>

**<eventList>** Contains historical information given as a sequence of significant past events.

<biblList> → elements having biblList as direct children → <eventList>

**<expan>** Contains the expansion of an abbreviation.

<biblList> → model.listLike → model.textComponentLike → model.editTransPart.text → model.editTransPart → <expan>

**<expression>** Intellectual or artistic realization of a work.

<biblList> → elements having biblList as direct children → <expression>

**<figDesc>** Contains a brief prose description of the appearance or content of a graphic figure, for use when documenting an image without displaying it.

<biblList> → model.listLike → model.textComponentLike → <figDesc>

**<history>** Provides a container for information about the history of a resource other than the circumstances of its creation.

<biblList> → model.listLike → model.textComponentLike → <history>

**<imprimatur>** Contains a formal statement authorizing the publication of a work, sometimes required to appear on a title page or its verso.

<biblList> → model.listLike → model.paracontentPart → <imprimatur>

**<lem>** (lemma) – Contains the lemma, or base text, of a textual variation.

<biblList> → model.listLike → model.textComponentLike → model.rdgPart.text → model.rdgPart → <lem>

**<li>** Single item in a <list>.

<biblList> → model.listLike → model.textComponentLike → <li>

**<manifestation>** A bibliographic description of a physical embodiment of an expression of a work.

<biblList> → elements having biblList as direct children → <manifestation>

**<orig>** Contains material which is marked as following the original, rather than being normalized or corrected.

<biblList> → model.listLike → model.textComponentLike → model.editTransPart.text → model.editTransPart → <orig>

**<p>** One or more text phrases that form a logical prose passage.

<biblList> → model.listLike → model.paracontentPart → <p>

**<pgDesc>** Contains a brief prose description of the appearance or description of the content of a physical page.

<biblList> → model.listLike → model.textComponentLike → <pgDesc>

**<pgFoot>** A running footer.

<biblList> → model.listLike → model.textComponentLike → <pgFoot>

**<pgHead>** A running header.

<biblList> → model.listLike → model.textComponentLike → <pgHead>

**<quote>** Contains a paragraph-like block of text attributed to an external source, normally set off from the surrounding text by spacing or other typographic distinction.

<biblList> → model.listLike → model.paracontentPart → <quote>

**<rdg>** (reading) – Contains a single reading within a textual variation.

<biblList> → model.listLike → model.textComponentLike → model.rdgPart.text → model.rdgPart → <rdg>

**<reg>** Contains material which has been regularized or normalized in some sense.

<biblList> → model.listLike → model.textComponentLike → model.editTransPart.text → model.editTransPart → <reg>

**<restore>** Indicates restoration of material to an earlier state by cancellation of an editorial or authorial marking or instruction.

<biblList> → model.listLike → model.textComponentLike → model.editTransPart.text → model.editTransPart → <restore>

**<sic>** Contains apparently incorrect or inaccurate material.

<biblList> → model.listLike → model.textComponentLike → model.editTransPart.text → model.editTransPart → <sic>

**<supplied>** Contains material supplied by the transcriber or editor for any reason.

<biblList> → model.listLike → model.textComponentLike → model.editTransPart.text → model.editTransPart → <supplied>

**<td>** Designates a table cell that contains data as opposed to a cell that contains column or row heading information.

<biblList> → model.listLike → model.textComponentLike → <td>

**<th>** Designates a table cell containing column or row heading information as opposed to one containing data.

<biblList> → model.listLike → model.textComponentLike → <th>

**<titlePage>** Contains a transcription of the title page of a text.

<biblList> → model.listLike → model.textComponentLike → <titlePage>

**<unclear>** Contains material that cannot be transcribed with certainty because it is illegible or inaudible in the source.

<biblList> → model.listLike → model.textComponentLike → model.editTransPart.text → model.editTransPart → <unclear>

**<work>** Provides a detailed description of a work — a distinct intellectual or artistic creation — specifically its history, language use, and high-level musical attributes (e.g., key, tempo, meter, medium of performance, and intended duration).

<biblList> → elements having biblList as direct children → <work>

## May Contain

**<bibl>** Provides a loosely-structured bibliographic citation in which the sub-components may or may not be explicitly marked.

<biblList> → [model.biblLike](#) → <bibl>

**<biblList>** List of bibliographic references.

<biblList> → direct children → <biblList>

**<biblStruct>** Contains a bibliographic citation in which bibliographic sub-elements must appear in a specified order.

<biblList> → [model.biblLike](#) → <biblStruct>

**<head>** Contains any heading, for example, the title of a section of text, or the heading of a list.

<biblList> → [model.headLike](#) → <head>

**<label>** A container for document text that identifies the feature to which it is attached. For a "tool tip" or other generated label, use the label attribute.

<biblList> → direct children → <label>

## Remarks

The model of this element is based on the [listBibl](#) element of the Text Encoding Initiative (TEI).

## Constraints

When labels are used, usually each bibliographic item has one.

## <biblScope>

(scope of citation) – Defines the scope of a bibliographic reference, for example as a list of page numbers, or a named subdivision of a larger work.

### Referenced in chapters

#### 9.2.12 Bibliographic Citations and References

### Module

MEI.shared

### Attributes

**@analog** (*optional*) Contains a reference to a field or element in another descriptive encoding system to which this MEI element is comparable. Value is plain text.

<biblScope> → att.bibl → @analog

**@atleast** (*optional*) Gives a minimum estimated value for an approximate measurement. Value is a decimal number.

<biblScope> → att.extent → att.ranging → @atleast

**@atmost** (*optional*) Gives a maximum estimated value for an approximate measurement. Value is a decimal number.

<biblScope> → att.extent → att.ranging → @atmost

**@class** (*optional*) Contains one or more URIs which denote classification terms that apply to the entity bearing this attribute. One or more values from [data.URI](#), separated by spaces.

<biblScope> → att.common → att.typed → att.classed → @class

**@confidence** (*optional*) Specifies the degree of statistical confidence (between zero and one) that a value falls within the range specified by min and max, or the proportion of observed values that fall within that range. Value conforms to [data.CONFIDENCE](#).

<biblScope> → att.extent → att.ranging → @confidence

**@copyof** (*optional*) Points to an element of which the current element is a copy. Value conforms to [data.URI](#).

<biblScope> → att.common → att.linkin → @copyof

**@corresp** (*optional*) Used to point to other elements that correspond to this one in a generic fashion. One or more values from [data.URI](#), separated by spaces.

<biblScope> → att.common → att.linkin → @corresp

**@extent** (*optional*) Captures a measurement, count, or description. When extent contains a numeric value, use the unit attribute to indicate the measurement unit. Value is plain text.

<biblScope> → att.extent → @extent

**@facs** (*optional*) Points to one or more images, portions of an image, or surfaces which correspond to the current element. One or more values from [data.URI](#), separated by spaces.

<biblScope> → att.facsimile → @facs

**@follows** (*optional*) points to one or more events in a user-defined collection that are known to be predecessors of the current element. One or more values from [data.URI](#), separated by spaces.

<biblScope> → att.common → att.linkin → @follows

**@from** (*optional*) Value is a [token](#).

<biblScope> → direct children → @from

**@label** (*optional*) Captures text to be used to generate a label for the element to which it's attached, a "tool tip" or prefatory text, for example. Should not be used to record document content. Value is plain text.

<biblScope> → [att.common](#) → [att.labelled](#) → @label

**@max** (*optional*) Where the measurement summarizes more than one observation or a range of values, supplies the maximum value observed. Value is a decimal number.

<biblScope> → [att.extent](#) → [att.ranging](#) → @max

**@min** (*optional*) Where the measurement summarizes more than one observation or a range of values, supplies the minimum value observed. Value is a decimal number.

<biblScope> → [att.extent](#) → [att.ranging](#) → @min

**@n** (*optional*) Provides a number-like designation that indicates an element's position in a sequence of similar elements. May not contain space characters. Value conforms to [data.WORD](#).

<biblScope> → [att.common](#) → [att.nNumberLike](#) → @n

**@next** (*optional*) Used to point to the next event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<biblScope> → [att.common](#) → [att.linked](#) → @next

**@precedes** (*optional*) Points to one or more events in a user-defined collection that are known to be successors of the current element. One or more values from [data.URI](#), separated by spaces.

<biblScope> → [att.common](#) → [att.linked](#) → @precedes

**@prev** (*optional*) Points to the previous event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<biblScope> → [att.common](#) → [att.linked](#) → @prev

**@resp** (*optional*) Indicates the agent(s) responsible for some aspect of the text's transcription, editing, or encoding. Its value must point to one or more identifiers declared in the document header. One or more values from [data.URI](#), separated by spaces.

<biblScope> → [att.common](#) → [att.responsibility](#) → @resp

**@sameas** (*optional*) Points to an element that is the same as the current element but is not a literal copy of the current element. One or more values from [data.URI](#), separated by spaces.

<biblScope> → [att.common](#) → [att.linked](#) → @sameas

**@synch** (*optional*) Points to elements that are synchronous with the current element. One or more values from [data.URI](#), separated by spaces.

<biblScope> → [att.common](#) → [att.linked](#) → @synch

**@to** (*optional*) Value is a [token](#).

<biblScope> → direct children → @to

**@translit** (*optional*) Specifies the transliteration technique used. Value is a [NMTOKEN](#).

<biblScope> → [att.lang](#) → @translit

**@type** (*optional*) Designation which characterizes the element in some sense, using any convenient classification scheme or typology that employs single-token labels. One or more values of datatype [NMTOKEN](#), separated by spaces.

<biblScope> → [att.common](#) → [att.typed](#) → @type

**@unit** (*optional*) Indicates the unit of measurement. Allowed values are: "byte" (Byte.), "char" (Character.), "cm" (Centimeter.), "deg" (Degree.), "in" (Inch.), "issue" (Serial issue.), "ft" (Foot.), "m" (Meter.), "mm" (Millimeter.), "page" (Page.), "pc" (Pica.), "pt" (Point.), "px" (Pixel.), "rad" (Radian.), "record" (Record.), "vol" (Serial volume.), "vu" (MEI virtual unit.)

<biblScope> → att.extent → att.measurement → @unit

**@xml:base** (*optional*) Provides a base URI reference with which applications can resolve relative URI references into absolute URI references. Value conforms to [data.URI](#).

<biblScope> → att.common → att.basic → @xml:base

**@xml:id** (*optional*) Regularizes the naming of an element and thus facilitates building links between it and other resources. Each id attribute within a document must have a unique value. Value is a valid [xml:id](#).

<biblScope> → att.common → att.basic → att.id → @xml:id

**@xml:lang** (*optional*) Identifies the language of the element's content. The values for this attribute are language 'tags' as defined in BCP 47. All language tags that make use of private use sub-tags must be documented in a corresponding language element in the MEI header whose id attribute is the same as the language tag's value. Value is a [language](#).

<biblScope> → att.lang → @xml:lang

## Member of

[model.biblPart](#) Groups elements that may appear as part of a bibliographic description.

## Contained By

**<analytic>** Contains bibliographic elements describing an item (e.g., an article or poem) published within a monograph or journal and not as an independent publication.

<biblScope> → elements having biblScope as direct children → <analytic>

**<bibl>** Provides a loosely-structured bibliographic citation in which the sub-components may or may not be explicitly marked.

<biblScope> → [model.biblPart](#) → <bibl>

**<monogr>** Contains bibliographic elements describing an item, for example, a published book or journal, score, recording, or an unpublished manuscript.

<biblScope> → elements having biblScope as direct children → <monogr>

**<seriesStmt>** Groups information about the series, if any, to which a publication belongs.

<biblScope> → elements having biblScope as direct children → <seriesStmt>

## May Contain

**<abbr>** A generic element for 1) a shortened form of a word, including an acronym or 2) a shorthand notation.

<biblScope> → [model.textPhraseLike.limited](#) → [model.editorialLike](#) → <abbr>

**<address>** Contains a postal address, for example of a publisher, an organization, or an individual.

<biblScope> → [model.textPhraseLike.limited](#) → [model.addressLike](#) → <address>

**<annot>** Provides a statement explaining the text or indicating the basis for an assertion.

<biblScope> → [model.textPhraseLike.limited](#) → [model.annotLike](#) → <annot>

**<bibl>** Provides a loosely-structured bibliographic citation in which the sub-components may or may not be explicitly marked.

<biblScope> → model.textPhraseLike.limited → model.biblLike → <bibl>

**<biblStruct>** Contains a bibliographic citation in which bibliographic sub-elements must appear in a specified order.

<biblScope> → model.textPhraseLike.limited → model.biblLike → <biblStruct>

**<bloc>** Contains the name of a geopolitical unit consisting of two or more nation states or countries.

<biblScope> → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <bloc>

**<catchwords>** Describes the system used to ensure correct ordering of the quires making up an item, typically by means of annotations at the foot of the page.

<biblScope> → model.textPhraseLike.limited → model.mslnline → <catchwords>

**<corpName>** Identifies an organization or group of people that acts as a single entity.

<biblScope> → model.textPhraseLike.limited → model.nameLike → model.nameLike.agent → <corpName>

**<country>** Contains the name of a geopolitical unit, such as a nation, country, colony, or commonwealth, larger than or administratively superior to a region and smaller than a bloc.

<biblScope> → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <country>

**<date>** A string identifying a point in time or the time period between two such points.

<biblScope> → model.textPhraseLike.limited → model.dateLike → <date>

**<dedicatee>** Entity to whom a creative work is formally offered.

<biblScope> → model.textPhraseLike.limited → <dedicatee>

**<depth>** Description of a measurement taken through a three-dimensional object.

<biblScope> → model.textPhraseLike.limited → model.dimLike → <depth>

**<dim>** Any single dimensional specification.

<biblScope> → model.textPhraseLike.limited → model.dimLike → <dim>

**<dimensions>** Information about the physical size of an entity; usually includes numerical data.

<biblScope> → model.textPhraseLike.limited → <dimensions>

**<district>** Contains the name of any kind of subdivision of a settlement, such as a parish, ward, or other administrative or geographic unit.

<biblScope> → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <district>

**<expan>** Contains the expansion of an abbreviation.

<biblScope> → model.textPhraseLike.limited → model.editorialLike → <expan>

**<extent>** Used to express size in terms other than physical dimensions, such as number of pages, records, bytes, physical components, etc.

<biblScope> → model.textPhraseLike.limited → <extent>

**<fig>** Groups elements representing or containing graphic information such as an illustration or figure.

<biblScope> → model.textPhraseLike.limited → model.figureLike → <fig>

**<geogFeat>** Contains a common noun identifying a geographical feature.

<biblScope> → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <geogFeat>

**<geogName>** The proper noun designation for a place, natural feature, or political jurisdiction.

<biblScope> → model.textPhraseLike.limited → model.nameLike → model.nameLike.place → model.nameLike.geogName → <geogName>

**<height>** Description of the vertical size of an object.

<biblScope> → model.textPhraseLike.limited → model.dimLike → <height>

**<heraldry>** Contains a heraldic formula or phrase, typically found as part of a blazon, coat of arms, etc.

<biblScope> → model.textPhraseLike.limited → model.msInline → <heraldry>

**<identifier>** An alpha-numeric string that establishes the identity of the described material.

<biblScope> → model.textPhraseLike.limited → model.identifierLike → <identifier>

**<lb>** An empty formatting element that forces text to begin on a new line.

<biblScope> → model.textPhraseLike.limited → model.lbLike → <lb>

**<locus>** Defines a location within a manuscript or manuscript component, usually as a (possibly discontinuous) sequence of folio references.

<biblScope> → model.textPhraseLike.limited → model.msInline → <locus>

**<locusGrp>** Groups locations which together form a distinct but discontinuous item within a manuscript or manuscript part, according to a specific foliation.

<biblScope> → model.textPhraseLike.limited → model.msInline → <locusGrp>

**<name>** Proper noun or noun phrase.

<biblScope> → model.textPhraseLike.limited → model.nameLike → <name>

**<num>** Numeric information in any form.

<biblScope> → model.textPhraseLike.limited → model.measurementLike → model.numLike → <num>

**<periodName>** A label that describes a period of time, such as 'Baroque' or '3rd Style period'.

<biblScope> → model.textPhraseLike.limited → model.nameLike.label → <periodName>

**<persName>** Designation for an individual, including any or all of that individual's forenames, surnames, honorific titles, and added names.

<biblScope> → model.textPhraseLike.limited → model.nameLike → model.nameLike.agent → <persName>

**<postBox>** (postal box or post office box) contains a number or other identifier for some postal delivery point other than a street address.

<biblScope> → model.textPhraseLike.limited → model.addressPart → <postBox>

**<postCode>** (postal code) contains a numerical or alphanumeric code used as part of a postal address to simplify sorting or delivery of mail.

<biblScope> → model.textPhraseLike.limited → model.addressPart → <postCode>

**<ptr>** Defines a traversible pointer to another location, using only attributes to describe the destination.

<biblScope> → model.textPhraseLike.limited → model.locrefLike → <ptr>

**<q>** Contains material which is distinguished from the surrounding phrase-level text using quotation marks or a similar method. Use <quote> for block-level quotations.

<biblScope> → model.textPhraseLike.limited → model.qLike → <q>

**<ref>** Defines a traversible reference to another location. May contain text and sub-elements that describe the destination.

<biblScope> → model.textPhraseLike.limited → model.locrefLike → <ref>

**<region>** Contains the name of an administrative unit such as a state, province, or county, larger than a settlement, but smaller than a country.

<biblScope> → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <region>

**<relation>** Describes a relationship or linkage amongst entities.

<biblScope> → model.textPhraseLike.limited → model.relationLike → <relation>

**<relationList>** Gathers relation elements.

<biblScope> → model.textPhraseLike.limited → model.relationLike → <relationList>

**<rend>** A formatting element indicating special visual rendering, e.g., bold or italicized, of a text word or phrase.

<biblScope> → model.textPhraseLike.limited → model.rendLike → <rend>

**<repository>** Institution, agency, or individual which holds a bibliographic item.

<biblScope> → model.textPhraseLike.limited → model.nameLike → model.nameLike.place → model.repositoryLike → <repository>

**<secFolio>** Marks the word or words taken from a fixed point in a codex (typically the beginning of the second leaf) in order to provide a unique identifier for the item.

<biblScope> → model.textPhraseLike.limited → model.msInline → <secFolio>

**<seg>** (arbitrary segment) represents any segmentation of text below the "text component" level.

<biblScope> → model.textPhraseLike.limited → <seg>

**<settlement>** Contains the name of a settlement such as a city, town, or village identified as a single geopolitical or administrative unit.

<biblScope> → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <settlement>

**<signatures>** Provides a description of the leaf or quire signatures found within a codex.

<biblScope> → model.textPhraseLike.limited → model.msInline → <signatures>

**<stack>** An inline table with a single column.

<biblScope> → model.textPhraseLike.limited → model.rendLike → <stack>

**<stamp>** Contains a word or phrase describing an official mark indicating ownership, genuineness, validity, etc.

<biblScope> → model.textPhraseLike.limited → model.msInline → <stamp>

**<street>** full street address including any name or number identifying a building as well as the name of the street or route on which it is located.

<biblScope> → model.textPhraseLike.limited → model.addressPart → <street>

**<styleName>** A label for a characteristic style of writing or performance, such as 'bebop' or 'rock-n-roll'.

<biblScope> → model.textPhraseLike.limited → model.nameLike.label → <styleName>

**<symbol>** A reference to a previously defined symbol.

<biblScope> → model.textPhraseLike.limited → <symbol>

**<term>** Keyword or phrase which describes a resource.

<biblScope> → model.textPhraseLike.limited → <term>

**<title>** Title of a bibliographic entity.

<biblScope> → model.textPhraseLike.limited → model.titleLike → <title>

**<watermark>** Contains a description of a watermark or similar device.

<biblScope> → model.textPhraseLike.limited → model.msInline → <watermark>

**<width>** Description of the horizontal size of an object.

<biblScope> → model.textPhraseLike.limited → model.dimLike → <width>

## Remarks

Use the from and to attributes to regularize the beginning and ending values provided in the element content.

The model of this element is based on the [biblScope](#) element of the Text Encoding Initiative (TEI).

## <biblStruct>

(structured bibliographic citation) – Contains a bibliographic citation in which bibliographic sub-elements must appear in a specified order.

### Referenced in chapters

[3.4.1.6 Source Description](#)

### Module

[MEI.shared](#)

### Attributes

**@analog** (*optional*) Contains a reference to a field or element in another descriptive encoding system to which this MEI element is comparable. Value is plain text.

<biblStruct> → [att.bibl](#) → @analog

**@class** (*optional*) Contains one or more URIs which denote classification terms that apply to the entity bearing this attribute. One or more values from [data.URI](#), separated by spaces.

<biblStruct> → [att.common](#) → [att.typed](#) → [att.classed](#) → @class

**@copyof** (*optional*) Points to an element of which the current element is a copy. Value conforms to [data.URI](#).

<biblStruct> → [att.common](#) → [att.linking](#) → @copyof

**@corresp** (*optional*) Used to point to other elements that correspond to this one in a generic fashion. One or more values from [data.URI](#), separated by spaces.

<biblStruct> → [att.common](#) → [att.linking](#) → @corresp

**@data** (*optional*) Used to link metadata elements to one or more data-containing elements. One or more values from [data.URI](#), separated by spaces.

<biblStruct> → [att.dataPointing](#) → @data

**@evaluate** (*optional*) Specifies the intended meaning when a participant in a relationship is itself a pointer. Allowed values are: "**all**" (*If an element pointed to is itself a pointer, then the target of that pointer will be taken, and so on, until an element is found which is not a pointer.*), "**one**" (*If an element pointed to is itself a pointer, then its target (whether a pointer or not) is taken as the target of this pointer.*), "**none**" (*No further evaluation of targets is carried out beyond that needed to find the element(s) specified in plist or target attribute.*)

<biblStruct> → [att.targetEval](#) → @evaluate

**@follows** (*optional*) points to one or more events in a user-defined collection that are known to be predecessors of the current element. One or more values from [data.URI](#), separated by spaces.

<biblStruct> → [att.common](#) → [att.linking](#) → @follows

**@label** (*optional*) Captures text to be used to generate a label for the element to which it's attached, a "tool tip" or prefatory text, for example. Should not be used to record document content. Value is plain text.

<biblStruct> → [att.common](#) → [att.labelled](#) → @label

**@n** (*optional*) Provides a number-like designation that indicates an element's position in a sequence of similar elements. May not contain space characters. Value conforms to [data.WORD](#).

<biblStruct> → [att.common](#) → [att.nNumberLike](#) → @n

**@next** (*optional*) Used to point to the next event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<biblStruct> → att.common → att.linkin → @next

**@precedes** (*optional*) Points to one or more events in a user-defined collection that are known to be successors of the current element. One or more values from [data.URI](#), separated by spaces.

<biblStruct> → att.common → att.linkin → @precedes

**@prev** (*optional*) Points to the previous event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<biblStruct> → att.common → att.linkin → @prev

**@recordtype** Allowed values are: "a" (*Language material.*), "c" (*Notated music.*), "d" (*Manuscript notated music.*), "e" (*Non-manuscript cartographic material.*), "f" (*Manuscript cartographic material.*), "g" (*Projected medium.*), "i" (*Nonmusical sound recording.*), "j" (*Musical sound recording.*), "k" (*Two-dimensional nonprojectable graphic.*), "m" (*Computer file.*), "o" (*Kit.*), "p" (*Mixed materials.*), "r" (*Three-dimensional artifact or naturally occurring object.*), "t" (*Manuscript language material.*.)

<biblStruct> → att.recordType → @recordtype

**@resp** (*optional*) Indicates the agent(s) responsible for some aspect of the text's transcription, editing, or encoding. Its value must point to one or more identifiers declared in the document header. One or more values from [data.URI](#), separated by spaces.

<biblStruct> → att.common → att.responsibility → @resp

**@sameas** (*optional*) Points to an element that is the same as the current element but is not a literal copy of the current element. One or more values from [data.URI](#), separated by spaces.

<biblStruct> → att.common → att.linkin → @sameas

**@synch** (*optional*) Points to elements that are synchronous with the current element. One or more values from [data.URI](#), separated by spaces.

<biblStruct> → att.common → att.linkin → @synch

**@target** (*optional*) Identifies passive participants in a relationship; that is, the entities pointed "to". One or more values from [data.URI](#), separated by spaces.

<biblStruct> → att.pointing → @target

**@targettype** (*optional*) Characterization of target resource(s) using any convenient classification scheme or typology. Value is a [NMOKEN](#).

<biblStruct> → att.pointing → @targettype

**@translit** (*optional*) Specifies the transliteration technique used. Value is a [NMOKEN](#).

<biblStruct> → att.lang → @translit

**@type** (*optional*) Designation which characterizes the element in some sense, using any convenient classification scheme or typology that employs single-token labels. One or more values of datatype [NMOKEN](#), separated by spaces.

<biblStruct> → att.common → att.typed → @type

**@xlink:actuate** (*optional*) Defines whether a link occurs automatically or must be requested by the user. Allowed values are: "onLoad" (*Load the target resource(s) immediately.*), "onRequest" (*Load the target resource(s) upon user request.*), "none" (*Do not permit loading of the target resource(s).*), "other" (*Behavior other than allowed by the other values of this attribute.*)

<biblStruct> → att.pointing → @xlink:actuate

**@xlink:role** (*optional*) Characterization of the relationship between resources. The value of the role attribute must be a URI. Value conforms to [data.URI](#).

<biblStruct> → [att.pointing](#) → @xlink:role

**@xlink:show** (*optional*) Defines how a remote resource is rendered. Allowed values are: "**new**" (*Open in a new window.*), "**replace**" (*Load the referenced resource in the same window.*), "**embed**" (*Embed the referenced resource at the point of the link.*), "**none**" (*Do not permit traversal to the referenced resource.*), "**other**" (*Behavior other than permitted by the other values of this attribute.*)

<biblStruct> → [att.pointing](#) → @xlink:show

**@xml:base** (*optional*) Provides a base URI reference with which applications can resolve relative URI references into absolute URI references. Value conforms to [data.URI](#).

<biblStruct> → [att.common](#) → [att.basic](#) → @xml:base

**@xml:id** (*optional*) Regularizes the naming of an element and thus facilitates building links between it and other resources. Each id attribute within a document must have a unique value. Value is a valid [xml:id](#).

<biblStruct> → [att.common](#) → [att.basic](#) → [att.id](#) → @xml:id

**@xml:lang** (*optional*) Identifies the language of the element's content. The values for this attribute are language 'tags' as defined in BCP 47. All language tags that make use of private use sub-tags must be documented in a corresponding language element in the MEI header whose id attribute is the same as the language tag's value. Value is a [language](#).

<biblStruct> → [att.lang](#) → @xml:lang

## Member of

[model.biblLike](#) Groups elements containing a bibliographic description.

## Contained By

**<abbr>** A generic element for 1) a shortened form of a word, including an acronym or 2) a shorthand notation.

<biblStruct> → [model.biblLike](#) → [model.textPhraseLike.limited](#) → [model.editTransPart.text](#) → [model.editTransPart](#) → <abbr>

**<acquisition>** Records information concerning the process by which an item was acquired by the holding institution.

<biblStruct> → [model.biblLike](#) → [model.textPhraseLike.limited](#) → <acquisition>

**<actor>** Name of an actor appearing within a cast list.

<biblStruct> → [model.biblLike](#) → [model.textPhraseLike.limited](#) → <actor>

**<add>** Marks an addition to the text.

<biblStruct> → [model.biblLike](#) → [model.textPhraseLike.limited](#) → [model.editTransPart.text](#) → [model.editTransPart](#) → <add>

**<addName>** Contains an additional name component, such as a nickname, epithet, or alias, or any other descriptive phrase used within a personal name.

<biblStruct> → [model.biblLike](#) → [model.textPhraseLike.limited](#) → [model.textPhraseLike](#) → <addName>

**<addrLine>** Single line of a postal address.

<biblStruct> → [model.biblLike](#) → [model.textPhraseLike.limited](#) → [model.textPhraseLike](#) → <addrLine>

**<anchoredText>** Container for text that is fixed to a particular page location, regardless of changes made to the layout of the measures around it.

<biblStruct> → [model.biblLike](#) → [model.textPhraseLike.limited](#) → <anchoredText>

**<annot>** Provides a statement explaining the text or indicating the basis for an assertion.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → model.textPhraseLike → <annot>

**<arranger>** A person or organization who transcribes a musical composition, usually for a different medium from that of the original; in an arrangement the musical substance remains essentially unchanged.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → <arranger>

**<attacca>** An instruction to begin the next section or movement of a composition without pause.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → <attacca>

**<author>** The name of the creator of the intellectual content of a non-musical, literary work.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → <author>

**<bibl>** Provides a loosely-structured bibliographic citation in which the sub-components may or may not be explicitly marked.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → model.textPhraseLike → <bibl>

**<biblList>** List of bibliographic references.

<biblStruct> → model.biblLike → <biblList>

**<biblScope>** Defines the scope of a bibliographic reference, for example as a list of page numbers, or a named subdivision of a larger work.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → <biblScope>

**<bindingDesc>** Describes the present and former bindings of an item.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → <bindingDesc>

**<bloc>** Contains the name of a geopolitical unit consisting of two or more nation states or countries.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → model.textPhraseLike → <bloc>

**<bracketSpan>** Marks a sequence of notational events grouped by a bracket.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → <bracketSpan>

**<byline>** Contains the primary statement of responsibility given for a work on its title page.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → <byline>

**<caption>** A label which accompanies an illustration or a table.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → model.textPhraseLike → <caption>

**<composer>** The name of the creator of the intellectual content of a musical work.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → <composer>

**<contentItem>** Contains a single entry within a content description element.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → model.textPhraseLike → <contentItem>

**<contributor>** Names of individuals, institutions, or organizations responsible for contributions to the intellectual content of a work, where the specialized elements for authors, editors, etc. do not suffice or do not apply.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → <contributor>

**<corpName>** Identifies an organization or group of people that acts as a single entity.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → model.textPhraseLike → <corpName>

**<corr>** Contains the correct form of an apparent erroneous passage.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → model.editTransPart.text → model.editTransPart → <corr>

**<country>** Contains the name of a geopolitical unit, such as a nation, country, colony, or commonwealth, larger than or administratively superior to a region and smaller than a bloc.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → model.textPhraseLike → <country>

**<cpMark>** A verbal or graphical indication to copy musical material written elsewhere.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → <cpMark>

**<creation>** Non-bibliographic details of the creation of an intellectual entity, in narrative form, such as the date, place, and circumstances of its composition. More detailed information may be captured within the history element.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → <creation>

**<damage>** Contains an area of damage to the physical medium.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → model.editTransPart.text → model.editTransPart → <damage>

**<date>** A string identifying a point in time or the time period between two such points.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → model.textPhraseLike → <date>

**<decoDesc>** Contains a description of the decoration of an item.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → <decoDesc>

**<decoNote>** Contains a description of one or more decorative features of an item.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → <decoNote>

**<dedicatee>** Entity to whom a creative work is formally offered.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → <dedicatee>

**<dedication>** Contains a dedicatory statement.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → <dedication>

**<del>** Contains information deleted, marked as deleted, or otherwise indicated as superfluous or spurious in the copy text by an author, scribe, annotator, or corrector.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → model.editTransPart.text → model.editTransPart → <del>

**<depth>** Description of a measurement taken through a three-dimensional object.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → <depth>

**<desc>** Container for text that briefly describes the feature to which it is attached, including its intended usage, purpose, or application as appropriate.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → <desc>

**<dim>** Any single dimensional specification.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → <dim>

**<dir>** An instruction expressed as a combination of text and symbols, typically above, below, or between staves, but not on the staff — that is not encoded elsewhere in more specific elements, like **<tempo>**, **<dynam>** or **<repeatMark>**.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → <dir>

**<distributor>** Person or agency, other than a publisher, from which access (including electronic access) to a bibliographic entity may be obtained.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → <distributor>

**<district>** Contains the name of any kind of subdivision of a settlement, such as a parish, ward, or other administrative or geographic unit.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → model.textPhraseLike → <district>

**<dynam>** Indication of the volume of a note, phrase, or section of music.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → <dynam>

**<edition>** A word or text phrase that indicates a difference in either content or form between the item being described and a related item previously issued by the same publisher/distributor (e.g., 2nd edition, version 2.0, etc.), or simultaneously issued by either the same publisher/distributor or another publisher/distributor (e.g., large print edition, British edition, etc.).

<biblStruct> → model.biblLike → model.textPhraseLike.limited → <edition>

**<editor>** The name of the individual(s), institution(s) or organization(s) acting in an editorial capacity.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → <editor>

**<epigraph>** Contains a quotation, anonymous or attributed, appearing on a title page.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → model.textPhraseLike → model.paraccontentPart → <epigraph>

**<exhibHist>** A record of public exhibitions, including dates, venues, etc.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → <exhibHist>

**<expan>** Contains the expansion of an abbreviation.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → model.editTransPart.text → model.editTransPart → <expan>

**<extent>** Used to express size in terms other than physical dimensions, such as number of pages, records, bytes, physical components, etc.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → <extent>

**<f>** Single element of a figured bass indication.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → <f>

**<famName>** Contains a family (inherited) name, as opposed to a given, baptismal, or nick name.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → model.textPhraseLike → <famName>

**<figDesc>** Contains a brief prose description of the appearance or content of a graphic figure, for use when documenting an image without displaying it.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → <figDesc>

**<fing>** finger – An individual finger in a fingering indication.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → <fing>

**<foreName>** Contains a forename, given or baptismal name.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → model.textPhraseLike → <foreName>

**<funder>** Names of individuals, institutions, or organizations responsible for funding. Funders provide financial support for a project; they are distinct from sponsors, who provide intellectual support and authority.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → <funder>

**<genName>** Contains a name component used to distinguish otherwise similar names on the basis of the relative ages or generations of the persons named.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → model.textPhraseLike → <genName>

**<genre>** Term or terms that designate a category characterizing a particular style, form, or content.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → <genre>

**<geogFeat>** Contains a common noun identifying a geographical feature.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → model.textPhraseLike → <geogFeat>

**<geogName>** The proper noun designation for a place, natural feature, or political jurisdiction.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → model.textPhraseLike → <geogName>

**<gliss>** A continuous or sliding movement from one pitch to another, usually indicated by a straight or wavy line.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → <gliss>

**<hand>** Defines a distinct scribe or handwriting style.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → <hand>

**<harm>** An indication of harmony, e.g., chord names, tablature grids, harmonic analysis, figured bass.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → <harm>

**<head>** Contains any heading, for example, the title of a section of text, or the heading of a list.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → model.textPhraseLike → <head>

**<height>** Description of the vertical size of an object.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → <height>

**<identifier>** An alpha-numeric string that establishes the identity of the described material.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → model.textPhraseLike → <identifier>

**<imprimatur>** Contains a formal statement authorizing the publication of a work, sometimes required to appear on a title page or its verso.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → model.textPhraseLike → model.paracontentPart → <imprimatur>

**<imprint>** Information relating to the publication or distribution of a bibliographic item.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → model.textPhraseLike → <imprint>

**<I>** Contains a single line of text within a line group.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → model.textPhraseLike → <I>

**<label>** A container for document text that identifies the feature to which it is attached. For a "tool tip" or other generated label, use the label attribute.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → <label>

**<labelAbbr>** A label on the pages following the first.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → <labelAbbr>

**<language>** Description of a language used in the document.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → <language>

**<layoutDesc>** Collects layout descriptions.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → <layoutDesc>

**<lem>** (lemma) – Contains the lemma, or base text, of a textual variation.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → model.rdgPart.text → model.rdgPart → <lem>

**<li>** Single item in a <list>.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → model.textPhraseLike → <li>

**<librettist>** Person or organization who is a writer of the text of an opera, oratorio, etc.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → <librettist>

**<line>** A visual line that cannot be represented by a more specific; i.e., semantic, element.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → <line>

**<lyricist>** Person or organization who is a writer of the text of a song.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → <lyricist>

**<metaMark>** A graphical or textual statement with additional / explanatory information about the musical text. The textual consequences of this intervention are encoded independently via other means; that is, with elements such as **<add>**, **<del>**, etc.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → <metaMark>

**<name>** Proper noun or noun phrase.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → model.textPhraseLike → <name>

**<nameLink>** Contains a connecting phrase or link used within a name but not regarded as part of it, such as "van der" or "of", "from", etc.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → model.textPhraseLike → <nameLink>

**<num>** Numeric information in any form.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → model.textPhraseLike → <num>

**<octave>** An indication that a passage should be performed one or more octaves above or below its written pitch.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → <octave>

**<orig>** Contains material which is marked as following the original, rather than being normalized or corrected.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → model.editTransPart.text → model.editTransPart → <orig>

**<ornam>** An element indicating an ornament that is not a mordent, turn, or trill.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → <ornam>

**<p>** One or more text phrases that form a logical prose passage.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → model.textPhraseLike → model.paracontentPart → <p>

**<perfRes>** Name of an instrument on which a performer plays, a performer's voice range, or a standard performing ensemble designation.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → <perfRes>

**<periodName>** A label that describes a period of time, such as 'Baroque' or '3rd Style period'.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → model.textPhraseLike → <periodName>

**<persName>** Designation for an individual, including any or all of that individual's forenames, surnames, honorific titles, and added names.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → model.textPhraseLike → <persName>

**<pgFoot>** A running footer.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → <pgFoot>

**<pgHead>** A running header.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → <pgHead>

**<price>** The cost of access to a bibliographic item.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → <price>

**<provenance>** The record of ownership or custodianship of an item.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → <provenance>

**<pubPlace>** Name of the place where a bibliographic item was published.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → <pubPlace>

**<publisher>** Name of the organization responsible for the publication of a bibliographic item.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → <publisher>

**<q>** Contains material which is distinguished from the surrounding phrase-level text using quotation marks or a similar method. Use **<quote>** for block-level quotations.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → model.textPhraseLike → <q>

**<quote>** Contains a paragraph-like block of text attributed to an external source, normally set off from the surrounding text by spacing or other typographic distinction.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → model.textPhraseLike → model.paracontentPart → <quote>

**<rdg>** (reading) – Contains a single reading within a textual variation.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → model.rdgPart.text → model.rdgPart → <rdg>

**<recipient>** The name of the individual(s), institution(s) or organization(s) receiving correspondence.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → <recipient>

**<ref>** Defines a traversible reference to another location. May contain text and sub-elements that describe the destination.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → model.textPhraseLike → <ref>

**<reg>** Contains material which has been regularized or normalized in some sense.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → model.editTransPart.text → model.editTransPart → <reg>

**<region>** Contains the name of an administrative unit such as a state, province, or county, larger than a settlement, but smaller than a country.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → model.textPhraseLike → <region>

**<relatedItem>** Contains or references another bibliographic item which is related to the present one.

<biblStruct> → model.biblLike → <relatedItem>

**<rend>** A formatting element indicating special visual rendering, e.g., bold or italicized, of a text word or phrase.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → model.textPhraseLike → <rend>

**<repeatMark>** An instruction expressed as a combination of text and symbols – segno and coda – typically above, below, or between staves, but not on the staff.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → <repeatMark>

**<repository>** Institution, agency, or individual which holds a bibliographic item.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → <repository>

**<resp>** A phrase describing the nature of intellectual responsibility.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → <resp>

**<restore>** Indicates restoration of material to an earlier state by cancellation of an editorial or authorial marking or instruction.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → model.editTransPart.text → model.editTransPart → <restore>

**<role>** Name of a dramatic role, as given in a cast list.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → <role>

**<roleDesc>** Describes a character's role in a drama.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → <roleDesc>

**<roleName>** Contains a name component which indicates that the referent has a particular role or position in society, such as an official title or rank.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → model.textPhraseLike → <roleName>

**<scriptDesc>** Contains a description of the letters or characters used in an autographic item.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → <scriptDesc>

**<seal>** A single seal or similar attachment.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → <seal>

**<sealDesc>** Describes the seals or similar external attachments applied to an item.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → <sealDesc>

**<seg>** (arbitrary segment) represents any segmentation of text below the "text component" level.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → model.textPhraseLike → <seg>

**<settlement>** Contains the name of a settlement such as a city, town, or village identified as a single geopolitical or administrative unit.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → model.textPhraseLike → <settlement>

**<sic>** Contains apparently incorrect or inaccurate material.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → model.editTransPart.text → model.editTransPart → <sic>

**<signifLet>** Significantive letter(s).

<biblStruct> → model.biblLike → model.textPhraseLike.limited → <signifLet>

**<soundChan>** Reflects the number of apparent sound channels in the playback of a recording (monaural, stereophonic, quadraphonic, etc.).

<biblStruct> → model.biblLike → model.textPhraseLike.limited → <soundChan>

**<source>** A bibliographic description of a source used in the creation of the electronic file.

<biblStruct> → model.biblLike → <source>

**<speaker>** Contains a specialized form of heading or label, giving the name of one or more speakers in a dramatic text or fragment.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → <speaker>

**<sponsor>** Names of sponsoring individuals, organizations or institutions. Sponsors give their intellectual authority to a project; they are to be distinguished from funders, who provide the funding but do not necessarily take intellectual responsibility.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → <sponsor>

**<stack>** An inline table with a single column.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → <stack>

**<stageDir>** Contains any kind of stage direction within a dramatic text or fragment.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → <stageDir>

**<street>** full street address including any name or number identifying a building as well as the name of the street or route on which it is located.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → model.textPhraseLike → <street>

**<styleName>** A label for a characteristic style of writing or performance, such as 'bebop' or 'rock-n-roll'.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → model.textPhraseLike → <styleName>

**<supplied>** Contains material supplied by the transcriber or editor for any reason.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → model.editTransPart.text → model.editTransPart → <supplied>

**<supportDesc>** Groups elements describing the physical support material of an item.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → <supportDesc>

**<syl>** Individual lyric syllable.

<biblStruct> → model.biblLike → model.textPhraseLike.limited → <syl>

**<taxonomy>** Defines a typology either implicitly, by means of a bibliographic citation, or explicitly by a structured taxonomy.

<biblStruct> → [model.biblLike](#) → <taxonomy>

**<td>** Designates a table cell that contains data as opposed to a cell that contains column or row heading information.

<biblStruct> → [model.biblLike](#) → [model.textPhraseLike.limited](#) → [model.textPhraseLike](#) → <td>

**<tempo>** Text and symbols descriptive of tempo, mood, or style, e.g., "allarg.", "a tempo", "cantabile", "Moderato", "J=60", "Moderato J =60").

<biblStruct> → [model.biblLike](#) → [model.textPhraseLike.limited](#) → <tempo>

**<term>** Keyword or phrase which describes a resource.

<biblStruct> → [model.biblLike](#) → [model.textPhraseLike.limited](#) → <term>

**<textLang>** Identifies the languages and writing systems within the work described by a bibliographic description, not the language of the description.

<biblStruct> → [model.biblLike](#) → [model.textPhraseLike.limited](#) → <textLang>

**<th>** Designates a table cell containing column or row heading information as opposed to one containing data.

<biblStruct> → [model.biblLike](#) → [model.textPhraseLike.limited](#) → [model.textPhraseLike](#) → <th>

**<treatHist>** A record of the treatment the item has undergone (e.g., de-acidification, restoration, etc.).

<biblStruct> → [model.biblLike](#) → [model.textPhraseLike.limited](#) → <treatHist>

**<treatSched>** Scheduled treatment, e.g., de-acidification, restoration, etc., for an item.

<biblStruct> → [model.biblLike](#) → [model.textPhraseLike.limited](#) → <treatSched>

**<typeDesc>** Contains a description of the typefaces or other aspects of the printing of a printed source.

<biblStruct> → [model.biblLike](#) → [model.textPhraseLike.limited](#) → <typeDesc>

**<unclear>** Contains material that cannot be transcribed with certainty because it is illegible or inaudible in the source.

<biblStruct> → [model.biblLike](#) → [model.textPhraseLike.limited](#) → [model.editTransPart.text](#) → [model.editTransPart](#) → <unclear>

**<width>** Description of the horizontal size of an object.

<biblStruct> → [model.biblLike](#) → [model.textPhraseLike.limited](#) → <width>

## May Contain

**<analytic>** Contains bibliographic elements describing an item (e.g., an article or poem) published within a monograph or journal and not as an independent publication.

<biblStruct> → direct children → <analytic>

**<annot>** Provides a statement explaining the text or indicating the basis for an assertion.

<biblStruct> → [model.annotLike](#) → <annot>

**<identifier>** An alpha-numeric string that establishes the identity of the described material.

<biblStruct> → direct children → <identifier>

**<monogr>** Contains bibliographic elements describing an item, for example, a published book or journal, score, recording, or an unpublished manuscript.

<biblStruct> → direct children → <monogr>

**<relatedItem>** Contains or references another bibliographic item which is related to the present one.

<biblStruct> → direct children → <relatedItem>

**<series>** Contains information about the serial publication in which a bibliographic item has appeared.  
 <biblStruct> → direct children → <series>

## Declaration

## <bifolium>

Describes a folded sheet of paper.

### Referenced in chapters

[3.7.2 Description of folia](#), [3.7.2.1 Linking surface elements](#), [3.7.2.2 Specifying page dimensions](#), [3.7.2.3 Patches](#), [3.7.2.4 Cutouts](#)

### Module

[MEI.header](#)

### Attributes

**@class** (*optional*) Contains one or more URIs which denote classification terms that apply to the entity bearing this attribute. One or more values from [data.URI](#), separated by spaces.

<bifolium> → [att.common](#) → [att.typed](#) → [att.classed](#) → @class

**@copyof** (*optional*) Points to an element of which the current element is a copy. Value conforms to [data.URI](#).

<bifolium> → [att.common](#) → [att.linked](#) → @copyof

**@corresp** (*optional*) Used to point to other elements that correspond to this one in a generic fashion. One or more values from [data.URI](#), separated by spaces.

<bifolium> → [att.common](#) → [att.linked](#) → @corresp

**@follows** (*optional*) points to one or more events in a user-defined collection that are known to be predecessors of the current element. One or more values from [data.URI](#), separated by spaces.

<bifolium> → [att.common](#) → [att.linked](#) → @follows

**@height** (*optional*) Measurement of the vertical dimension of an entity. Value conforms to [data.MEASUREMENTUNSIGNED](#).

<bifolium> → [att.dimensions](#) → [att.height](#) → @height

**@inner.recto** (*optional*) A reference to a [<surface>](#) element positioned on the inner recto side of a (folded) sheet. Value conforms to [data.URI](#).

<bifolium> → [att.bifoliumSurfaces](#) → @inner.recto

**@inner.verso** (*optional*) A reference to a [<surface>](#) element positioned on the inner verso side of a (folded) sheet. Value conforms to [data.URI](#).

<bifolium> → [att.bifoliumSurfaces](#) → @inner.verso

**@label** (*optional*) Captures text to be used to generate a label for the element to which it's attached, a "tool tip" or prefatory text, for example. Should not be used to record document content. Value is plain text.

<bifolium> → [att.common](#) → [att.labelled](#) → @label

**@on** (*optional*) Provides a number-like designation that indicates an element's position in a sequence of similar elements. May not contain space characters. Value conforms to [data.WORD](#).

<bifolium> → [att.common](#) → [att.nNumberLike](#) → @on

**@next** (*optional*) Used to point to the next event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<bifolium> → [att.common](#) → [att.linked](#) → @next

**@outer.recto** (*optional*) A reference to a <surface> element positioned on the outer recto side of a (folded) sheet. Value conforms to [data.URI](#).

<bifolium> → [att.bifoliumSurfaces](#) → @outer.recto

**@outer.verso** (*optional*) A reference to a <surface> element positioned on the outer verso side of a (folded) sheet. Value conforms to [data.URI](#).

<bifolium> → [att.bifoliumSurfaces](#) → @outer.verso

**@precedes** (*optional*) Points to one or more events in a user-defined collection that are known to be successors of the current element. One or more values from [data.URI](#), separated by spaces.

<bifolium> → [att.common](#) → [att.linking](#) → @precedes

**@prev** (*optional*) Points to the previous event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<bifolium> → [att.common](#) → [att.linking](#) → @prev

**@resp** (*optional*) Indicates the agent(s) responsible for some aspect of the text's transcription, editing, or encoding. Its value must point to one or more identifiers declared in the document header. One or more values from [data.URI](#), separated by spaces.

<bifolium> → [att.common](#) → [att.responsibility](#) → @resp

**@sameas** (*optional*) Points to an element that is the same as the current element but is not a literal copy of the current element. One or more values from [data.URI](#), separated by spaces.

<bifolium> → [att.common](#) → [att.linking](#) → @sameas

**@synch** (*optional*) Points to elements that are synchronous with the current element. One or more values from [data.URI](#), separated by spaces.

<bifolium> → [att.common](#) → [att.linking](#) → @synch

**@type** (*optional*) Designation which characterizes the element in some sense, using any convenient classification scheme or typology that employs single-token labels. One or more values of datatype **NMTOKEN**, separated by spaces.

<bifolium> → [att.common](#) → [att.typed](#) → @type

**@unit** (*optional*) Indicates the unit of measurement. Allowed values are: "byte" (Byte.), "char" (Character.), "cm" (Centimeter.), "deg" (Degree.), "in" (Inch.), "issue" (Serial issue.), "ft" (Foot.), "m" (Meter.), "mm" (Millimeter.), "page" (Page.), "pc" (Pica.), "pt" (Point.), "px" (Pixel.), "rad" (Radian.), "record" (Record.), "vol" (Serial volume.), "vu" (MEI virtual unit.)

<bifolium> → [att.measurement](#) → @unit

**@width** (*optional*) Measurement of the horizontal dimension of an entity. Value conforms to [data.MEASUREMENTUNSIGNED](#).

<bifolium> → [att.dimensions](#) → [att.width](#) → @width

**@xml:base** (*optional*) Provides a base URI reference with which applications can resolve relative URI references into absolute URI references. Value conforms to [data.URI](#).

<bifolium> → [att.common](#) → [att.basic](#) → @xml:base

**@xml:id** (*optional*) Regularizes the naming of an element and thus facilitates building links between it and other resources. Each id attribute within a document must have a unique value. Value is a valid [xml:id](#).

<bifolium> → [att.common](#) → [att.basic](#) → [att.id](#) → @xml:id

## Member of

[model.bifoliumLike](#) Collects bifoliumlike elements.

### Contained By

**<bifolium>** Describes a folded sheet of paper.

<bifolium> → [model.bifoliumLike](#) → <bifolium>

**<cutout>** A cutout is a section of a document sheet that has been removed and is now missing.

<bifolium> → [model.bifoliumLike](#) → <cutout>

**<foliaDesc>** Describes the order of folia and bifolia making up the text block of a manuscript or print.

<bifolium> → [model.bifoliumLike](#) → <foliaDesc>

**<patch>** Describes a physical writing surface attached to the original document.

<bifolium> → [model.bifoliumLike](#) → <patch>

### May Contain

**<add>** Marks an addition to the text.

<bifolium> → direct children → <add>

**<bifolium>** Describes a folded sheet of paper.

<bifolium> → [model.bifoliumLike](#) → <bifolium>

**<cutout>** A cutout is a section of a document sheet that has been removed and is now missing.

<bifolium> → [model.paperModLike](#) → <cutout>

**<damage>** Contains an area of damage to the physical medium.

<bifolium> → direct children → <damage>

**<del>** Contains information deleted, marked as deleted, or otherwise indicated as superfluous or spurious in the copy text by an author, scribe, annotator, or corrector.

<bifolium> → direct children → <del>

**<folium>** Describes a single leaf of paper.

<bifolium> → [model.foliumLike](#) → <folium>

**<gap>** Indicates a point where material has been omitted in a transcription, whether as part of sampling practice or for editorial reasons described in the MEI header.

<bifolium> → direct children → <gap>

**<patch>** Describes a physical writing surface attached to the original document.

<bifolium> → [model.paperModLike](#) → <patch>

**<restore>** Indicates restoration of material to an earlier state by cancellation of an editorial or authorial marking or instruction.

<bifolium> → direct children → <restore>

## <binding>

(binding) – Contains a description of one binding, i.e., type of covering, boards, etc. applied to an item.

### Module

[MEI.msDesc](#)

### Attributes

**@analog** (*optional*) Contains a reference to a field or element in another descriptive encoding system to which this MEI element is comparable. Value is plain text.

<binding> → [att.bibl](#) → @analog

**@class** (*optional*) Contains one or more URIs which denote classification terms that apply to the entity bearing this attribute. One or more values from [data.URI](#), separated by spaces.

<binding> → [att.common](#) → [att.typed](#) → [att.classed](#) → @class

**@contemporary** (*optional*) Value conforms to [data.BOOLEAN](#).

<binding> → direct children → @contemporary

**@copyof** (*optional*) Points to an element of which the current element is a copy. Value conforms to [data.URI](#).

<binding> → [att.common](#) → [att.linked](#) → @copyof

**@corresp** (*optional*) Used to point to other elements that correspond to this one in a generic fashion. One or more values from [data.URI](#), separated by spaces.

<binding> → [att.common](#) → [att.linked](#) → @corresp

**@enddate** (*optional*) Contains the end point of a date range in standard ISO form. Value conforms to [data.ISODATE](#).

<binding> → [att.datable](#) → @enddate

**@follows** (*optional*) points to one or more events in a user-defined collection that are known to be predecessors of the current element. One or more values from [data.URI](#), separated by spaces.

<binding> → [att.common](#) → [att.linked](#) → @follows

**@isodate** (*optional*) Provides the value of a textual date in standard ISO form. Value conforms to [data.ISODATE](#).

<binding> → [att.datable](#) → @isodate

**@label** (*optional*) Captures text to be used to generate a label for the element to which it's attached, a "tool tip" or prefatory text, for example. Should not be used to record document content. Value is plain text.

<binding> → [att.common](#) → [att.labelled](#) → @label

**@n** (*optional*) Provides a number-like designation that indicates an element's position in a sequence of similar elements. May not contain space characters. Value conforms to [data.WORD](#).

<binding> → [att.common](#) → [att.nNumberLike](#) → @n

**@next** (*optional*) Used to point to the next event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<binding> → [att.common](#) → [att.linked](#) → @next

**@notafter** (*optional*) Contains an upper boundary for an uncertain date in standard ISO form. Value conforms to [data.ISODATE](#).

<binding> → att.datable → @notafter

**@notbefore** (*optional*) Contains a lower boundary, in standard ISO form, for an uncertain date. Value conforms to [data.ISODATE](#).

<binding> → att.datable → @notbefore

**@precedes** (*optional*) Points to one or more events in a user-defined collection that are known to be successors of the current element. One or more values from [data.URI](#), separated by spaces.

<binding> → att.common → att.linkin → @precedes

**@prev** (*optional*) Points to the previous event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<binding> → att.common → att.linkin → @prev

**@resp** (*optional*) Indicates the agent(s) responsible for some aspect of the text's transcription, editing, or encoding. Its value must point to one or more identifiers declared in the document header. One or more values from [data.URI](#), separated by spaces.

<binding> → att.common → att.responsibility → @resp

**@sameas** (*optional*) Points to an element that is the same as the current element but is not a literal copy of the current element. One or more values from [data.URI](#), separated by spaces.

<binding> → att.common → att.linkin → @sameas

**@startdate** (*optional*) Contains the starting point of a date range in standard ISO form. Value conforms to [data.ISODATE](#).

<binding> → att.datable → @startdate

**@synch** (*optional*) Points to elements that are synchronous with the current element. One or more values from [data.URI](#), separated by spaces.

<binding> → att.common → att.linkin → @synch

**@translit** (*optional*) Specifies the transliteration technique used. Value is a [NMOKEN](#).

<binding> → att.lang → @translit

**@type** (*optional*) Designation which characterizes the element in some sense, using any convenient classification scheme or typology that employs single-token labels. One or more values of datatype [NMOKEN](#), separated by spaces.

<binding> → att.common → att.typed → @type

**@xml:base** (*optional*) Provides a base URI reference with which applications can resolve relative URI references into absolute URI references. Value conforms to [data.URI](#).

<binding> → att.common → att.basic → @xml:base

**@xml:id** (*optional*) Regularizes the naming of an element and thus facilitates building links between it and other resources. Each id attribute within a document must have a unique value. Value is a valid [xml:id](#).

<binding> → att.common → att.basic → att.id → @xml:id

**@xml:lang** (*optional*) Identifies the language of the element's content. The values for this attribute are language 'tags' as defined in BCP 47. All language tags that make use of private use sub-tags must be documented in a corresponding language element in the MEI header whose id attribute is the same as the language tag's value. Value is a [language](#).

<binding> → att.lang → @xml:lang

## Member of

(binding isn't member of any model class)

### Contained By

**<bindingDesc>** Describes the present and former bindings of an item.

<binding> → elements having binding as direct children → <bindingDesc>

### May Contain

**<condition>** The physical condition of an item, particularly any variances between the physical make-up of the item and that of other copies of the same item (e.g., missing pages or plates, brittleness, faded images, etc.).

<binding> → direct children → <condition>

**<decoNote>** Contains a description of one or more decorative features of an item.

<binding> → direct children → <decoNote>

**<dimensions>** Information about the physical size of an entity; usually includes numerical data.

<binding> → direct children → <dimensions>

**<head>** Contains any heading, for example, the title of a section of text, or the heading of a list.

<binding> → direct children → <head>

**<p>** One or more text phrases that form a logical prose passage.

<binding> → direct children → <p>

### Remarks

The model of this element is based on the [binding](#) element of the Text Encoding Initiative (TEI).

### Declaration

## <bindingDesc>

(binding description) – Describes the present and former bindings of an item.

### Module

[MEI.msDesc](#)

### Attributes

**@analog** (*optional*) Contains a reference to a field or element in another descriptive encoding system to which this MEI element is comparable. Value is plain text.

<bindingDesc> → [att.bibl](#) → @analog

**@class** (*optional*) Contains one or more URIs which denote classification terms that apply to the entity bearing this attribute. One or more values from [data.URI](#), separated by spaces.

<bindingDesc> → [att.common](#) → [att.typed](#) → [att.classe](#)d → @class

**@copyof** (*optional*) Points to an element of which the current element is a copy. Value conforms to [data.URI](#).

<bindingDesc> → [att.common](#) → [att.linking](#) → @copyof

**@corresp** (*optional*) Used to point to other elements that correspond to this one in a generic fashion. One or more values from [data.URI](#), separated by spaces.

<bindingDesc> → [att.common](#) → [att.linking](#) → @corresp

**@follows** (*optional*) points to one or more events in a user-defined collection that are known to be predecessors of the current element. One or more values from [data.URI](#), separated by spaces.

<bindingDesc> → [att.common](#) → [att.linking](#) → @follows

**@label** (*optional*) Captures text to be used to generate a label for the element to which it's attached, a "tool tip" or prefatory text, for example. Should not be used to record document content. Value is plain text.

<bindingDesc> → [att.common](#) → [att.labelled](#) → @label

**@n** (*optional*) Provides a number-like designation that indicates an element's position in a sequence of similar elements. May not contain space characters. Value conforms to [data.WORD](#).

<bindingDesc> → [att.common](#) → [att.nNumberLike](#) → @n

**@next** (*optional*) Used to point to the next event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<bindingDesc> → [att.common](#) → [att.linking](#) → @next

**@precedes** (*optional*) Points to one or more events in a user-defined collection that are known to be successors of the current element. One or more values from [data.URI](#), separated by spaces.

<bindingDesc> → [att.common](#) → [att.linking](#) → @precedes

**@prev** (*optional*) Points to the previous event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<bindingDesc> → [att.common](#) → [att.linking](#) → @prev

**@resp** (*optional*) Indicates the agent(s) responsible for some aspect of the text's transcription, editing, or encoding. Its value must point to one or more identifiers declared in the document header. One or more values from [data.URI](#), separated by spaces.

<bindingDesc> → [att.common](#) → [att.responsibility](#) → @resp

**@sameas** (*optional*) Points to an element that is the same as the current element but is not a literal copy of the current element. One or more values from [data.URI](#), separated by spaces.

<bindingDesc> → att.common → att.linking → @sameas

**@synch** (*optional*) Points to elements that are synchronous with the current element. One or more values from [data.URI](#), separated by spaces.

<bindingDesc> → att.common → att.linking → @synch

**@translit** (*optional*) Specifies the transliteration technique used. Value is a [NMTOKEN](#).

<bindingDesc> → att.lang → @translit

**@type** (*optional*) Designation which characterizes the element in some sense, using any convenient classification scheme or typology that employs single-token labels. One or more values of datatype [NMTOKEN](#), separated by spaces.

<bindingDesc> → att.common → att.typed → @type

**@xml:base** (*optional*) Provides a base URI reference with which applications can resolve relative URI references into absolute URI references. Value conforms to [data.URI](#).

<bindingDesc> → att.common → att.basic → @xml:base

**@xml:id** (*optional*) Regularizes the naming of an element and thus facilitates building links between it and other resources. Each id attribute within a document must have a unique value. Value is a valid [xml:id](#).

<bindingDesc> → att.common → att.basic → att.id → @xml:id

**@xml:lang** (*optional*) Identifies the language of the element's content. The values for this attribute are language 'tags' as defined in BCP 47. All language tags that make use of private use sub-tags must be documented in a corresponding language element in the MEI header whose id attribute is the same as the language tag's value. Value is a [language](#).

<bindingDesc> → att.lang → @xml:lang

## Member of

[model.physDescPart](#) Groups elements that may appear as part of the physical description of a bibliographic item.

## Contained By

**<physDesc>** Container for information about the appearance, construction, or handling of physical materials, such as their dimension, quantity, color, style, and technique of creation.

<bindingDesc> → model.physDescPart → <physDesc>

## May Contain

**<abbr>** A generic element for 1) a shortened form of a word, including an acronym or 2) a shorthand notation.

<bindingDesc> → model.textPhraseLike.limited → model.editorialLike → <abbr>

**<address>** Contains a postal address, for example of a publisher, an organization, or an individual.

<bindingDesc> → model.textPhraseLike.limited → model.addressLike → <address>

**<annot>** Provides a statement explaining the text or indicating the basis for an assertion.

<bindingDesc> → model.textPhraseLike.limited → model.annotLike → <annot>

**<bibl>** Provides a loosely-structured bibliographic citation in which the sub-components may or may not be explicitly marked.

<bindingDesc> → model.textPhraseLike.limited → model.biblLike → <bibl>

**<biblStruct>** Contains a bibliographic citation in which bibliographic sub-elements must appear in a specified order.

<bindingDesc> → model.textPhraseLike.limited → model.biblLike → <biblStruct>

**<binding>** Contains a description of one binding, i.e., type of covering, boards, etc. applied to an item.

<bindingDesc> → direct children → <binding>

**<bloc>** Contains the name of a geopolitical unit consisting of two or more nation states or countries.

<bindingDesc> → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <bloc>

**<catchwords>** Describes the system used to ensure correct ordering of the quires making up an item, typically by means of annotations at the foot of the page.

<bindingDesc> → model.textPhraseLike.limited → model.msInline → <catchwords>

**<condition>** The physical condition of an item, particularly any variances between the physical make-up of the item and that of other copies of the same item (e.g., missing pages or plates, brittleness, faded images, etc.).

<bindingDesc> → direct children → <condition>

**<corpName>** Identifies an organization or group of people that acts as a single entity.

<bindingDesc> → model.textPhraseLike.limited → model.nameLike → model.nameLike.agent → <corpName>

**<country>** Contains the name of a geopolitical unit, such as a nation, country, colony, or commonwealth, larger than or administratively superior to a region and smaller than a bloc.

<bindingDesc> → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <country>

**<date>** A string identifying a point in time or the time period between two such points.

<bindingDesc> → model.textPhraseLike.limited → model.dateLike → <date>

**<decoNote>** Contains a description of one or more decorative features of an item.

<bindingDesc> → direct children → <decoNote>

**<dedicatee>** Entity to whom a creative work is formally offered.

<bindingDesc> → model.textPhraseLike.limited → <dedicatee>

**<depth>** Description of a measurement taken through a three-dimensional object.

<bindingDesc> → model.textPhraseLike.limited → model.dimLike → <depth>

**<dim>** Any single dimensional specification.

<bindingDesc> → model.textPhraseLike.limited → model.dimLike → <dim>

**<dimensions>** Information about the physical size of an entity; usually includes numerical data.

<bindingDesc> → model.textPhraseLike.limited → <dimensions>

**<district>** Contains the name of any kind of subdivision of a settlement, such as a parish, ward, or other administrative or geographic unit.

<bindingDesc> → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <district>

**<expan>** Contains the expansion of an abbreviation.

<bindingDesc> → model.textPhraseLike.limited → model.editorialLike → <expan>

**<extent>** Used to express size in terms other than physical dimensions, such as number of pages, records, bytes, physical components, etc.

<bindingDesc> → model.textPhraseLike.limited → <extent>

**<fig>** Groups elements representing or containing graphic information such as an illustration or figure.

<bindingDesc> → model.textPhraseLike.limited → model.figureLike → <fig>

**<geogFeat>** Contains a common noun identifying a geographical feature.

<bindingDesc> → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <geogFeat>

**<geogName>** The proper noun designation for a place, natural feature, or political jurisdiction.

<bindingDesc> → model.textPhraseLike.limited → model.nameLike → model.nameLike.place → model.nameLike.geogName → <geogName>

**<head>** Contains any heading, for example, the title of a section of text, or the heading of a list.

<bindingDesc> → direct children → <head>

**<height>** Description of the vertical size of an object.

<bindingDesc> → model.textPhraseLike.limited → model.dimLike → <height>

**<heraldry>** Contains a heraldic formula or phrase, typically found as part of a blazon, coat of arms, etc.

<bindingDesc> → model.textPhraseLike.limited → model.msInline → <heraldry>

**<identifier>** An alpha-numeric string that establishes the identity of the described material.

<bindingDesc> → model.textPhraseLike.limited → model.identifierLike → <identifier>

**<lb>** An empty formatting element that forces text to begin on a new line.

<bindingDesc> → model.textPhraseLike.limited → model.lbLike → <lb>

**<locus>** Defines a location within a manuscript or manuscript component, usually as a (possibly discontinuous) sequence of folio references.

<bindingDesc> → model.textPhraseLike.limited → model.msInline → <locus>

**<locusGrp>** Groups locations which together form a distinct but discontinuous item within a manuscript or manuscript part, according to a specific foliation.

<bindingDesc> → model.textPhraseLike.limited → model.msInline → <locusGrp>

**<name>** Proper noun or noun phrase.

<bindingDesc> → model.textPhraseLike.limited → model.nameLike → <name>

**<num>** Numeric information in any form.

<bindingDesc> → model.textPhraseLike.limited → model.measurementLike → model.numLike → <num>

**<p>** One or more text phrases that form a logical prose passage.

<bindingDesc> → direct children → <p>

**<periodName>** A label that describes a period of time, such as 'Baroque' or '3rd Style period'.

<bindingDesc> → model.textPhraseLike.limited → model.nameLike.label → <periodName>

**<persName>** Designation for an individual, including any or all of that individual's forenames, surnames, honorific titles, and added names.

<bindingDesc> → model.textPhraseLike.limited → model.nameLike → model.nameLike.agent → <persName>

**<postBox>** (postal box or post office box) contains a number or other identifier for some postal delivery point other than a street address.

<bindingDesc> → model.textPhraseLike.limited → model.addressPart → <postBox>

**<postCode>** (postal code) contains a numerical or alphanumeric code used as part of a postal address to simplify sorting or delivery of mail.

<bindingDesc> → model.textPhraseLike.limited → model.addressPart → <postCode>

**<ptr>** Defines a traversible pointer to another location, using only attributes to describe the destination.

<bindingDesc> → model.textPhraseLike.limited → model.locrefLike → <ptr>

**<q>** Contains material which is distinguished from the surrounding phrase-level text using quotation marks or a similar method. Use **<quote>** for block-level quotations.

<bindingDesc> → model.textPhraseLike.limited → model.qLike → <q>

**<ref>** Defines a traversible reference to another location. May contain text and sub-elements that describe the destination.

<bindingDesc> → model.textPhraseLike.limited → model.locrefLike → <ref>

**<region>** Contains the name of an administrative unit such as a state, province, or county, larger than a settlement, but smaller than a country.

<bindingDesc> → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <region>

**<relation>** Describes a relationship or linkage amongst entities.

<bindingDesc> → model.textPhraseLike.limited → model.relationLike → <relation>

**<relationList>** Gathers relation elements.

<bindingDesc> → model.textPhraseLike.limited → model.relationLike → <relationList>

**<rend>** A formatting element indicating special visual rendering, e.g., bold or italicized, of a text word or phrase.

<bindingDesc> → model.textPhraseLike.limited → model.rendLike → <rend>

**<repository>** Institution, agency, or individual which holds a bibliographic item.

<bindingDesc> → model.textPhraseLike.limited → model.nameLike → model.nameLike.place → model.repositoryLike → <repository>

**<secFolio>** Marks the word or words taken from a fixed point in a codex (typically the beginning of the second leaf) in order to provide a unique identifier for the item.

<bindingDesc> → model.textPhraseLike.limited → model.msInline → <secFolio>

**<seg>** (arbitrary segment) represents any segmentation of text below the "text component" level.

<bindingDesc> → model.textPhraseLike.limited → <seg>

**<settlement>** Contains the name of a settlement such as a city, town, or village identified as a single geopolitical or administrative unit.

<bindingDesc> → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <settlement>

**<signatures>** Provides a description of the leaf or quire signatures found within a codex.

<bindingDesc> → model.textPhraseLike.limited → model.msInline → <signatures>

**<stack>** An inline table with a single column.

<bindingDesc> → model.textPhraseLike.limited → model.rendLike → <stack>

**<stamp>** Contains a word or phrase describing an official mark indicating ownership, genuineness, validity, etc.

<bindingDesc> → model.textPhraseLike.limited → model.msInline → <stamp>

**<street>** full street address including any name or number identifying a building as well as the name of the street or route on which it is located.

<bindingDesc> → model.textPhraseLike.limited → model.addressPart → <street>

**<styleName>** A label for a characteristic style of writing or performance, such as 'bebop' or 'rock-n-roll'.

<bindingDesc> → model.textPhraseLike.limited → model.nameLike.label → <styleName>

**<symbol>** A reference to a previously defined symbol.

<bindingDesc> → model.textPhraseLike.limited → <symbol>

**<term>** Keyword or phrase which describes a resource.

<bindingDesc> → model.textPhraseLike.limited → <term>

**<title>** Title of a bibliographic entity.

<bindingDesc> → model.textPhraseLike.limited → model.titleLike → <title>

**<watermark>** Contains a description of a watermark or similar device.

<bindingDesc> → model.textPhraseLike.limited → model.msInLine → <watermark>

**<width>** Description of the horizontal size of an object.

<bindingDesc> → model.textPhraseLike.limited → model.dimLike → <width>

## Remarks

The model of this element is based on the [bindingDesc](#) element of the Text Encoding Initiative (TEI).

## <bloc>

Contains the name of a geopolitical unit consisting of two or more nation states or countries.

### Module

[MEI.namesdates](#)

### Attributes

**@analog** (*optional*) Contains a reference to a field or element in another descriptive encoding system to which this MEI element is comparable. Value is plain text.

<bloc> → [att.bibl](#) → @analog

**@auth** (*optional*) A name or label associated with a controlled vocabulary or other authoritative source for this element or its content. Value is plain text.

<bloc> → [att.name](#) → [att.authorized](#) → @auth

**@auth.uri** (*optional*) A web-accessible location of the controlled vocabulary or other authoritative source of identification or definition for this element or its content. This attribute may contain a complete URI or a partial URI which is completed by the value of the codedval attribute. Value conforms to [data.URI](#).  
<bloc> → [att.name](#) → [att.authorized](#) → @auth.uri

**@cert** (*optional*) Signifies the degree of certainty or precision associated with a feature. Value conforms to [data.CERTAINTY](#).

<bloc> → [att.edit](#) → [att.evidence](#) → @cert

**@class** (*optional*) Contains one or more URIs which denote classification terms that apply to the entity bearing this attribute. One or more values from [data.URI](#), separated by spaces.

<bloc> → [att.common](#) → [att.typed](#) → [att.classed](#) → @class

**@codedval** (*optional*) A value that represents or identifies other data. Often, it is a primary key in the database or a unique value in the coded list identified by the auth or auth.uri attributes. One or more values of datatype **NMTOKEN**, separated by spaces.

<bloc> → [att.name](#) → [att.authorized](#) → [att.canonical](#) → @codedval

**@copyof** (*optional*) Points to an element of which the current element is a copy. Value conforms to [data.URI](#).

<bloc> → [att.common](#) → [att.linkin](#) → @copyof

**@corresp** (*optional*) Used to point to other elements that correspond to this one in a generic fashion. One or more values from [data.URI](#), separated by spaces.

<bloc> → [att.common](#) → [att.linkin](#) → @corresp

**@enddate** (*optional*) Contains the end point of a date range in standard ISO form. Value conforms to [data.ISODATE](#).

<bloc> → [att.name](#) → [att.datable](#) → @enddate

**@evidence** (*optional*) Indicates the nature of the evidence supporting the reliability or accuracy of the intervention or interpretation. Allowed values are: "**internal**" (*There is evidence within the document to support the intervention.*), "**external**" (*There is evidence outside the document to support the intervention.*), "**conjecture**" (*The assertion has been made by the editor, cataloguer, or scholar on the basis of their expertise.*)

<bloc> → [att.edit](#) → [att.evidence](#) → @evidence

**@facs** (*optional*) Points to one or more images, portions of an image, or surfaces which correspond to the current element. One or more values from [data.URI](#), separated by spaces.

<bloc> → [att.facsimile](#) → @facs

**@follows** (*optional*) points to one or more events in a user-defined collection that are known to be predecessors of the current element. One or more values from [data.URI](#), separated by spaces.

<bloc> → [att.common](#) → [att.linking](#) → @follows

**@isodate** (*optional*) Provides the value of a textual date in standard ISO form. Value conforms to [data.ISODATE](#).

<bloc> → [att.name](#) → [att.datable](#) → @isodate

**@label** (*optional*) Captures text to be used to generate a label for the element to which it's attached, a "tool tip" or prefatory text, for example. Should not be used to record document content. Value is plain text.

<bloc> → [att.common](#) → [att.labelled](#) → @label

**@n** (*optional*) Provides a number-like designation that indicates an element's position in a sequence of similar elements. May not contain space characters. Value conforms to [data.WORD](#).

<bloc> → [att.common](#) → [att.nNumberLike](#) → @n

**@next** (*optional*) Used to point to the next event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<bloc> → [att.common](#) → [att.linking](#) → @next

**@nonfiling** (*optional*) Holds the number of initial characters (such as those constituting an article or preposition) that should not be used for sorting a title or name. Value is a positive integer.

<bloc> → [att.name](#) → [att.filing](#) → @nonfiling

**@notafter** (*optional*) Contains an upper boundary for an uncertain date in standard ISO form. Value conforms to [data.ISODATE](#).

<bloc> → [att.name](#) → [att.datable](#) → @notafter

**@notbefore** (*optional*) Contains a lower boundary, in standard ISO form, for an uncertain date. Value conforms to [data.ISODATE](#).

<bloc> → [att.name](#) → [att.datable](#) → @notbefore

**@nymref** (*optional*) Used to record a pointer to the regularized form of the name elsewhere in the document. Value conforms to [data.URI](#).

<bloc> → [att.name](#) → @nymref

**@precedes** (*optional*) Points to one or more events in a user-defined collection that are known to be successors of the current element. One or more values from [data.URI](#), separated by spaces.

<bloc> → [att.common](#) → [att.linking](#) → @precedes

**@prev** (*optional*) Points to the previous event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<bloc> → [att.common](#) → [att.linking](#) → @prev

**@resp** (*optional*) Indicates the agent(s) responsible for some aspect of the text's transcription, editing, or encoding. Its value must point to one or more identifiers declared in the document header. One or more values from [data.URI](#), separated by spaces.

<bloc> → [att.common](#) → [att.responsibility](#) → @resp

**@role** (*optional*) Used to specify further information about the entity referenced by this name, for example, the occupation of a person or the status of a place. Value is plain text.

<bloc> → att.name → @role

**@sameas** (*optional*) Points to an element that is the same as the current element but is not a literal copy of the current element. One or more values from [data.URI](#), separated by spaces.

<bloc> → att.common → att.linking → @sameas

**@source** (*optional*) Contains a list of one or more pointers indicating the sources which attest to a given reading. Each value should correspond to the ID of a <source> or <manifestation> element located in the document header. One or more values from [data.URI](#), separated by spaces.

<bloc> → att.edit → att.source → @source

**@startdate** (*optional*) Contains the starting point of a date range in standard ISO form. Value conforms to [data.ISODATE](#).

<bloc> → att.name → att.datable → @startdate

**@synch** (*optional*) Points to elements that are synchronous with the current element. One or more values from [data.URI](#), separated by spaces.

<bloc> → att.common → att.linking → @synch

**@translit** (*optional*) Specifies the transliteration technique used. Value is a [NMTOKEN](#).

<bloc> → att.lang → @translit

**@type** (*optional*) Designation which characterizes the element in some sense, using any convenient classification scheme or typology that employs single-token labels. One or more values of datatype

[NMTOKEN](#), separated by spaces.

<bloc> → att.common → att.type → @type

**@xml:base** (*optional*) Provides a base URI reference with which applications can resolve relative URI references into absolute URI references. Value conforms to [data.URI](#).

<bloc> → att.common → att.basic → @xml:base

**@xml:id** (*optional*) Regularizes the naming of an element and thus facilitates building links between it and other resources. Each id attribute within a document must have a unique value. Value is a valid [xml:id](#).

<bloc> → att.common → att.basic → att.id → @xml:id

**@xml:lang** (*optional*) Identifies the language of the element's content. The values for this attribute are language 'tags' as defined in BCP 47. All language tags that make use of private use sub-tags must be documented in a corresponding language element in the MEI header whose id attribute is the same as the language tag's value. Value is a [language](#).

<bloc> → att.lang → @xml:lang

## Member of

[model.geogNamePart](#) Groups elements which form part of a geographic name.

## Contained By

**<abbr>** A generic element for 1) a shortened form of a word, including an acronym or 2) a shorthand notation.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → model.editTransPart.text → model.editTransPart → <abbr>

**<acquisition>** Records information concerning the process by which an item was acquired by the holding institution.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → <acquisition>

**<actor>** Name of an actor appearing within a cast list.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → <actor>

**<add>** Marks an addition to the text.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → model.editTransPart.text → model.editTransPart → <add>

**<addName>** Contains an additional name component, such as a nickname, epithet, or alias, or any other descriptive phrase used within a personal name.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → model.textPhraseLike → <addName>

**<addrLine>** Single line of a postal address.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → model.textPhraseLike → <addrLine>

**<address>** Contains a postal address, for example of a publisher, an organization, or an individual.

<bloc> → model.geogNamePart → model.addressPart → <address>

**<anchoredText>** Container for text that is fixed to a particular page location, regardless of changes made to the layout of the measures around it.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → <anchoredText>

**<annot>** Provides a statement explaining the text or indicating the basis for an assertion.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → model.textPhraseLike → <annot>

**<arranger>** A person or organization who transcribes a musical composition, usually for a different medium from that of the original; in an arrangement the musical substance remains essentially unchanged.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → <arranger>

**<attacca>** An instruction to begin the next section or movement of a composition without pause.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → <attacca>

**<author>** The name of the creator of the intellectual content of a non-musical, literary work.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → <author>

**<bibl>** Provides a loosely-structured bibliographic citation in which the sub-components may or may not be explicitly marked.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → model.textPhraseLike → <bibl>

**<biblScope>** Defines the scope of a bibliographic reference, for example as a list of page numbers, or a named subdivision of a larger work.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → <biblScope>

**<bindingDesc>** Describes the present and former bindings of an item.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → <bindingDesc>

**<bloc>** Contains the name of a geopolitical unit consisting of two or more nation states or countries.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → model.textPhraseLike → <bloc>

**<bracketSpan>** Marks a sequence of notational events grouped by a bracket.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → <bracketSpan>

**<byline>** Contains the primary statement of responsibility given for a work on its title page.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → <byline>

**<caption>** A label which accompanies an illustration or a table.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → model.textPhraseLike → <caption>

**<composer>** The name of the creator of the intellectual content of a musical work.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → <composer>

**<contentItem>** Contains a single entry within a content description element.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → model.textPhraseLike → <contentItem>

**<contributor>** Names of individuals, institutions, or organizations responsible for contributions to the intellectual content of a work, where the specialized elements for authors, editors, etc. do not suffice or do not apply.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → <contributor>

**<corpName>** Identifies an organization or group of people that acts as a single entity.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → model.textPhraseLike → <corpName>

**<corr>** Contains the correct form of an apparent erroneous passage.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → model.editTransPart.text → model.editTransPart → <corr>

**<country>** Contains the name of a geopolitical unit, such as a nation, country, colony, or commonwealth, larger than or administratively superior to a region and smaller than a bloc.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → model.textPhraseLike → <country>

**<cpMark>** A verbal or graphical indication to copy musical material written elsewhere.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → <cpMark>

**<creation>** Non-bibliographic details of the creation of an intellectual entity, in narrative form, such as the date, place, and circumstances of its composition. More detailed information may be captured within the history element.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → <creation>

**<damage>** Contains an area of damage to the physical medium.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → model.editTransPart.text → model.editTransPart → <damage>

**<date>** A string identifying a point in time or the time period between two such points.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → model.textPhraseLike → <date>

**<decoDesc>** Contains a description of the decoration of an item.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → <decoDesc>

**<decoNote>** Contains a description of one or more decorative features of an item.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → <decoNote>

**<dedicatee>** Entity to whom a creative work is formally offered.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → <dedicatee>

**<dedication>** Contains a dedicatory statement.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → <dedication>

**<del>** Contains information deleted, marked as deleted, or otherwise indicated as superfluous or spurious in the copy text by an author, scribe, annotator, or corrector.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → model.editTransPart.text → model.editTransPart → <del>

**<depth>** Description of a measurement taken through a three-dimensional object.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → <depth>

**<desc>** Container for text that briefly describes the feature to which it is attached, including its intended usage, purpose, or application as appropriate.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → <desc>

**<dim>** Any single dimensional specification.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → <dim>

**<dir>** An instruction expressed as a combination of text and symbols, typically above, below, or between staves, but not on the staff — that is not encoded elsewhere in more specific elements, like **<tempo>**, **<dynam>** or **<repeatMark>**.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → <dir>

**<distributor>** Person or agency, other than a publisher, from which access (including electronic access) to a bibliographic entity may be obtained.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → <distributor>

**<district>** Contains the name of any kind of subdivision of a settlement, such as a parish, ward, or other administrative or geographic unit.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → model.textPhraseLike → <district>

**<dynam>** Indication of the volume of a note, phrase, or section of music.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → <dynam>

**<edition>** A word or text phrase that indicates a difference in either content or form between the item being described and a related item previously issued by the same publisher/distributor (e.g., 2nd edition, version 2.0, etc.), or simultaneously issued by either the same publisher/distributor or another publisher/distributor (e.g., large print edition, British edition, etc.).

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → <edition>

**<editor>** The name of the individual(s), institution(s) or organization(s) acting in an editorial capacity.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → <editor>

**<epigraph>** Contains a quotation, anonymous or attributed, appearing on a title page.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → model.textPhraseLike → model.paraccontentPart → <epigraph>

**<exhibHist>** A record of public exhibitions, including dates, venues, etc.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → <exhibHist>

**<expan>** Contains the expansion of an abbreviation.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → model.editTransPart.text → model.editTransPart → <expan>

**<extent>** Used to express size in terms other than physical dimensions, such as number of pages, records, bytes, physical components, etc.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → <extent>

**<f>** Single element of a figured bass indication.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → <f>

**<famName>** Contains a family (inherited) name, as opposed to a given, baptismal, or nick name.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → model.textPhraseLike → <famName>

**<figDesc>** Contains a brief prose description of the appearance or content of a graphic figure, for use when documenting an image without displaying it.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → <figDesc>

**<fing>** finger – An individual finger in a fingering indication.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → <fing>

**<foreName>** Contains a forename, given or baptismal name.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → model.textPhraseLike → <foreName>

**<funder>** Names of individuals, institutions, or organizations responsible for funding. Funders provide financial support for a project; they are distinct from sponsors, who provide intellectual support and authority.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → <funder>

**<genName>** Contains a name component used to distinguish otherwise similar names on the basis of the relative ages or generations of the persons named.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → model.textPhraseLike → <genName>

**<genre>** Term or terms that designate a category characterizing a particular style, form, or content.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → <genre>

**<geogFeat>** Contains a common noun identifying a geographical feature.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → model.textPhraseLike → <geogFeat>

**<geogName>** The proper noun designation for a place, natural feature, or political jurisdiction.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → model.textPhraseLike → <geogName>

**<gliss>** A continuous or sliding movement from one pitch to another, usually indicated by a straight or wavy line.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → <gliss>

**<hand>** Defines a distinct scribe or handwriting style.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → <hand>

**<harm>** An indication of harmony, e.g., chord names, tablature grids, harmonic analysis, figured bass.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → <harm>

**<head>** Contains any heading, for example, the title of a section of text, or the heading of a list.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → model.textPhraseLike → <head>

**<height>** Description of the vertical size of an object.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → <height>

**<identifier>** An alpha-numeric string that establishes the identity of the described material.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → model.textPhraseLike → <identifier>

**<imprimatur>** Contains a formal statement authorizing the publication of a work, sometimes required to appear on a title page or its verso.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → model.textPhraseLike → model.paracontentPart → <imprimatur>

**<imprint>** Information relating to the publication or distribution of a bibliographic item.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → model.textPhraseLike → <imprint>

**<>>** Contains a single line of text within a line group.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → model.textPhraseLike → <>>

**<label>** A container for document text that identifies the feature to which it is attached. For a "tool tip" or other generated label, use the label attribute.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → <label>

**<labelAbbr>** A label on the pages following the first.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → <labelAbbr>

**<language>** Description of a language used in the document.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → <language>

**<layoutDesc>** Collects layout descriptions.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → <layoutDesc>

**<lem>** (lemma) – Contains the lemma, or base text, of a textual variation.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → model.rdgPart.text → model.rdgPart → <lem>

**<li>** Single item in a <list>.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → model.textPhraseLike → <li>

**<librettist>** Person or organization who is a writer of the text of an opera, oratorio, etc.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → <librettist>

**<line>** A visual line that cannot be represented by a more specific; i.e., semantic, element.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → <line>

**<lyricist>** Person or organization who is a writer of the text of a song.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → <lyricist>

**<metaMark>** A graphical or textual statement with additional / explanatory information about the musical text. The textual consequences of this intervention are encoded independently via other means; that is, with elements such as <add>, <del>, etc.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → <metaMark>

**<name>** Proper noun or noun phrase.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → model.textPhraseLike → <name>

**<nameLink>** Contains a connecting phrase or link used within a name but not regarded as part of it, such as "van der" or "of", "from", etc.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → model.textPhraseLike → <nameLink>

**<num>** Numeric information in any form.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → model.textPhraseLike → <num>

**<octave>** An indication that a passage should be performed one or more octaves above or below its written pitch.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → <octave>

**<orig>** Contains material which is marked as following the original, rather than being normalized or corrected.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → model.editTransPart.text → model.editTransPart → <orig>

**<ornam>** An element indicating an ornament that is not a mordent, turn, or trill.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → <ornam>

**<p>** One or more text phrases that form a logical prose passage.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → model.textPhraseLike → model.paracontentPart → <p>

**<perfRes>** Name of an instrument on which a performer plays, a performer's voice range, or a standard performing ensemble designation.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → <perfRes>

**<periodName>** A label that describes a period of time, such as 'Baroque' or '3rd Style period'.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → model.textPhraseLike → <periodName>

**<persName>** Designation for an individual, including any or all of that individual's forenames, surnames, honorific titles, and added names.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → model.textPhraseLike → <persName>

**<pgFoot>** A running footer.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → <pgFoot>

**<pgHead>** A running header.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → <pgHead>

**<price>** The cost of access to a bibliographic item.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → <price>

**<provenance>** The record of ownership or custodianship of an item.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → <provenance>

**<pubPlace>** Name of the place where a bibliographic item was published.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → <pubPlace>

**<publisher>** Name of the organization responsible for the publication of a bibliographic item.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → <publisher>

**<q>** Contains material which is distinguished from the surrounding phrase-level text using quotation marks or a similar method. Use <quote> for block-level quotations.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → model.textPhraseLike → <q>

**<quote>** Contains a paragraph-like block of text attributed to an external source, normally set off from the surrounding text by spacing or other typographic distinction.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → model.textPhraseLike → model.paracontentPart → <quote>

**<rdg>** (reading) – Contains a single reading within a textual variation.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → model.rdgPart.text → model.rdgPart → <rdg>

**<recipient>** The name of the individual(s), institution(s) or organization(s) receiving correspondence.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → <recipient>

**<ref>** Defines a traversible reference to another location. May contain text and sub-elements that describe the destination.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → model.textPhraseLike → <ref>

**<reg>** Contains material which has been regularized or normalized in some sense.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → model.editTransPart.text → model.editTransPart → <reg>

**<region>** Contains the name of an administrative unit such as a state, province, or county, larger than a settlement, but smaller than a country.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → model.textPhraseLike → <region>

**<rend>** A formatting element indicating special visual rendering, e.g., bold or italicized, of a text word or phrase.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → model.textPhraseLike → <rend>

**<repeatMark>** An instruction expressed as a combination of text and symbols – segno and coda – typically above, below, or between staves, but not on the staff.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → <repeatMark>

**<repository>** Institution, agency, or individual which holds a bibliographic item.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → <repository>

**<resp>** A phrase describing the nature of intellectual responsibility.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → <resp>

**<restore>** Indicates restoration of material to an earlier state by cancellation of an editorial or authorial marking or instruction.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → model.editTransPart.text → model.editTransPart → <restore>

**<role>** Name of a dramatic role, as given in a cast list.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → <role>

**<roleDesc>** Describes a character's role in a drama.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → <roleDesc>

**<roleName>** Contains a name component which indicates that the referent has a particular role or position in society, such as an official title or rank.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → model.textPhraseLike → <roleName>

**<scriptDesc>** Contains a description of the letters or characters used in an autographic item.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → <scriptDesc>

**<seal>** A single seal or similar attachment.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → <seal>

**<sealDesc>** Describes the seals or similar external attachments applied to an item.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → <sealDesc>

**<seg>** (arbitrary segment) represents any segmentation of text below the "text component" level.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → model.textPhraseLike → <seg>

**<settlement>** Contains the name of a settlement such as a city, town, or village identified as a single geopolitical or administrative unit.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → model.textPhraseLike → <settlement>

**<sic>** Contains apparently incorrect or inaccurate material.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → model.editTransPart.text → model.editTransPart → <sic>

**<signifLet>** Significative letter(s).

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → <signifLet>

**<soundChan>** Reflects the number of apparent sound channels in the playback of a recording (monaural, stereophonic, quadraphonic, etc.).

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → <soundChan>

**<speaker>** Contains a specialized form of heading or label, giving the name of one or more speakers in a dramatic text or fragment.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → <speaker>

**<sponsor>** Names of sponsoring individuals, organizations or institutions. Sponsors give their intellectual authority to a project; they are to be distinguished from funders, who provide the funding but do not necessarily take intellectual responsibility.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → <sponsor>

**<stack>** An inline table with a single column.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → <stack>

**<stageDir>** Contains any kind of stage direction within a dramatic text or fragment.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → <stageDir>

**<street>** full street address including any name or number identifying a building as well as the name of the street or route on which it is located.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → model.textPhraseLike → <street>

**<styleName>** A label for a characteristic style of writing or performance, such as 'bebop' or 'rock-n-roll'.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → model.textPhraseLike → <styleName>

**<supplied>** Contains material supplied by the transcriber or editor for any reason.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → model.editTransPart.text → model.editTransPart → <supplied>

**<supportDesc>** Groups elements describing the physical support material of an item.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → <supportDesc>

**<syl>** Individual lyric syllable.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → <syl>

**<td>** Designates a table cell that contains data as opposed to a cell that contains column or row heading information.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → model.textPhraseLike → <td>

**<tempo>** Text and symbols descriptive of tempo, mood, or style, e.g., "allarg.", "a tempo", "cantabile", "Moderato", "J=60", "Moderato J =60").

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → <tempo>

**<term>** Keyword or phrase which describes a resource.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → <term>

**<textLang>** Identifies the languages and writing systems within the work described by a bibliographic description, not the language of the description.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → <textLang>

**<th>** Designates a table cell containing column or row heading information as opposed to one containing data.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → model.textPhraseLike → <th>

**<treatHist>** A record of the treatment the item has undergone (e.g., de-acidification, restoration, etc.).

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → <treatHist>

**<treatSched>** Scheduled treatment, e.g., de-acidification, restoration, etc., for an item.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → <treatSched>

**<typeDesc>** Contains a description of the typefaces or other aspects of the printing of a printed source.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → <typeDesc>

**<unclear>** Contains material that cannot be transcribed with certainty because it is illegible or inaudible in the source.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → model.editTransPart.text → model.editTransPart → <unclear>

**<width>** Description of the horizontal size of an object.

<bloc> → model.geogNamePart → model.addressPart → model.textPhraseLike.limited → <width>

## May Contain

**<abbr>** A generic element for 1) a shortened form of a word, including an acronym or 2) a shorthand notation.

<bloc> → model.textPhraseLike → model.textPhraseLike.limited → model.editorialLike → <abbr>

**<add>** Marks an addition to the text.

<bloc> → model.transcriptionLike → <add>

**<address>** Contains a postal address, for example of a publisher, an organization, or an individual.

<bloc> → model.textPhraseLike → model.textPhraseLike.limited → model.addressLike → <address>

**<annot>** Provides a statement explaining the text or indicating the basis for an assertion.

<bloc> → model.textPhraseLike → model.textPhraseLike.limited → model.annotLike → <annot>

**<bibl>** Provides a loosely-structured bibliographic citation in which the sub-components may or may not be explicitly marked.

<bloc> → model.textPhraseLike → model.textPhraseLike.limited → model.biblLike → <bibl>

**<biblStruct>** Contains a bibliographic citation in which bibliographic sub-elements must appear in a specified order.

<bloc> → model.textPhraseLike → model.textPhraseLike.limited → model.biblLike → <biblStruct>

**<bloc>** Contains the name of a geopolitical unit consisting of two or more nation states or countries.

<bloc> → model.textPhraseLike → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <bloc>

**<catchwords>** Describes the system used to ensure correct ordering of the quires making up an item, typically by means of annotations at the foot of the page.

<bloc> → model.textPhraseLike → model.textPhraseLike.limited → model.mslinline → <catchwords>

**<choice>** Groups a number of alternative encodings for the same point in a text.

<bloc> → model.editLike → <choice>

**<corpName>** Identifies an organization or group of people that acts as a single entity.

<bloc> → model.textPhraseLike → model.textPhraseLike.limited → model.nameLike → model.nameLike.agent → <corpName>

**<corr>** Contains the correct form of an apparent erroneous passage.

<bloc> → model.transcriptionLike → <corr>

**<country>** Contains the name of a geopolitical unit, such as a nation, country, colony, or commonwealth, larger than or administratively superior to a region and smaller than a bloc.

<bloc> → model.textPhraseLike → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <country>

**<damage>** Contains an area of damage to the physical medium.

<bloc> → model.transcriptionLike → <damage>

**<date>** A string identifying a point in time or the time period between two such points.

<bloc> → model.textPhraseLike → model.textPhraseLike.limited → model.dateLike → <date>

**<dedicatee>** Entity to whom a creative work is formally offered.

<bloc> → model.textPhraseLike → model.textPhraseLike.limited → <dedicatee>

**<del>** Contains information deleted, marked as deleted, or otherwise indicated as superfluous or spurious in the copy text by an author, scribe, annotator, or corrector.

<bloc> → model.transcriptionLike → <del>

**<depth>** Description of a measurement taken through a three-dimensional object.

<bloc> → model.textPhraseLike → model.textPhraseLike.limited → model.dimLike → <depth>

**<dim>** Any single dimensional specification.

<bloc> → model.textPhraseLike → model.textPhraseLike.limited → model.dimLike → <dim>

**<dimensions>** Information about the physical size of an entity; usually includes numerical data.

<bloc> → model.textPhraseLike → model.textPhraseLike.limited → <dimensions>

**<district>** Contains the name of any kind of subdivision of a settlement, such as a parish, ward, or other administrative or geographic unit.

<bloc> → model.textPhraseLike → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <district>

**<expan>** Contains the expansion of an abbreviation.

<bloc> → model.textPhraseLike → model.textPhraseLike.limited → model.editorialLike → <expan>

**<extent>** Used to express size in terms other than physical dimensions, such as number of pages, records, bytes, physical components, etc.

<bloc> → model.textPhraseLike → model.textPhraseLike.limited → <extent>

**<fig>** Groups elements representing or containing graphic information such as an illustration or figure.

<bloc> → model.textPhraseLike → model.textPhraseLike.limited → model.figureLike → <fig>

**<gap>** Indicates a point where material has been omitted in a transcription, whether as part of sampling practice or for editorial reasons described in the MEI header.

<bloc> → model.transcriptionLike → <gap>

**<geogFeat>** Contains a common noun identifying a geographical feature.

<bloc> → model.textPhraseLike → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <geogFeat>

**<geogName>** The proper noun designation for a place, natural feature, or political jurisdiction.

<bloc> → model.textPhraseLike → model.textPhraseLike.limited → model.nameLike → model.nameLike.place → model.nameLike.geogName → <geogName>

**<handShift>** Marks the beginning of a passage written in a new hand, or of a change in the scribe, writing style, ink or character of the document hand.

<bloc> → model.transcriptionLike → <handShift>

**<height>** Description of the vertical size of an object.

<bloc> → model.textPhraseLike → model.textPhraseLike.limited → model.dimLike → <height>

**<heraldry>** Contains a heraldic formula or phrase, typically found as part of a blazon, coat of arms, etc.

<bloc> → model.textPhraseLike → model.textPhraseLike.limited → model.msInline → <heraldry>

**<identifier>** An alpha-numeric string that establishes the identity of the described material.

<bloc> → model.textPhraseLike → model.textPhraseLike.limited → model.identifierLike → <identifier>

**<lb>** An empty formatting element that forces text to begin on a new line.

<bloc> → model.textPhraseLike → model.textPhraseLike.limited → model.lbLike → <lb>

**<locus>** Defines a location within a manuscript or manuscript component, usually as a (possibly discontinuous) sequence of folio references.

<bloc> → model.textPhraseLike → model.textPhraseLike.limited → model.msInline → <locus>

**<locusGrp>** Groups locations which together form a distinct but discontinuous item within a manuscript or manuscript part, according to a specific foliation.

<bloc> → model.textPhraseLike → model.textPhraseLike.limited → model.msInline → <locusGrp>

**<name>** Proper noun or noun phrase.

<bloc> → model.textPhraseLike → model.textPhraseLike.limited → model.nameLike → <name>

**<num>** Numeric information in any form.

<bloc> → model.textPhraseLike → model.textPhraseLike.limited → model.measurementLike → model.numLike → <num>

**<orig>** Contains material which is marked as following the original, rather than being normalized or corrected.

<bloc> → model.transcriptionLike → <orig>

**<pb>** An empty formatting element that forces text to begin on a new page.

<bloc> → model.textPhraseLike → model.pbLike → <pb>

**<periodName>** A label that describes a period of time, such as 'Baroque' or '3rd Style period'.

<bloc> → model.textPhraseLike → model.textPhraseLike.limited → model.nameLike.label → <periodName>

**<persName>** Designation for an individual, including any or all of that individual's forenames, surnames, honorific titles, and added names.

<bloc> → model.textPhraseLike → model.textPhraseLike.limited → model.nameLike → model.nameLike.agent → <persName>

**<postBox>** (postal box or post office box) contains a number or other identifier for some postal delivery point other than a street address.

<bloc> → model.textPhraseLike → model.textPhraseLike.limited → model.addressPart → <postBox>

**<postCode>** (postal code) contains a numerical or alphanumeric code used as part of a postal address to simplify sorting or delivery of mail.

<bloc> → model.textPhraseLike → model.textPhraseLike.limited → model.addressPart → <postCode>

**<ptr>** Defines a traversible pointer to another location, using only attributes to describe the destination.

<bloc> → model.textPhraseLike → model.textPhraseLike.limited → model.locrefLike → <ptr>

**<q>** Contains material which is distinguished from the surrounding phrase-level text using quotation marks or a similar method. Use <quote> for block-level quotations.

<bloc> → model.textPhraseLike → model.textPhraseLike.limited → model.qLike → <q>

**<ref>** Defines a traversible reference to another location. May contain text and sub-elements that describe the destination.

<bloc> → model.textPhraseLike → model.textPhraseLike.limited → model.locrefLike → <ref>

**<reg>** Contains material which has been regularized or normalized in some sense.

<bloc> → model.transcriptionLike → <reg>

**<region>** Contains the name of an administrative unit such as a state, province, or county, larger than a settlement, but smaller than a country.

<bloc> → model.textPhraseLike → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <region>

**<relation>** Describes a relationship or linkage amongst entities.

<bloc> → model.textPhraseLike → model.textPhraseLike.limited → model.relationLike → <relation>

**<relationList>** Gathers relation elements.

<bloc> → model.textPhraseLike → model.textPhraseLike.limited → model.relationLike → <relationList>

**<rend>** A formatting element indicating special visual rendering, e.g., bold or italicized, of a text word or phrase.

<bloc> → model.textPhraseLike → model.textPhraseLike.limited → model.rendLike → <rend>

**<repository>** Institution, agency, or individual which holds a bibliographic item.

<bloc> → model.textPhraseLike → model.textPhraseLike.limited → model.nameLike → model.nameLike.place → model.repositoryLike → <repository>

**<restore>** Indicates restoration of material to an earlier state by cancellation of an editorial or authorial marking or instruction.

<bloc> → model.transcriptionLike → <restore>

**<secFolio>** Marks the word or words taken from a fixed point in a codex (typically the beginning of the second leaf) in order to provide a unique identifier for the item.

<bloc> → model.textPhraseLike → model.textPhraseLike.limited → model.mslinline → <secFolio>

**<seg>** (arbitrary segment) represents any segmentation of text below the "text component" level.

<bloc> → model.textPhraseLike → model.textPhraseLike.limited → <seg>

**<settlement>** Contains the name of a settlement such as a city, town, or village identified as a single geopolitical or administrative unit.

<bloc> → model.textPhraseLike → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <settlement>

**<sic>** Contains apparently incorrect or inaccurate material.

<bloc> → model.transcriptionLike → <sic>

**<signatures>** Provides a description of the leaf or quire signatures found within a codex.

<bloc> → model.textPhraseLike → model.textPhraseLike.limited → model.mslinline → <signatures>

**<stack>** An inline table with a single column.

<bloc> → model.textPhraseLike → model.textPhraseLike.limited → model.rendLike → <stack>

**<stamp>** Contains a word or phrase describing an official mark indicating ownership, genuineness, validity, etc.

<bloc> → model.textPhraseLike → model.textPhraseLike.limited → model.mslinline → <stamp>

**<street>** full street address including any name or number identifying a building as well as the name of the street or route on which it is located.

<bloc> → model.textPhraseLike → model.textPhraseLike.limited → model.addressPart → <street>

**<styleName>** A label for a characteristic style of writing or performance, such as 'bebop' or 'rock-n-roll'.

<bloc> → model.textPhraseLike → model.textPhraseLike.limited → model.nameLike.label → <styleName>

**<subst>** Groups transcriptional elements when the combination is to be regarded as a single intervention in the text.

<bloc> → model.editLike → <subst>

**<supplied>** Contains material supplied by the transcriber or editor for any reason.

<bloc> → model.transcriptionLike → <supplied>

**<symbol>** A reference to a previously defined symbol.

<bloc> → model.textPhraseLike → model.textPhraseLike.limited → <symbol>

**<term>** Keyword or phrase which describes a resource.

<bloc> → model.textPhraseLike → model.textPhraseLike.limited → <term>

**<title>** Title of a bibliographic entity.

<bloc> → model.textPhraseLike → model.textPhraseLike.limited → model.titleLike → <title>

**<unclear>** Contains material that cannot be transcribed with certainty because it is illegible or inaudible in the source.

<bloc> → model.transcriptionLike → <unclear>

**<watermark>** Contains a description of a watermark or similar device.

<bloc> → model.textPhraseLike → model.textPhraseLike.limited → model.mslinline → <watermark>

**<width>** Description of the horizontal size of an object.

<bloc> → model.textPhraseLike → model.textPhraseLike.limited → model.dimLike → <width>

## Remarks

The model of this element is based on the **bloc** element of the Text Encoding Initiative (TEI).

## Declaration

```

## <body>

Contains the whole of a single musical text, excluding any front or back matter.

### Referenced in chapters

[2.1.2 General Music Structure Elements](#), [2.1.2.1 Divisions of the Body](#), [12.2.1 Overview](#)

### Module

[MEI.shared](#)

### Attributes

**@class (optional)** Contains one or more URIs which denote classification terms that apply to the entity bearing this attribute. One or more values from [data.URI](#), separated by spaces.

<body> → [att.common](#) → [att.typed](#) → [att.classed](#) → @class

**@copyof (optional)** Points to an element of which the current element is a copy. Value conforms to [data.URI](#).

<body> → [att.common](#) → [att.linkin](#) → @copyof

**@corresp (optional)** Used to point to other elements that correspond to this one in a generic fashion. One or more values from [data.URI](#), separated by spaces.

<body> → [att.common](#) → [att.linkin](#) → @corresp

**@decls (optional)** Identifies one or more metadata elements (other than classification terms) within the header, which are understood to apply to the element bearing this attribute and its content. One or more values from [data.URI](#), separated by spaces.

<body> → [att.metadataPointing](#) → @decls

**@follows (optional)** points to one or more events in a user-defined collection that are known to be predecessors of the current element. One or more values from [data.URI](#), separated by spaces.

<body> → [att.common](#) → [att.linkin](#) → @follows

**@label (optional)** Captures text to be used to generate a label for the element to which it's attached, a "tool tip" or prefatory text, for example. Should not be used to record document content. Value is plain text.

<body> → [att.common](#) → [att.labelled](#) → @label

**@n (optional)** Provides a number-like designation that indicates an element's position in a sequence of similar elements. May not contain space characters. Value conforms to [data.WORD](#).

<body> → [att.common](#) → [att.nNumberLike](#) → @n

**@next (optional)** Used to point to the next event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<body> → [att.common](#) → [att.linkin](#) → @next

**@precedes (optional)** Points to one or more events in a user-defined collection that are known to be successors of the current element. One or more values from [data.URI](#), separated by spaces.

<body> → [att.common](#) → [att.linkin](#) → @precedes

**@prev (optional)** Points to the previous event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<body> → [att.common](#) → [att.linkin](#) → @prev

**@resp** (*optional*) Indicates the agent(s) responsible for some aspect of the text's transcription, editing, or encoding. Its value must point to one or more identifiers declared in the document header. One or more values from [data.URI](#), separated by spaces.

<body> → [att.common](#) → [att.responsibility](#) → @resp

**@sameas** (*optional*) Points to an element that is the same as the current element but is not a literal copy of the current element. One or more values from [data.URI](#), separated by spaces.

<body> → [att.common](#) → [att.linking](#) → @sameas

**@synch** (*optional*) Points to elements that are synchronous with the current element. One or more values from [data.URI](#), separated by spaces.

<body> → [att.common](#) → [att.linking](#) → @synch

**@type** (*optional*) Designation which characterizes the element in some sense, using any convenient classification scheme or typology that employs single-token labels. One or more values of datatype **NMTOKEN**, separated by spaces.

<body> → [att.common](#) → [att.typed](#) → @type

**@xml:base** (*optional*) Provides a base URI reference with which applications can resolve relative URI references into absolute URI references. Value conforms to [data.URI](#).

<body> → [att.common](#) → [att.basic](#) → @xml:base

**@xml:id** (*optional*) Regularizes the naming of an element and thus facilitates building links between it and other resources. Each id attribute within a document must have a unique value. Value is a valid [xml:id](#).

<body> → [att.common](#) → [att.basic](#) → [att.id](#) → @xml:id

## Member of

(body isn't member of any model class)

## Contained By

### May Contain

**<div>** Major structural division of text, such as a preface, chapter or section.

<body> → [model.divLike](#) → <div>

**<mdiv>** Contains a subdivision of the body of a musical text.

<body> → [model.mdivLike](#) → <mdiv>

## Remarks

When the music can be broken into high-level, discrete, linear segments, such as movements of a symphony, there may be multiple [<mdiv>](#) elements within [<body>](#). This is the highest level indication of the structure of the music.

The content model of [<body>](#) also allows blocks of text and music notation to be interleaved. This permits the encoding of a wide range of musical documents, including those that are primarily textual with only occasional musical material or even those which completely lack music notation.

## Declaration

## <bracketSpan>

Marks a sequence of notational events grouped by a bracket.

### Module

MEI.cmn

### Attributes

**@altsym** (*optional*) Provides a way of pointing to a user-defined symbol. It must contain a reference to an ID of a <symbolDef> element elsewhere in the document. Value conforms to [data.URI](#).

<bracketSpan> → att.bracketSpan.vis → att.altSym → @altsym

**@class** (*optional*) Contains one or more URLs which denote classification terms that apply to the entity bearing this attribute. One or more values from [data.URI](#), separated by spaces.

<bracketSpan> → att.common → att.typed → att.classed → @class

**@color** (*optional*) Used to indicate visual appearance. Do not confuse this with the musical term 'color' as used in pre-CMN notation. Value conforms to [data.COLOR](#).

<bracketSpan> → att.bracketSpan.vis → att.color → @color

**@copyof** (*optional*) Points to an element of which the current element is a copy. Value conforms to [data.URI](#).

<bracketSpan> → att.common → att.linkin → @copyof

**@corresp** (*optional*) Used to point to other elements that correspond to this one in a generic fashion. One or more values from [data.URI](#), separated by spaces.

<bracketSpan> → att.common → att.linkin → @corresp

**@dots.ges** (*optional*) Number of dots required for a gestural duration when different from that of the written duration. Value conforms to [data.AUGMENTDOT](#).

<bracketSpan> → att.bracketSpan.ges → att.duration.ges → @dots.ges

**@dur** (*optional*) When a duration cannot be represented as a single power-of-two value, multiple space-separated values that add up to the total duration may be used. One or more values from [data.DURATION](#), separated by spaces.

<bracketSpan> → att.bracketSpan.log → att.duration.additive → @dur

**@dur.ges** (*optional*) Records performed duration information that differs from the written duration. Value conforms to [data.DURATION.GESTURAL](#).

<bracketSpan> → att.bracketSpan.ges → att.duration.ges → @dur.ges

**@dur.metrical** (*optional*) Duration as a count of units provided in the time signature denominator. Value is a decimal number.

<bracketSpan> → att.bracketSpan.ges → att.duration.ges → @dur.metrical

**@dur.ppq** (*optional*) Duration recorded as pulses-per-quarter note, e.g., MIDI clicks or MusicXML divisions. Value is a positive integer, including 0.

<bracketSpan> → att.bracketSpan.ges → att.duration.ges → @dur.ppq

**@dur.real** (*optional*) Duration in seconds, e.g., 1.732. Value is a decimal number.

<bracketSpan> → att.bracketSpan.ges → att.duration.ges → @dur.real

**@dur.recip** (*optional*) Duration as an optionally dotted Humdrum [\\*\\*recip value](#). Value is a [token](#).

<bracketSpan> → att.bracketSpan.ges → att.duration.ges → @dur.recip

**@endho** (*optional*) Records the horizontal adjustment of a feature's programmatically-determined end point. Value conforms to [data.MEASUREMENTSIGNED](#).

<bracketSpan> → att.bracketSpan.vis → att.visualOffset2 → att.visualOffset2.ho → @endho

**@endid** (*optional*) Indicates the final element in a sequence of events to which the feature applies. Value conforms to [data.URI](#).

<bracketSpan> → att.bracketSpan.log → att.startEndId → @endid

**@endto** (*optional*) Records a timestamp adjustment of a feature's programmatically-determined end point. Value conforms to [data.TSTAMPOFFSET](#).

<bracketSpan> → att.bracketSpan.vis → att.visualOffset2 → att.visualOffset2.to → @endto

**@endvo** (*optional*) Records a vertical adjustment of a feature's programmatically-determined end point. Value conforms to [data.MEASUREMENTSIGNED](#).

<bracketSpan> → att.bracketSpan.vis → att.visualOffset2 → att.visualOffset2.vo → @endvo

**@evaluate** (*optional*) Specifies the intended meaning when a participant in a relationship is itself a pointer. Allowed values are: "**all**" (*If an element pointed to is itself a pointer, then the target of that pointer will be taken, and so on, until an element is found which is not a pointer.*), "**one**" (*If an element pointed to is itself a pointer, then its target (whether a pointer or not) is taken as the target of this pointer.*), "**none**" (*No further evaluation of targets is carried out beyond that needed to find the element(s) specified in plist or target attribute.*)

<bracketSpan> → att.bracketSpan.log → att.controlEvent → att.targetEval → @evaluate

**@facis** (*optional*) Points to one or more images, portions of an image, or surfaces which correspond to the current element. One or more values from [data.URI](#), separated by spaces.

<bracketSpan> → att.facsimile → @facis

**@follows** (*optional*) points to one or more events in a user-defined collection that are known to be predecessors of the current element. One or more values from [data.URI](#), separated by spaces.

<bracketSpan> → att.common → att.linkin → @follows

**@fontfam** (*optional*) Contains the name of a font-family. Value conforms to [data.FONTFAMILY](#).

<bracketSpan> → att.bracketSpan.vis → att.typography → @fontfam

**@fontname** (*optional*) Holds the name of a font. Value conforms to [data.FONTNAME](#).

<bracketSpan> → att.bracketSpan.vis → att.typography → @fontname

**@fontsize** (*optional*) Indicates the size of a font expressed in printers' points, i.e., 1/72nd of an inch, relative terms, e.g., small, larger, etc., or percentage values relative to normal size, e.g., 125%. Value conforms to [data.FONTSIZE](#).

<bracketSpan> → att.bracketSpan.vis → att.typography → @fontsize

**@fontstyle** (*optional*) Records the style of a font, i.e., italic, oblique, or normal. Value conforms to [data.FONTSTYLE](#).

<bracketSpan> → att.bracketSpan.vis → att.typography → @fontstyle

**@fontweight** (*optional*) Used to indicate bold type. Value conforms to [data.FONTWEIGHT](#).

<bracketSpan> → att.bracketSpan.vis → att.typography → @fontweight

**@func** (*required*) Describes the function of the bracketed event sequence. Allowed values are:

"**coloration**" (*Represents coloration in the mensural notation source material.*), "**cross-rhythm**" (*Marks a sequence which does not match the current meter.*), "**ligature**" (*Represents a ligature in the mensural notation source material.*)

<bracketSpan> → att.bracketSpan.log → @func

**@glyph.auth** (*optional*) A name or label associated with the controlled vocabulary from which the value of `glyph.name` or `glyph.num` is taken, or the textual content of the element. Allowed values are: "smufl" (*Standard Music Font Layout*.)

<bracketSpan> → att.bracketSpan.vis → att.extSym → att.extSym.auth → @glyph.auth

**@glyph.name** (*optional*) Glyph name. Value is plain text.

<bracketSpan> → att.bracketSpan.vis → att.extSym → att.extSym.names → @glyph.name

**@glyph.num** (*optional*) Numeric glyph reference in hexadecimal notation, e.g., "#xE000" or "U+E000".

N.B. SMuFL version 1.18 uses the range U+E000 - U+ECBF. Value conforms to [data.HEXNUM](#).

<bracketSpan> → att.bracketSpan.vis → att.extSym → att.extSym.names → @glyph.num

**@glyph.uri** (*optional*) The web-accessible location of the controlled vocabulary from which the value of `glyph.name` or `glyph.num` is taken, or the textual content of the element. Value conforms to [data.URI](#).

<bracketSpan> → att.bracketSpan.vis → att.extSym → att.extSym.auth → @glyph.uri

**@ho** (*optional*) Records a horizontal adjustment to a feature's programmatically-determined location in terms of staff interline distance; that is, in units of 1/2 the distance between adjacent staff lines. Value conforms to [data.MEASUREMENTSIGNED](#).

<bracketSpan> → att.bracketSpan.vis → att.visualOffset → att.visualOffset.ho → @ho

**@label** (*optional*) Captures text to be used to generate a label for the element to which it's attached, a "tool tip" or prefatory text, for example. Should not be used to record document content. Value is plain text.

<bracketSpan> → att.common → att.labelled → @label

**@layer** (*optional*) Identifies the layer to which a feature applies. One or more values of datatype **positiveInteger**, separated by spaces.

<bracketSpan> → att.bracketSpan.log → att.controlEvent → att.layerIdent → @layer

**@lendsym** (*optional*) Symbol rendered at end of line. Value conforms to [data.LINESTARTENDSYMBOL](#).

<bracketSpan> → att.bracketSpan.vis → att.lineRend → @lendsym

**@lendsym.size** (*optional*) Holds the relative size of the line-end symbol. Value conforms to [data.FONTSCALE](#).

<bracketSpan> → att.bracketSpan.vis → att.lineRend → @lendsym.size

**@letterspacing** (*optional*) Indicates letter spacing (aka tracking) in analogy to the CSS letter-spacing property. Value conforms to [data.MEASUREMENTTYPOGRAPHYSIGNED](#).

<bracketSpan> → att.bracketSpan.vis → att.typography → @letterspacing

**@lform** (*optional*) Describes the line style of a line. Value conforms to [data.LINEFORM](#).

<bracketSpan> → att.bracketSpan.vis → att.lineRend → att.lineRend.base → @lform

**@lineheight** (*optional*) Indicates line height in analogy to the CSS line-height property. Value conforms to either [data.MEASUREMENTTYPOGRAPHYUNSIGNED](#) or [data.PERCENT](#).

<bracketSpan> → att.bracketSpan.vis → att.typography → @lineheight

**@lsegs** (*optional*) Describes the number of segments into which a dashed or dotted line may be divided, or the number of "peaks" of a wavy line; a pair of space-separated values (minimum and maximum, respectively) provides a range between which a rendering system-supplied value may fall, while a single value indicates a fixed amount of space; that is, the minimum and maximum values are equal. One or two values of datatype **a positive integer no smaller than 2**, separated by a space.

<bracketSpan> → att.bracketSpan.vis → att.lineRend → att.lineRend.base → @lsegs

**@lstartsym** (*optional*) Symbol rendered at start of line. Value conforms to [data.LINESTARTENDSYMBOL](#).

<bracketSpan> → att.bracketSpan.vis → att.lineRend → @lstartsym

**@lstartsym.size** (*optional*) Holds the relative size of the line-start symbol. Value conforms to [data.FONTSCALE](#).

<bracketSpan> → att.bracketSpan.vis → att.lineRend → @lstartsym.size

**@lwidth** (*optional*) Width of a line. Value conforms to [data.LINEWIDTH](#).

<bracketSpan> → att.bracketSpan.vis → att.lineRend → att.lineRend.base → @lwidth

**@n** (*optional*) Provides a number-like designation that indicates an element's position in a sequence of similar elements. May not contain space characters. Value conforms to [data.WORD](#).

<bracketSpan> → att.common → att.nNumberLike → @n

**@next** (*optional*) Used to point to the next event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<bracketSpan> → att.common → att.linking → @next

**@part** (*optional*) Indicates the part in which the current feature should appear. Use '%all' when the feature should occur in every part. One or more values of datatype **a string matching the following regular expression: "(%all|#[\i][\c]+)"**, separated by spaces.

<bracketSpan> → att.bracketSpan.log → att.controlEvent → att.partIdent → @part

**@partstaff** (*optional*) Signifies the part staff on which a notated feature occurs. Use '%all' when the feature should occur on every staff. One or more values of datatype **a string matching the following regular expression: "(%all|\d+(-\d+)?)"**, separated by spaces.

<bracketSpan> → att.bracketSpan.log → att.controlEvent → att.partIdent → @partstaff

**@plist** (*optional*) When the target attribute is present, plist identifies the active participants; that is, those entities pointed "from", in a relationship with the specified target(s). When the target attribute is not present, it identifies participants in a mutual relationship. One or more values from [data.URI](#), separated by spaces.

<bracketSpan> → att.bracketSpan.log → att.controlEvent → att.plist → @plist

**@precedes** (*optional*) Points to one or more events in a user-defined collection that are known to be successors of the current element. One or more values from [data.URI](#), separated by spaces.

<bracketSpan> → att.common → att.linking → @precedes

**@prev** (*optional*) Points to the previous event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<bracketSpan> → att.common → att.linking → @prev

**@resp** (*optional*) Indicates the agent(s) responsible for some aspect of the text's transcription, editing, or encoding. Its value must point to one or more identifiers declared in the document header. One or more values from [data.URI](#), separated by spaces.

<bracketSpan> → att.common → att.responsibility → @resp

**@sameas** (*optional*) Points to an element that is the same as the current element but is not a literal copy of the current element. One or more values from [data.URI](#), separated by spaces.

<bracketSpan> → att.common → att.linking → @sameas

**@staff** (*recommended*) Signifies the staff on which a notated event occurs or to which a control event applies. Mandatory when applicable. One or more values of datatype **positiveInteger**, separated by spaces.

<bracketSpan> → att.bracketSpan.log → att.controlEvent → att.staffId → @staff

**@startho** (*optional*) Records the horizontal adjustment of a feature's programmatically-determined start point. Value conforms to [data.MEASUREMENTSIGNED](#).

<bracketSpan> → att.bracketSpan.vis → att.visualOffset2 → att.visualOffset2.ho → @startho

**@startid** (*optional*) Holds a reference to the first element in a sequence of events to which the feature applies. Value conforms to [data.URI](#).

<bracketSpan> → att.bracketSpan.log → att.startEndId → att.startId → @startid

**@startto** (*optional*) Records a timestamp adjustment of a feature's programmatically-determined start point. Value conforms to [data.TSTAMPOFFSET](#).

<bracketSpan> → att.bracketSpan.vis → att.visualOffset2 → att.visualOffset2.to → @startto

**@startvo** (*optional*) Records a vertical adjustment of a feature's programmatically-determined start point. Value conforms to [data.MEASUREMENTSIGNED](#).

<bracketSpan> → att.bracketSpan.vis → att.visualOffset2 → att.visualOffset2.vo → @startvo

**@synch** (*optional*) Points to elements that are synchronous with the current element. One or more values from [data.URI](#), separated by spaces.

<bracketSpan> → att.common → att.linkin → @synch

**@to** (*optional*) Records a timestamp adjustment of a feature's programmatically-determined location in terms of musical time; that is, beats. Value conforms to [data.TSTAMPOFFSET](#).

<bracketSpan> → att.bracketSpan.vis → att.visualOffset → att.visualOffset.to → @to

**@tstamp** (*optional*) Encodes the onset time in terms of musical time, i.e., beats[.fractional beat part], as expressed in the written time signature. Value conforms to [data.BEAT](#).

<bracketSpan> → att.bracketSpan.log → att.controlEvent → att.timestamp.log → @tstamp

**@tstamp.ges** (*optional*) Encodes the onset time in terms of musical time, i.e., beats[.fractional beat part], as expressed in the written time signature. Value conforms to [data.BEAT](#).

<bracketSpan> → att.bracketSpan.log → att.controlEvent → att.timestamp.ges → @tstamp.ges

**@tstamp.real** (*optional*) Records the onset time in terms of ISO time. Value conforms to [data.ISOTIME](#).

<bracketSpan> → att.bracketSpan.log → att.controlEvent → att.timestamp.ges → @tstamp.real

**@tstamp2** (*optional*) Encodes the ending point of an event, i.e., a count of measures plus a beat location in the ending measure. Value conforms to [data.MEASUREBEAT](#).

<bracketSpan> → att.bracketSpan.log → att.timestamp2.log → @tstamp2

**@tstamp2.ges** (*optional*) Encodes the ending point of an event, i.e., a count of measures plus a beat location in the ending measure. Value conforms to [data.MEASUREBEAT](#).

<bracketSpan> → att.bracketSpan.ges → att.timestamp2.ges → @tstamp2.ges

**@tstamp2.real** (*optional*) Records the ending point of an event in terms of ISO time. Value conforms to [data.ISOTIME](#).

<bracketSpan> → att.bracketSpan.ges → att.timestamp2.ges → @tstamp2.real

**@type** (*optional*) Designation which characterizes the element in some sense, using any convenient classification scheme or typology that employs single-token labels. One or more values of datatype **NMTOKEN**, separated by spaces.

<bracketSpan> → att.common → att.typed → @type

**@vo** (*optional*) Records the vertical adjustment of a feature's programmatically-determined location in terms of staff interline distance; that is, in units of 1/2 the distance between adjacent staff lines. Value conforms to [data.MEASUREMENTSIGNED](#).

<bracketSpan> → att.bracketSpan.vis → att.visualOffset → att.visualOffset.vo → @vo

**@when** (*optional*) Indicates the point of occurrence of this feature along a time line. Its value must be the ID of a <when> element elsewhere in the document. Value conforms to [data.URI](#).

<bracketSpan> → att.bracketSpan.log → att.controlEvent → att.alignment → @when

**@x** (*optional*) Encodes an x coordinate for a feature in an output coordinate system. When it is necessary to record the placement of a feature in a facsimile image, use the facets attribute. Value is a decimal number.

<bracketSpan> → att.bracketSpan.vis → att.xy → @x

**@x2** (*optional*) Encodes the optional 2nd x coordinate. Value is a decimal number.

<bracketSpan> → att.bracketSpan.vis → att.xy2 → @x2

**@xml:base** (*optional*) Provides a base URI reference with which applications can resolve relative URI references into absolute URI references. Value conforms to [data.URI](#).

<bracketSpan> → att.common → att.basic → @xml:base

**@xml:id** (*optional*) Regularizes the naming of an element and thus facilitates building links between it and other resources. Each id attribute within a document must have a unique value. Value is a valid [xml:id](#).

<bracketSpan> → att.common → att.basic → att.id → @xml:id

**@y** (*optional*) Encodes a y coordinate for a feature in an output coordinate system. When it is necessary to record the placement of a feature in a facsimile image, use the facets attribute. Value is a decimal number.

<bracketSpan> → att.bracketSpan.vis → att.xy → @y

**@y2** (*optional*) Encodes the optional 2nd y coordinate. Value is a decimal number.

<bracketSpan> → att.bracketSpan.vis → att.xy2 → @y2

## Member of

[model.controlEventLike.cmn](#) Groups control events that appear in CMN.

## Contained By

**<abbr>** A generic element for 1) a shortened form of a word, including an acronym or 2) a shorthand notation.

<bracketSpan> → [model.controlEventLike.cmn](#) → [model.editTransPart.music](#) → [model.editTransPart](#) → <abbr>

**<add>** Marks an addition to the text.

<bracketSpan> → [model.controlEventLike.cmn](#) → [model.editTransPart.music](#) → [model.editTransPart](#) → <add>

**<corr>** Contains the correct form of an apparent erroneous passage.

<bracketSpan> → [model.controlEventLike.cmn](#) → [model.editTransPart.music](#) → [model.editTransPart](#) → <corr>

**<damage>** Contains an area of damage to the physical medium.

<bracketSpan> → [model.controlEventLike.cmn](#) → [model.editTransPart.music](#) → [model.editTransPart](#) → <damage>

**<del>** Contains information deleted, marked as deleted, or otherwise indicated as superfluous or spurious in the copy text by an author, scribe, annotator, or corrector.

<bracketSpan> → [model.controlEventLike.cmn](#) → [model.editTransPart.music](#) → [model.editTransPart](#) → <del>

**<expan>** Contains the expansion of an abbreviation.

<bracketSpan> → model.controlEventLike.cmn → model.editTransPart.music → model.editTransPart → <expan>

**<lem>** (lemma) – Contains the lemma, or base text, of a textual variation.

<bracketSpan> → model.controlEventLike.cmn → model.rdgPart.music → model.rdgPart → <lem>

**<measure>** Unit of musical time consisting of a fixed number of note values of a given type, as determined by the prevailing meter, and delimited in musical notation by bar lines.

<bracketSpan> → model.controlEventLike.cmn → model.measurePart → <measure>

**<orig>** Contains material which is marked as following the original, rather than being normalized or corrected.

<bracketSpan> → model.controlEventLike.cmn → model.editTransPart.music → model.editTransPart → <orig>

**<rdg>** (reading) – Contains a single reading within a textual variation.

<bracketSpan> → model.controlEventLike.cmn → model.rdgPart.music → model.rdgPart → <rdg>

**<reg>** Contains material which has been regularized or normalized in some sense.

<bracketSpan> → model.controlEventLike.cmn → model.editTransPart.music → model.editTransPart → <reg>

**<restore>** Indicates restoration of material to an earlier state by cancellation of an editorial or authorial marking or instruction.

<bracketSpan> → model.controlEventLike.cmn → model.editTransPart.music → model.editTransPart → <restore>

**<sic>** Contains apparently incorrect or inaccurate material.

<bracketSpan> → model.controlEventLike.cmn → model.editTransPart.music → model.editTransPart → <sic>

**<supplied>** Contains material supplied by the transcriber or editor for any reason.

<bracketSpan> → model.controlEventLike.cmn → model.editTransPart.music → model.editTransPart → <supplied>

**<unclear>** Contains material that cannot be transcribed with certainty because it is illegible or inaudible in the source.

<bracketSpan> → model.controlEventLike.cmn → model.editTransPart.music → model.editTransPart → <unclear>

## May Contain

**<abbr>** A generic element for 1) a shortened form of a word, including an acronym or 2) a shorthand notation.

<bracketSpan> → model.textPhraseLike.limited → model.editorialLike → <abbr>

**<address>** Contains a postal address, for example of a publisher, an organization, or an individual.

<bracketSpan> → model.textPhraseLike.limited → model.addressLike → <address>

**<annot>** Provides a statement explaining the text or indicating the basis for an assertion.

<bracketSpan> → model.textPhraseLike.limited → model.annotLike → <annot>

**<bibl>** Provides a loosely-structured bibliographic citation in which the sub-components may or may not be explicitly marked.

<bracketSpan> → model.textPhraseLike.limited → model.biblLike → <bibl>

**<biblStruct>** Contains a bibliographic citation in which bibliographic sub-elements must appear in a specified order.

<bracketSpan> → model.textPhraseLike.limited → model.biblLike → <biblStruct>

**<bloc>** Contains the name of a geopolitical unit consisting of two or more nation states or countries.

<bracketSpan> → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <bloc>

**<catchwords>** Describes the system used to ensure correct ordering of the quires making up an item, typically by means of annotations at the foot of the page.

<bracketSpan> → model.textPhraseLike.limited → model.msInline → <catchwords>

**<corpName>** Identifies an organization or group of people that acts as a single entity.

<bracketSpan> → model.textPhraseLike.limited → model.nameLike → model.nameLike.agent → <corpName>

**<country>** Contains the name of a geopolitical unit, such as a nation, country, colony, or commonwealth, larger than or administratively superior to a region and smaller than a bloc.

<bracketSpan> → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <country>

**<date>** A string identifying a point in time or the time period between two such points.

<bracketSpan> → model.textPhraseLike.limited → model.dateLike → <date>

**<dedictee>** Entity to whom a creative work is formally offered.

<bracketSpan> → model.textPhraseLike.limited → <dedictee>

**<depth>** Description of a measurement taken through a three-dimensional object.

<bracketSpan> → model.textPhraseLike.limited → model.dimLike → <depth>

**<dim>** Any single dimensional specification.

<bracketSpan> → model.textPhraseLike.limited → model.dimLike → <dim>

**<dimensions>** Information about the physical size of an entity; usually includes numerical data.

<bracketSpan> → model.textPhraseLike.limited → <dimensions>

**<district>** Contains the name of any kind of subdivision of a settlement, such as a parish, ward, or other administrative or geographic unit.

<bracketSpan> → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <district>

**<expan>** Contains the expansion of an abbreviation.

<bracketSpan> → model.textPhraseLike.limited → model.editorialLike → <expan>

**<extent>** Used to express size in terms other than physical dimensions, such as number of pages, records, bytes, physical components, etc.

<bracketSpan> → model.textPhraseLike.limited → <extent>

**<fig>** Groups elements representing or containing graphic information such as an illustration or figure.

<bracketSpan> → model.textPhraseLike.limited → model.figureLike → <fig>

**<geogFeat>** Contains a common noun identifying a geographical feature.

<bracketSpan> → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <geogFeat>

**<geogName>** The proper noun designation for a place, natural feature, or political jurisdiction.

<bracketSpan> → model.textPhraseLike.limited → model.nameLike → model.nameLike.place → model.nameLike.geogName → <geogName>

**<height>** Description of the vertical size of an object.

<bracketSpan> → model.textPhraseLike.limited → model.dimLike → <height>

**<heraldry>** Contains a heraldic formula or phrase, typically found as part of a blazon, coat of arms, etc.

<bracketSpan> → model.textPhraseLike.limited → model.msInline → <heraldry>

**<identifier>** An alpha-numeric string that establishes the identity of the described material.

<bracketSpan> → model.textPhraseLike.limited → model.identifierLike → <identifier>

**<lb>** An empty formatting element that forces text to begin on a new line.

<bracketSpan> → model.textPhraseLike.limited → model.lbLike → <lb>

**<locus>** Defines a location within a manuscript or manuscript component, usually as a (possibly discontinuous) sequence of folio references.

<bracketSpan> → model.textPhraseLike.limited → model.msInline → <locus>

**<locusGrp>** Groups locations which together form a distinct but discontinuous item within a manuscript or manuscript part, according to a specific foliation.

<bracketSpan> → model.textPhraseLike.limited → model.msInline → <locusGrp>

**<name>** Proper noun or noun phrase.

<bracketSpan> → model.textPhraseLike.limited → model.nameLike → <name>

**<num>** Numeric information in any form.

<bracketSpan> → model.textPhraseLike.limited → model.measurementLike → model.numLike → <num>

**<periodName>** A label that describes a period of time, such as 'Baroque' or '3rd Style period'.

<bracketSpan> → model.textPhraseLike.limited → model.nameLike.label → <periodName>

**<persName>** Designation for an individual, including any or all of that individual's forenames, surnames, honorific titles, and added names.

<bracketSpan> → model.textPhraseLike.limited → model.nameLike → model.nameLike.agent → <persName>

**<postBox>** (postal box or post office box) contains a number or other identifier for some postal delivery point other than a street address.

<bracketSpan> → model.textPhraseLike.limited → model.addressPart → <postBox>

**<postCode>** (postal code) contains a numerical or alphanumeric code used as part of a postal address to simplify sorting or delivery of mail.

<bracketSpan> → model.textPhraseLike.limited → model.addressPart → <postCode>

**<ptr>** Defines a traversible pointer to another location, using only attributes to describe the destination.

<bracketSpan> → model.textPhraseLike.limited → model.locrefLike → <ptr>

**<q>** Contains material which is distinguished from the surrounding phrase-level text using quotation marks or a similar method. Use **<quote>** for block-level quotations.

<bracketSpan> → model.textPhraseLike.limited → model.qLike → <q>

**<ref>** Defines a traversible reference to another location. May contain text and sub-elements that describe the destination.

<bracketSpan> → model.textPhraseLike.limited → model.locrefLike → <ref>

**<region>** Contains the name of an administrative unit such as a state, province, or county, larger than a settlement, but smaller than a country.

<bracketSpan> → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <region>

**<relation>** Describes a relationship or linkage amongst entities.

<bracketSpan> → model.textPhraseLike.limited → model.relationLike → <relation>

**<relationList>** Gathers relation elements.

<bracketSpan> → model.textPhraseLike.limited → model.relationLike → <relationList>

**<rend>** A formatting element indicating special visual rendering, e.g., bold or italicized, of a text word or phrase.

<bracketSpan> → model.textPhraseLike.limited → model.rendLike → <rend>

**<repository>** Institution, agency, or individual which holds a bibliographic item.

<bracketSpan> → model.textPhraseLike.limited → model.nameLike → model.nameLike.place → model.repositoryLike → <repository>

**<secFolio>** Marks the word or words taken from a fixed point in a codex (typically the beginning of the second leaf) in order to provide a unique identifier for the item.

<bracketSpan> → model.textPhraseLike.limited → model.msInline → <secFolio>

**<seg>** (arbitrary segment) represents any segmentation of text below the "text component" level.

<bracketSpan> → model.textPhraseLike.limited → <seg>

**<settlement>** Contains the name of a settlement such as a city, town, or village identified as a single geopolitical or administrative unit.

<bracketSpan> → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <settlement>

**<signatures>** Provides a description of the leaf or quire signatures found within a codex.

<bracketSpan> → model.textPhraseLike.limited → model.msInline → <signatures>

**<stack>** An inline table with a single column.

<bracketSpan> → model.textPhraseLike.limited → model.rendLike → <stack>

**<stamp>** Contains a word or phrase describing an official mark indicating ownership, genuineness, validity, etc.

<bracketSpan> → model.textPhraseLike.limited → model.msInline → <stamp>

**<street>** full street address including any name or number identifying a building as well as the name of the street or route on which it is located.

<bracketSpan> → model.textPhraseLike.limited → model.addressPart → <street>

**<styleName>** A label for a characteristic style of writing or performance, such as 'bebop' or 'rock-n-roll'.

<bracketSpan> → model.textPhraseLike.limited → model.nameLike.label → <styleName>

**<symbol>** A reference to a previously defined symbol.

<bracketSpan> → model.textPhraseLike.limited → <symbol>

**<term>** Keyword or phrase which describes a resource.

<bracketSpan> → model.textPhraseLike.limited → <term>

**<title>** Title of a bibliographic entity.

<bracketSpan> → model.textPhraseLike.limited → model.titleLike → <title>

**<watermark>** Contains a description of a watermark or similar device.

<bracketSpan> → model.textPhraseLike.limited → model.msInline → <watermark>

**<width>** Description of the horizontal size of an object.

<bracketSpan> → model.textPhraseLike.limited → model.dimLike → <width>

## Remarks

Text that interrupts the bracket used to mark the event group may be captured as the content of <bracketSpan>. The starting point of the group/bracket may be indicated by either a startid, tstamp, tstamp.ges, or tstamp.real attribute, while the ending point may be recorded by either a dur, dur.ges, endid, or tstamp2 attribute. It is a semantic error not to specify one starting and one ending type of attribute.

## Constraints

Must have one of the attributes: startid, tstamp, tstamp.ges or tstamp.real.

Must have one of the attributes: dur, dur.ges, endid, or tstamp2.

## Declaration

```

## <breath>

(breath mark) – An indication of a point at which the performer on an instrument requiring breath (including the voice) may breathe.

### Referenced in chapters

[4.3.6.1 Breath Marks](#)

### Module

[MEI.cmn](#)

### Attributes

**@altsym** (*optional*) Provides a way of pointing to a user-defined symbol. It must contain a reference to an ID of a [<symbolDef>](#) element elsewhere in the document. Value conforms to [data.URI](#).

<breath> → [att.breath.vis](#) → [att.altSym](#) → @altsym

**@class** (*optional*) Contains one or more URIs which denote classification terms that apply to the entity bearing this attribute. One or more values from [data.URI](#), separated by spaces.

<breath> → [att.common](#) → [att.typed](#) → [att.classed](#) → @class

**@color** (*optional*) Used to indicate visual appearance. Do not confuse this with the musical term 'color' as used in pre-CMN notation. Value conforms to [data.COLOR](#).

<breath> → [att.breath.vis](#) → [att.color](#) → @color

**@copyof** (*optional*) Points to an element of which the current element is a copy. Value conforms to [data.URI](#).

<breath> → [att.common](#) → [att.linkin](#) → @copyof

**@corresp** (*optional*) Used to point to other elements that correspond to this one in a generic fashion. One or more values from [data.URI](#), separated by spaces.

<breath> → [att.common](#) → [att.linkin](#) → @corresp

**@facs** (*optional*) Points to one or more images, portions of an image, or surfaces which correspond to the current element. One or more values from [data.URI](#), separated by spaces.

<breath> → [att.facsimile](#) → @facs

**@follows** (*optional*) points to one or more events in a user-defined collection that are known to be predecessors of the current element. One or more values from [data.URI](#), separated by spaces.

<breath> → [att.common](#) → [att.linkin](#) → @follows

**@fontfam** (*optional*) Contains the name of a font-family. Value conforms to [data.FONTFAMILY](#).

<breath> → [att.breath.vis](#) → [att.typography](#) → @fontfam

**@fontname** (*optional*) Holds the name of a font. Value conforms to [data.FONTNAME](#).

<breath> → [att.breath.vis](#) → [att.typography](#) → @fontname

**@fontsize** (*optional*) Indicates the size of a font expressed in printers' points, i.e., 1/72nd of an inch, relative terms, e.g., small, larger, etc., or percentage values relative to normal size, e.g., 125%. Value conforms to [data.FONTSIZE](#).

<breath> → [att.breath.vis](#) → [att.typography](#) → @fontsize

**@fontstyle** (*optional*) Records the style of a font, i.e., italic, oblique, or normal. Value conforms to [data.FONTSTYLE](#).

<breath> → att.breath.vis → att.typography → @fontstyle

**@fontweight** (*optional*) Used to indicate bold type. Value conforms to [data.FONTWEIGHT](#).

<breath> → att.breath.vis → att.typography → @fontweight

**@glyph.auth** (*optional*) A name or label associated with the controlled vocabulary from which the value of `glyph.name` or `glyph.num` is taken, or the textual content of the element. Allowed values are: "**smufl**" (*Standard Music Font Layout*.)

<breath> → att.breath.vis → att.extSym → att.extSym.auth → @glyph.auth

**@glyph.name** (*optional*) Glyph name. Value is plain text.

<breath> → att.breath.vis → att.extSym → att.extSym.names → @glyph.name

**@glyph.num** (*optional*) Numeric glyph reference in hexadecimal notation, e.g., "#xE000" or "U+E000".

N.B. SMuFL version 1.18 uses the range U+E000 - U+ECBF. Value conforms to [data.HEXNUM](#).

<breath> → att.breath.vis → att.extSym → att.extSym.names → @glyph.num

**@glyph.uri** (*optional*) The web-accessible location of the controlled vocabulary from which the value of `glyph.name` or `glyph.num` is taken, or the textual content of the element. Value conforms to [data.URI](#).

<breath> → att.breath.vis → att.extSym → att.extSym.auth → @glyph.uri

**@ho** (*optional*) Records a horizontal adjustment to a feature's programmatically-determined location in terms of staff interline distance; that is, in units of 1/2 the distance between adjacent staff lines. Value conforms to [data.MEASUREMENTSIGNED](#).

<breath> → att.breath.vis → att.visualOffset → att.visualOffset.ho → @ho

**@label** (*optional*) Captures text to be used to generate a label for the element to which it's attached, a "tool tip" or prefatory text, for example. Should not be used to record document content. Value is plain text.

<breath> → att.common → att.labelled → @label

**@layer** (*optional*) Identifies the layer to which a feature applies. One or more values of datatype **positiveInteger**, separated by spaces.

<breath> → att.breath.log → att.layerIdent → @layer

**@letterspacing** (*optional*) Indicates letter spacing (aka tracking) in analogy to the CSS letter-spacing property. Value conforms to [data.MEASUREMENTTYPOGRAPHYSIGNED](#).

<breath> → att.breath.vis → att.typography → @letterspacing

**@lineheight** (*optional*) Indicates line height in analogy to the CSS line-height property. Value conforms to either [data.MEASUREMENTTYPOGRAPHYUNSIGNED](#) or [data.PERCENT](#).

<breath> → att.breath.vis → att.typography → @lineheight

**@loc** (*optional*) Holds the staff location of the feature. Value conforms to [data.STAFFLOC](#).

<breath> → att.breath.vis → att.staffLoc → @loc

**@n** (*optional*) Provides a number-like designation that indicates an element's position in a sequence of similar elements. May not contain space characters. Value conforms to [data.WORD](#).

<breath> → att.common → att.nNumberLike → @n

**@next** (*optional*) Used to point to the next event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<breath> → att.common → att.linked → @next

**@oloc** (*optional*) Records staff location in terms of written octave. Value conforms to [data.OCTAVE](#).

<breath> → att.breath.vis → att.staffLoc.pitched → @oloc

**@part** (*optional*) Indicates the part in which the current feature should appear. Use '%all' when the feature should occur in every part. One or more values of datatype **a string matching the following regular expression: "(%all|#[\i][\c]+)"**, separated by spaces.

<breath> → att.breath.log → att.partIdent → @part

**@partstaff** (*optional*) Signifies the part staff on which a notated feature occurs. Use '%all' when the feature should occur on every staff. One or more values of datatype **a string matching the following regular expression: "(%all|\d+(-\d+)?)"**, separated by spaces.

<breath> → att.breath.log → att.partIdent → @partstaff

**@place** (*optional*) Captures the placement of the item with respect to the staff with which it is associated. Value conforms to [data.STAFFREL](#).

<breath> → att.breath.vis → att.placementRelStaff → @place

**@ploc** (*optional*) Captures staff location in terms of written pitch name. Value conforms to [data.PITCHNAME](#).

<breath> → att.breath.vis → att.staffLoc.pitched → @ploc

**@precedes** (*optional*) Points to one or more events in a user-defined collection that are known to be successors of the current element. One or more values from [data.URI](#), separated by spaces.

<breath> → att.common → att.linked → @precedes

**@prev** (*optional*) Points to the previous event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<breath> → att.common → att.linked → @prev

**@resp** (*optional*) Indicates the agent(s) responsible for some aspect of the text's transcription, editing, or encoding. Its value must point to one or more identifiers declared in the document header. One or more values from [data.URI](#), separated by spaces.

<breath> → att.common → att.responsibility → @resp

**@sameas** (*optional*) Points to an element that is the same as the current element but is not a literal copy of the current element. One or more values from [data.URI](#), separated by spaces.

<breath> → att.common → att.linked → @sameas

**@staff** (*recommended*) Signifies the staff on which a notated event occurs or to which a control event applies. Mandatory when applicable. One or more values of datatype **positiveInteger**, separated by spaces.

<breath> → att.breath.log → att.staffIdent → @staff

**@startid** (*optional*) Holds a reference to the first element in a sequence of events to which the feature applies. Value conforms to [data.URI](#).

<breath> → att.breath.log → att.startId → @startid

**@synch** (*optional*) Points to elements that are synchronous with the current element. One or more values from [data.URI](#), separated by spaces.

<breath> → att.common → att.linked → @synch

**@to** (*optional*) Records a timestamp adjustment of a feature's programmatically-determined location in terms of musical time; that is, beats. Value conforms to [data.TSTAMPOFFSET](#).

<breath> → att.breath.vis → att.visualOffset → att.visualOffset.to → @to

**@tstamp** (*optional*) Encodes the onset time in terms of musical time, i.e., beats[.fractional beat part], as expressed in the written time signature. Value conforms to [data.BEAT](#).

<breath> → att.breath.log → att.timestamp.log → @tstamp

**@tstamp.ges** (*optional*) Encodes the onset time in terms of musical time, i.e., beats[.fractional beat part], as expressed in the written time signature. Value conforms to [data.BEAT](#).

<breath> → att.breath.ges → att.timestamp.ges → @tstamp.ges

**@tstamp.real** (*optional*) Records the onset time in terms of ISO time. Value conforms to [data.ISOTIME](#).

<breath> → att.breath.ges → att.timestamp.ges → @tstamp.real

**@type** (*optional*) Designation which characterizes the element in some sense, using any convenient classification scheme or typology that employs single-token labels. One or more values of datatype **NMTOKEN**, separated by spaces.

<breath> → att.common → att.type → @type

**@vo** (*optional*) Records the vertical adjustment of a feature's programmatically-determined location in terms of staff interline distance; that is, in units of 1/2 the distance between adjacent staff lines. Value conforms to [data.MEASUREMENTSIGNED](#).

<breath> → att.breath.vis → att.visualOffset → att.visualOffset.vo → @vo

**@when** (*optional*) Indicates the point of occurrence of this feature along a time line. Its value must be the ID of a [<when>](#) element elsewhere in the document. Value conforms to [data.URI](#).

<breath> → att.breath.log → att.alignment → @when

**@x** (*optional*) Encodes an x coordinate for a feature in an output coordinate system. When it is necessary to record the placement of a feature in a facsimile image, use the `facs` attribute. Value is a decimal number.

<breath> → att.breath.vis → att.xy → @x

**@xml:base** (*optional*) Provides a base URI reference with which applications can resolve relative URI references into absolute URI references. Value conforms to [data.URI](#).

<breath> → att.common → att.basic → @xml:base

**@xml:id** (*optional*) Regularizes the naming of an element and thus facilitates building links between it and other resources. Each `id` attribute within a document must have a unique value. Value is a valid [xml:id](#).

<breath> → att.common → att.basic → att.id → @xml:id

**@y** (*optional*) Encodes a y coordinate for a feature in an output coordinate system. When it is necessary to record the placement of a feature in a facsimile image, use the `facs` attribute. Value is a decimal number.

<breath> → att.breath.vis → att.xy → @y

## Member of

[model.controlEventLike.cmn](#) Groups control events that appear in CMN.

## Contained By

**<abbr>** A generic element for 1) a shortened form of a word, including an acronym or 2) a shorthand notation.

<breath> → [model.controlEventLike.cmn](#) → [model.editTransPart.music](#) → [model.editTransPart](#) → <abbr>

**<add>** Marks an addition to the text.

<breath> → [model.controlEventLike.cmn](#) → [model.editTransPart.music](#) → [model.editTransPart](#) → <add>

**<corr>** Contains the correct form of an apparent erroneous passage.

<breath> → model.controlEventLike.cmn → model.editTransPart.music → model.editTransPart → <corr>

**<damage>** Contains an area of damage to the physical medium.

<breath> → model.controlEventLike.cmn → model.editTransPart.music → model.editTransPart → <damage>

**<del>** Contains information deleted, marked as deleted, or otherwise indicated as superfluous or spurious in the copy text by an author, scribe, annotator, or corrector.

<breath> → model.controlEventLike.cmn → model.editTransPart.music → model.editTransPart → <del>

**<expan>** Contains the expansion of an abbreviation.

<breath> → model.controlEventLike.cmn → model.editTransPart.music → model.editTransPart → <expan>

**<lem>** (lemma) – Contains the lemma, or base text, of a textual variation.

<breath> → model.controlEventLike.cmn → model.rdgPart.music → model.rdgPart → <lem>

**<measure>** Unit of musical time consisting of a fixed number of note values of a given type, as determined by the prevailing meter, and delimited in musical notation by bar lines.

<breath> → model.controlEventLike.cmn → model.measurePart → <measure>

**<orig>** Contains material which is marked as following the original, rather than being normalized or corrected.

<breath> → model.controlEventLike.cmn → model.editTransPart.music → model.editTransPart → <orig>

**<rdg>** (reading) – Contains a single reading within a textual variation.

<breath> → model.controlEventLike.cmn → model.rdgPart.music → model.rdgPart → <rdg>

**<reg>** Contains material which has been regularized or normalized in some sense.

<breath> → model.controlEventLike.cmn → model.editTransPart.music → model.editTransPart → <reg>

**<restore>** Indicates restoration of material to an earlier state by cancellation of an editorial or authorial marking or instruction.

<breath> → model.controlEventLike.cmn → model.editTransPart.music → model.editTransPart → <restore>

**<sic>** Contains apparently incorrect or inaccurate material.

<breath> → model.controlEventLike.cmn → model.editTransPart.music → model.editTransPart → <sic>

**<supplied>** Contains material supplied by the transcriber or editor for any reason.

<breath> → model.controlEventLike.cmn → model.editTransPart.music → model.editTransPart → <supplied>

**<unclear>** Contains material that cannot be transcribed with certainty because it is illegible or inaudible in the source.

<breath> → model.controlEventLike.cmn → model.editTransPart.music → model.editTransPart → <unclear>

## May Contain

– (<breath> may not have child elements)

## Remarks

This element may also indicate a short pause or break for instruments \*not\* requiring breath. In such cases, it functions as a guide to phrasing. The starting point of the breath mark may be indicated by either a startid, tstamp, tstamp.ges, or tstamp.real attribute. It is a semantic error not to specify a starting point attribute.

Since the breath mark does not disrupt the normal tempo of a performance, it has no directly encodeable duration.

The default value for place for a breath mark is "above". Unless indicated by other attributes, a breath mark will be rendered as a comma-like symbol above the top line of the staff.

## Constraints

Must have one of the attributes: startid, tstamp, tstamp.ges or tstamp.real.

## Declaration

```

DEVELOPMENT  
VERSION

## <byline>

Contains the primary statement of responsibility given for a work on its title page.

### Module

[MEI.header](#)

### Attributes

**@analog** (*optional*) Contains a reference to a field or element in another descriptive encoding system to which this MEI element is comparable. Value is plain text.

<byline> → [att.bibl](#) → @analog

**@class** (*optional*) Contains one or more URIs which denote classification terms that apply to the entity bearing this attribute. One or more values from [data.URI](#), separated by spaces.

<byline> → [att.common](#) → [att.typed](#) → [att.classed](#) → @class

**@copyof** (*optional*) Points to an element of which the current element is a copy. Value conforms to [data.URI](#).

<byline> → [att.common](#) → [att.linkin](#) → @copyof

**@corresp** (*optional*) Used to point to other elements that correspond to this one in a generic fashion. One or more values from [data.URI](#), separated by spaces.

<byline> → [att.common](#) → [att.linkin](#) → @corresp

**@facsimile** (*optional*) Points to one or more images, portions of an image, or surfaces which correspond to the current element. One or more values from [data.URI](#), separated by spaces.

<byline> → [att.facsimile](#) → @facsimile

**@follows** (*optional*) points to one or more events in a user-defined collection that are known to be predecessors of the current element. One or more values from [data.URI](#), separated by spaces.

<byline> → [att.common](#) → [att.linkin](#) → @follows

**@label** (*optional*) Captures text to be used to generate a label for the element to which it's attached, a "tool tip" or prefatory text, for example. Should not be used to record document content. Value is plain text.

<byline> → [att.common](#) → [att.labelled](#) → @label

**@n** (*optional*) Provides a number-like designation that indicates an element's position in a sequence of similar elements. May not contain space characters. Value conforms to [data.WORD](#).

<byline> → [att.common](#) → [att.nNumberLike](#) → @n

**@next** (*optional*) Used to point to the next event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<byline> → [att.common](#) → [att.linkin](#) → @next

**@precedes** (*optional*) Points to one or more events in a user-defined collection that are known to be successors of the current element. One or more values from [data.URI](#), separated by spaces.

<byline> → [att.common](#) → [att.linkin](#) → @precedes

**@prev** (*optional*) Points to the previous event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<byline> → [att.common](#) → [att.linkin](#) → @prev

**@resp** (*optional*) Indicates the agent(s) responsible for some aspect of the text's transcription, editing, or encoding. Its value must point to one or more identifiers declared in the document header. One or more values from [data.URI](#), separated by spaces.

<byline> → [att.common](#) → [att.responsibility](#) → @resp

**@sameas** (*optional*) Points to an element that is the same as the current element but is not a literal copy of the current element. One or more values from [data.URI](#), separated by spaces.

<byline> → [att.common](#) → [att.linking](#) → @sameas

**@synch** (*optional*) Points to elements that are synchronous with the current element. One or more values from [data.URI](#), separated by spaces.

<byline> → [att.common](#) → [att.linking](#) → @synch

**@translit** (*optional*) Specifies the transliteration technique used. Value is a [NMOKEN](#).

<byline> → [att.common](#) → [att.lang](#) → @translit

**@type** (*optional*) Designation which characterizes the element in some sense, using any convenient classification scheme or typology that employs single-token labels. One or more values of datatype [NMOKEN](#), separated by spaces.

<byline> → [att.common](#) → [att.typed](#) → @type

**@xml:base** (*optional*) Provides a base URI reference with which applications can resolve relative URI references into absolute URI references. Value conforms to [data.URI](#).

<byline> → [att.common](#) → [att.basic](#) → @xml:base

**@xml:id** (*optional*) Regularizes the naming of an element and thus facilitates building links between it and other resources. Each id attribute within a document must have a unique value. Value is a valid [xml:id](#).

<byline> → [att.common](#) → [att.basic](#) → [att.id](#) → @xml:id

**@xml:lang** (*optional*) Identifies the language of the element's content. The values for this attribute are language 'tags' as defined in BCP 47. All language tags that make use of private use sub-tags must be documented in a corresponding language element in the MEI header whose id attribute is the same as the language tag's value. Value is a [language](#).

<byline> → [att.lang](#) → @xml:lang

## Member of

[model.titlePagePart](#) Groups elements that may appear as part of a title page transcription.

## Contained By

**<titlePage>** Contains a transcription of the title page of a text.

<byline> → [model.titlePagePart](#) → <titlePage>

## May Contain

**<abbr>** A generic element for 1) a shortened form of a word, including an acronym or 2) a shorthand notation.

<byline> → [model.textPhraseLike.limited](#) → [model.editorialLike](#) → <abbr>

**<address>** Contains a postal address, for example of a publisher, an organization, or an individual.

<byline> → [model.textPhraseLike.limited](#) → [model.addressLike](#) → <address>

**<annot>** Provides a statement explaining the text or indicating the basis for an assertion.

<byline> → model.textPhraseLike.limited → model.annotLike → <annot>

**<arranger>** A person or organization who transcribes a musical composition, usually for a different medium from that of the original; in an arrangement the musical substance remains essentially unchanged.

<byline> → model.respLikePart → <arranger>

**<author>** The name of the creator of the intellectual content of a non-musical, literary work.

<byline> → model.respLikePart → <author>

**<bibl>** Provides a loosely-structured bibliographic citation in which the sub-components may or may not be explicitly marked.

<byline> → model.textPhraseLike.limited → model.biblLike → <bibl>

**<biblStruct>** Contains a bibliographic citation in which bibliographic sub-elements must appear in a specified order.

<byline> → model.textPhraseLike.limited → model.biblLike → <biblStruct>

**<bloc>** Contains the name of a geopolitical unit consisting of two or more nation states or countries.

<byline> → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <bloc>

**<catchwords>** Describes the system used to ensure correct ordering of the quires making up an item, typically by means of annotations at the foot of the page.

<byline> → model.textPhraseLike.limited → model.msInline → <catchwords>

**<composer>** The name of the creator of the intellectual content of a musical work.

<byline> → model.respLikePart → <composer>

**<contributor>** Names of individuals, institutions, or organizations responsible for contributions to the intellectual content of a work, where the specialized elements for authors, editors, etc. do not suffice or do not apply.

<byline> → model.respLikePart → <contributor>

**<corpName>** Identifies an organization or group of people that acts as a single entity.

<byline> → model.textPhraseLike.limited → model.nameLike → model.nameLike.agent → <corpName>

**<country>** Contains the name of a geopolitical unit, such as a nation, country, colony, or commonwealth, larger than or administratively superior to a region and smaller than a bloc.

<byline> → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <country>

**<date>** A string identifying a point in time or the time period between two such points.

<byline> → model.textPhraseLike.limited → model.dateLike → <date>

**<dedic平ee>** Entity to whom a creative work is formally offered.

<byline> → model.textPhraseLike.limited → <dedic平ee>

**<depth>** Description of a measurement taken through a three-dimensional object.

<byline> → model.textPhraseLike.limited → model.dimLike → <depth>

**<dim>** Any single dimensional specification.

<byline> → model.textPhraseLike.limited → model.dimLike → <dim>

**<dimensions>** Information about the physical size of an entity; usually includes numerical data.

<byline> → model.textPhraseLike.limited → <dimensions>

**<district>** Contains the name of any kind of subdivision of a settlement, such as a parish, ward, or other administrative or geographic unit.

<byline> → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <district>

**<editor>** The name of the individual(s), institution(s) or organization(s) acting in an editorial capacity.

<byline> → model.respLikePart → <editor>

**<expan>** Contains the expansion of an abbreviation.

<byline> → model.textPhraseLike.limited → model.editorialLike → <expan>

**<extent>** Used to express size in terms other than physical dimensions, such as number of pages, records, bytes, physical components, etc.

<byline> → model.textPhraseLike.limited → <extent>

**<fig>** Groups elements representing or containing graphic information such as an illustration or figure.

<byline> → model.textPhraseLike.limited → model.figureLike → <fig>

**<funder>** Names of individuals, institutions, or organizations responsible for funding. Funders provide financial support for a project; they are distinct from sponsors, who provide intellectual support and authority.

<byline> → model.respLikePart → <funder>

**<geogFeat>** Contains a common noun identifying a geographical feature.

<byline> → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <geogFeat>

**<geogName>** The proper noun designation for a place, natural feature, or political jurisdiction.

<byline> → model.textPhraseLike.limited → model.nameLike → model.nameLike.place → model.nameLike.geogName → <geogName>

**<height>** Description of the vertical size of an object.

<byline> → model.textPhraseLike.limited → model.dimLike → <height>

**<heraldry>** Contains a heraldic formula or phrase, typically found as part of a blazon, coat of arms, etc.

<byline> → model.textPhraseLike.limited → model.msInline → <heraldry>

**<identifier>** An alpha-numeric string that establishes the identity of the described material.

<byline> → model.textPhraseLike.limited → model.identifierLike → <identifier>

**<lb>** An empty formatting element that forces text to begin on a new line.

<byline> → model.textPhraseLike.limited → model.lbLike → <lb>

**<librettist>** Person or organization who is a writer of the text of an opera, oratorio, etc.

<byline> → model.respLikePart → <librettist>

**<locus>** Defines a location within a manuscript or manuscript component, usually as a (possibly discontinuous) sequence of folio references.

<byline> → model.textPhraseLike.limited → model.msInline → <locus>

**<locusGrp>** Groups locations which together form a distinct but discontinuous item within a manuscript or manuscript part, according to a specific foliation.

<byline> → model.textPhraseLike.limited → model.msInline → <locusGrp>

**<lyricist>** Person or organization who is a writer of the text of a song.

<byline> → model.respLikePart → <lyricist>

**<name>** Proper noun or noun phrase.

<byline> → model.textPhraseLike.limited → model.nameLike → <name>

**<num>** Numeric information in any form.

<byline> → model.textPhraseLike.limited → model.measurementLike → model.numLike → <num>

**<periodName>** A label that describes a period of time, such as 'Baroque' or '3rd Style period'.

<byline> → model.textPhraseLike.limited → model.nameLike.label → <periodName>

**<persName>** Designation for an individual, including any or all of that individual's forenames, surnames, honorific titles, and added names.

<byline> → model.textPhraseLike.limited → model.nameLike → model.nameLike.agent → <persName>

**<postBox>** (postal box or post office box) contains a number or other identifier for some postal delivery point other than a street address.

<byline> → model.textPhraseLike.limited → model.addressPart → <postBox>

**<postCode>** (postal code) contains a numerical or alphanumeric code used as part of a postal address to simplify sorting or delivery of mail.

<byline> → model.textPhraseLike.limited → model.addressPart → <postCode>

**<ptr>** Defines a traversible pointer to another location, using only attributes to describe the destination.

<byline> → model.textPhraseLike.limited → model.locrefLike → <ptr>

**<q>** Contains material which is distinguished from the surrounding phrase-level text using quotation marks or a similar method. Use **<quote>** for block-level quotations.

<byline> → model.textPhraseLike.limited → model.qLike → <q>

**<ref>** Defines a traversible reference to another location. May contain text and sub-elements that describe the destination.

<byline> → model.textPhraseLike.limited → model.locrefLike → <ref>

**<region>** Contains the name of an administrative unit such as a state, province, or county, larger than a settlement, but smaller than a country.

<byline> → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <region>

**<relation>** Describes a relationship or linkage amongst entities.

<byline> → model.textPhraseLike.limited → model.relationLike → <relation>

**<relationList>** Gathers relation elements.

<byline> → model.textPhraseLike.limited → model.relationLike → <relationList>

**<rend>** A formatting element indicating special visual rendering, e.g., bold or italicized, of a text word or phrase.

<byline> → model.textPhraseLike.limited → model.rendLike → <rend>

**<repository>** Institution, agency, or individual which holds a bibliographic item.

<byline> → model.textPhraseLike.limited → model.nameLike → model.nameLike.place → model.repositoryLike → <repository>

**<secFolio>** Marks the word or words taken from a fixed point in a codex (typically the beginning of the second leaf) in order to provide a unique identifier for the item.

<byline> → model.textPhraseLike.limited → model.mslinline → <secFolio>

**<seg>** (arbitrary segment) represents any segmentation of text below the "text component" level.

<byline> → model.textPhraseLike.limited → <seg>

**<settlement>** Contains the name of a settlement such as a city, town, or village identified as a single geopolitical or administrative unit.

<byline> → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <settlement>

**<signatures>** Provides a description of the leaf or quire signatures found within a codex.

<byline> → model.textPhraseLike.limited → model.mslinline → <signatures>

**<sponsor>** Names of sponsoring individuals, organizations or institutions. Sponsors give their intellectual authority to a project; they are to be distinguished from funders, who provide the funding but do not necessarily take intellectual responsibility.

<byline> → model.respLikePart → <sponsor>

**<stack>** An inline table with a single column.

<byline> → model.textPhraseLike.limited → model.rendLike → <stack>

**<stamp>** Contains a word or phrase describing an official mark indicating ownership, genuineness, validity, etc.

<byline> → model.textPhraseLike.limited → model.msInline → <stamp>

**<street>** full street address including any name or number identifying a building as well as the name of the street or route on which it is located.

<byline> → model.textPhraseLike.limited → model.addressPart → <street>

**<styleName>** A label for a characteristic style of writing or performance, such as 'bebop' or 'rock-n-roll'.

<byline> → model.textPhraseLike.limited → model.nameLike.label → <styleName>

**<symbol>** A reference to a previously defined symbol.

<byline> → model.textPhraseLike.limited → <symbol>

**<term>** Keyword or phrase which describes a resource.

<byline> → model.textPhraseLike.limited → <term>

**<title>** Title of a bibliographic entity.

<byline> → model.textPhraseLike.limited → model.titleLike → <title>

**<watermark>** Contains a description of a watermark or similar device.

<byline> → model.textPhraseLike.limited → model.msInline → <watermark>

**<width>** Description of the horizontal size of an object.

<byline> → model.textPhraseLike.limited → model.dimLike → <width>

DEVELOPMENT  
VERSION

## <caesura>

Break, pause, or interruption in the normal tempo of a composition. Typically indicated by "railroad tracks", i.e., two diagonal slashes.

### Module

[MEI.shared](#)

### Attributes

**@altsym** (*optional*) Provides a way of pointing to a user-defined symbol. It must contain a reference to an ID of a [<symbolDef>](#) element elsewhere in the document. Value conforms to [data.URI](#).

<caesura> → [att.caesura.vis](#) → [att.altSym](#) → @altsym

**@class** (*optional*) Contains one or more URIs which denote classification terms that apply to the entity bearing this attribute. One or more values from [data.URI](#), separated by spaces.

<caesura> → [att.common](#) → [att.typed](#) → [att.classed](#) → @class

**@color** (*optional*) Used to indicate visual appearance. Do not confuse this with the musical term 'color' as used in pre-CMN notation. Value conforms to [data.COLOR](#).

<caesura> → [att.caesura.vis](#) → [att.color](#) → @color

**@copyof** (*optional*) Points to an element of which the current element is a copy. Value conforms to [data.URI](#).

<caesura> → [att.common](#) → [att.linking](#) → @copyof

**@corresp** (*optional*) Used to point to other elements that correspond to this one in a generic fashion. One or more values from [data.URI](#), separated by spaces.

<caesura> → [att.common](#) → [att.linking](#) → @corresp

**@dots ges** (*optional*) Number of dots required for a gestural duration when different from that of the written duration. Value conforms to [data.AUGMENTDOT](#).

<caesura> → [att.caesura.ges](#) → [att.duration.ges](#) → @dots.ges

**@dur.ges** (*optional*) Records performed duration information that differs from the written duration. Value conforms to [data.DURATION.GESTURAL](#).

<caesura> → [att.caesura.ges](#) → [att.duration.ges](#) → @dur.ges

**@dur.metrical** (*optional*) Duration as a count of units provided in the time signature denominator. Value is a decimal number.

<caesura> → [att.caesura.ges](#) → [att.duration.ges](#) → @dur.metrical

**@dur.ppq** (*optional*) Duration recorded as pulses-per-quarter note, e.g., MIDI clicks or MusicXML divisions. Value is a positive integer, including 0.

<caesura> → [att.caesura.ges](#) → [att.duration.ges](#) → @dur.ppq

**@dur.real** (*optional*) Duration in seconds, e.g., 1.732. Value is a decimal number.

<caesura> → [att.caesura.ges](#) → [att.duration.ges](#) → @dur.real

**@dur.recip** (*optional*) Duration as an optionally dotted [Humdrum \\*\\*recip value](#). Value is a [token](#).

<caesura> → [att.caesura.ges](#) → [att.duration.ges](#) → @dur.recip

**@facs** (*optional*) Points to one or more images, portions of an image, or surfaces which correspond to the current element. One or more values from [data.URI](#), separated by spaces.

<caesura> → [att.facsimile](#) → @facs

**@follows** (*optional*) points to one or more events in a user-defined collection that are known to be predecessors of the current element. One or more values from [data.URI](#), separated by spaces.

<caesura> → [att.common](#) → [att.linking](#) → @follows

**@fontfam** (*optional*) Contains the name of a font-family. Value conforms to [data.FONTFAMILY](#).

<caesura> → [att.caesura.vis](#) → [att.typography](#) → @fontfam

**@fontname** (*optional*) Holds the name of a font. Value conforms to [data.FONTNAME](#).

<caesura> → [att.caesura.vis](#) → [att.typography](#) → @fontname

**@fontsize** (*optional*) Indicates the size of a font expressed in printers' points, i.e., 1/72nd of an inch, relative terms, e.g., small, larger, etc., or percentage values relative to normal size, e.g., 125%. Value conforms to [data.FONTSIZE](#).

<caesura> → [att.caesura.vis](#) → [att.typography](#) → @fontsize

**@fontstyle** (*optional*) Records the style of a font, i.e., italic, oblique, or normal. Value conforms to [data.FONTSTYLE](#).

<caesura> → [att.caesura.vis](#) → [att.typography](#) → @fontstyle

**@fontweight** (*optional*) Used to indicate bold type. Value conforms to [data.FONTWEIGHT](#).

<caesura> → [att.caesura.vis](#) → [att.typography](#) → @fontweight

**@glyph.auth** (*optional*) A name or label associated with the controlled vocabulary from which the value of `glyph.name` or `glyph.num` is taken, or the textual content of the element. Allowed values are: "**smufl**" (*Standard Music Font Layout*.)

<caesura> → [att.caesura.vis](#) → [att.extSym](#) → [att.extSym.auth](#) → @glyph.auth

**@glyph.name** (*optional*) Glyph name. Value is plain text.

<caesura> → [att.caesura.vis](#) → [att.extSym](#) → [att.extSym.names](#) → @glyph.name

**@glyph.num** (*optional*) Numeric glyph reference in hexadecimal notation, e.g., "#xE000" or "U+E000". N.B. SMuFL version 1.18 uses the range U+E000 - U+ECBF. Value conforms to [data.HEXNUM](#).

<caesura> → [att.caesura.vis](#) → [att.extSym](#) → [att.extSym.names](#) → @glyph.num

**@glyph.uri** (*optional*) The web-accessible location of the controlled vocabulary from which the value of `glyph.name` or `glyph.num` is taken, or the textual content of the element. Value conforms to [data.URI](#).

<caesura> → [att.caesura.vis](#) → [att.extSym](#) → [att.extSym.auth](#) → @glyph.uri

**@ho** (*optional*) Records a horizontal adjustment to a feature's programmatically-determined location in terms of staff interline distance; that is, in units of 1/2 the distance between adjacent staff lines. Value conforms to [data.MEASUREMENTSIGNED](#).

<caesura> → [att.caesura.vis](#) → [att.visualOffset](#) → [att.visualOffset.ho](#) → @ho

**@label** (*optional*) Captures text to be used to generate a label for the element to which it's attached, a "tool tip" or prefatory text, for example. Should not be used to record document content. Value is plain text.

<caesura> → [att.common](#) → [att.labelled](#) → @label

**@layer** (*optional*) Identifies the layer to which a feature applies. One or more values of datatype **positiveInteger**, separated by spaces.

<caesura> → [att.caesura.log](#) → [att.layerIdent](#) → @layer

**@letterspacing** (*optional*) Indicates letter spacing (aka tracking) in analogy to the CSS letter-spacing property. Value conforms to [data.MEASUREMENTTYPOGRAPHYSIGNED](#).

<caesura> → [att.caesura.vis](#) → [att.typography](#) → @letterspacing

**@lineheight** (*optional*) Indicates line height in analogy to the CSS line-height property. Value conforms to either [data.MEASUREMENTTYPOGRAPHYUNSIGNED](#) or [data.PERCENT](#).

<caesura> → att.caesura.vis → att.typography → @lineheight

**@loc** (*optional*) Holds the staff location of the feature. Value conforms to [data.STAFFLOC](#).

<caesura> → att.caesura.vis → att.staffLoc → @loc

**@n** (*optional*) Provides a number-like designation that indicates an element's position in a sequence of similar elements. May not contain space characters. Value conforms to [data.WORD](#).

<caesura> → att.common → att.nNumberLike → @n

**@next** (*optional*) Used to point to the next event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<caesura> → att.common → att.linking → @next

**@oloc** (*optional*) Records staff location in terms of written octave. Value conforms to [data.OCTAVE](#).

<caesura> → att.caesura.vis → att.staffLoc.pitched → @oloc

**@part** (*optional*) Indicates the part in which the current feature should appear. Use '%all' when the feature should occur in every part. One or more values of datatype **a string matching the following regular expression: "(%all|#[\i][\c]+)"**, separated by spaces.

<caesura> → att.caesura.log → att.partIdent → @part

**@partstaff** (*optional*) Signifies the part staff on which a notated feature occurs. Use '%all' when the feature should occur on every staff. One or more values of datatype **a string matching the following regular expression: "(%all|\d+(-\d+)?)"**, separated by spaces.

<caesura> → att.caesura.log → att.partIdent → @partstaff

**@place** (*optional*) Captures the placement of the item with respect to the staff with which it is associated. Value conforms to [data.STAFFREL](#).

<caesura> → att.caesura.vis → att.placementRelStaff → @place

**@ploc** (*optional*) Captures staff location in terms of written pitch name. Value conforms to [data.PITCHNAME](#).

<caesura> → att.caesura.vis → att.staffLoc.pitched → @ploc

**@precedes** (*optional*) Points to one or more events in a user-defined collection that are known to be successors of the current element. One or more values from [data.URI](#), separated by spaces.

<caesura> → att.common → att.linking → @precedes

**@prev** (*optional*) Points to the previous event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<caesura> → att.common → att.linking → @prev

**@resp** (*optional*) Indicates the agent(s) responsible for some aspect of the text's transcription, editing, or encoding. Its value must point to one or more identifiers declared in the document header. One or more values from [data.URI](#), separated by spaces.

<caesura> → att.common → att.responsibility → @resp

**@sameas** (*optional*) Points to an element that is the same as the current element but is not a literal copy of the current element. One or more values from [data.URI](#), separated by spaces.

<caesura> → att.common → att.linking → @sameas

**@staff** (*recommended*) Signifies the staff on which a notated event occurs or to which a control event applies. Mandatory when applicable. One or more values of datatype **positiveInteger**, separated by spaces.

<caesura> → att.caesura.log → att.staffId → @staff

**@startid** (*optional*) Holds a reference to the first element in a sequence of events to which the feature applies. Value conforms to [data.URI](#).

<caesura> → att.caesura.log → att.startId → @startid

**@synch** (*optional*) Points to elements that are synchronous with the current element. One or more values from [data.URI](#), separated by spaces.

<caesura> → att.common → att.linked → @synch

**@to** (*optional*) Records a timestamp adjustment of a feature's programmatically-determined location in terms of musical time; that is, beats. Value conforms to [data.TSTAMPOFFSET](#).

<caesura> → att.caesura.vis → att.visualOffset → att.visualOffset.to → @to

**@tstamp** (*optional*) Encodes the onset time in terms of musical time, i.e., beats[.fractional beat part], as expressed in the written time signature. Value conforms to [data.BEAT](#).

<caesura> → att.caesura.log → att.timestamp.log → @tstamp

**@tstamp.ges** (*optional*) Encodes the onset time in terms of musical time, i.e., beats[.fractional beat part], as expressed in the written time signature. Value conforms to [data.BEAT](#).

<caesura> → att.caesura.ges → att.timestamp.ges → @tstamp.ges

**@tstamp.real** (*optional*) Records the onset time in terms of ISO time. Value conforms to [data.ISOTIME](#).

<caesura> → att.caesura.ges → att.timestamp.ges → @tstamp.real

**@type** (*optional*) Designation which characterizes the element in some sense, using any convenient classification scheme or typology that employs single-token labels. One or more values of datatype **NMTOKEN**, separated by spaces.

<caesura> → att.common → att.type → @type

**@vo** (*optional*) Records the vertical adjustment of a feature's programmatically-determined location in terms of staff interline distance; that is, in units of 1/2 the distance between adjacent staff lines. Value conforms to [data.MEASUREMENTSIGNED](#).

<caesura> → att.caesura.vis → att.visualOffset → att.visualOffset.vo → @vo

**@x** (*optional*) Encodes an x coordinate for a feature in an output coordinate system. When it is necessary to record the placement of a feature in a facsimile image, use the `facs` attribute. Value is a decimal number.

<caesura> → att.caesura.vis → att.xy → @x

**@xml:base** (*optional*) Provides a base URI reference with which applications can resolve relative URI references into absolute URI references. Value conforms to [data.URI](#).

<caesura> → att.common → att.basic → @xml:base

**@xml:id** (*optional*) Regularizes the naming of an element and thus facilitates building links between it and other resources. Each `id` attribute within a document must have a unique value. Value is a valid `xml:id`.

<caesura> → att.common → att.basic → att.id → @xml:id

**@y (optional)** Encodes a y coordinate for a feature in an output coordinate system. When it is necessary to record the placement of a feature in a facsimile image, use the `facs` attribute. Value is a decimal number.

<caesura> → `att.caesura.vis` → `att.xy` → `@y`

### Member of

`model.controlEventLike` Groups elements, such as dynamics, ties, phrase marks, pedal marks, etc., which depend upon other events, such as notes or rests, for their existence.

### Contained By

**<abbr>** A generic element for 1) a shortened form of a word, including an acronym or 2) a shorthand notation.

<caesura> → `model.controlEventLike` → `model.editTransPart.music` → `model.editTransPart` → <abbr>

**<add>** Marks an addition to the text.

<caesura> → `model.controlEventLike` → `model.editTransPart.music` → `model.editTransPart` → <add>

**<corr>** Contains the correct form of an apparent erroneous passage.

<caesura> → `model.controlEventLike` → `model.editTransPart.music` → `model.editTransPart` → <corr>

**<damage>** Contains an area of damage to the physical medium.

<caesura> → `model.controlEventLike` → `model.editTransPart.music` → `model.editTransPart` → <damage>

**<del>** Contains information deleted, marked as deleted, or otherwise indicated as superfluous or spurious in the copy text by an author, scribe, annotator, or corrector.

<caesura> → `model.controlEventLike` → `model.editTransPart.music` → `model.editTransPart` → <del>

**<expan>** Contains the expansion of an abbreviation.

<caesura> → `model.controlEventLike` → `model.editTransPart.music` → `model.editTransPart` → <expan>

**<lem>** (lemma) – Contains the lemma, or base text, of a textual variation.

<caesura> → `model.controlEventLike` → `model.rdgPart.music` → `model.rdgPart` → <lem>

**<measure>** Unit of musical time consisting of a fixed number of note values of a given type, as determined by the prevailing meter, and delimited in musical notation by bar lines.

<caesura> → `model.controlEventLike` → `model.measurePart` → <measure>

**<oStaff>** A staff that holds an alternative passage which may be played instead of the original material.

<caesura> → `model.controlEventLike` → `model.staffPart.mensural` → `model.staffPart.mensuralAndNeumes` → `model.staffPart` → <oStaff>

**<orig>** Contains material which is marked as following the original, rather than being normalized or corrected.

<caesura> → `model.controlEventLike` → `model.editTransPart.music` → `model.editTransPart` → <orig>

**<rdg>** (reading) – Contains a single reading within a textual variation.

<caesura> → `model.controlEventLike` → `model.rdgPart.music` → `model.rdgPart` → <rdg>

**<reg>** Contains material which has been regularized or normalized in some sense.

<caesura> → `model.controlEventLike` → `model.editTransPart.music` → `model.editTransPart` → <reg>

**<restore>** Indicates restoration of material to an earlier state by cancellation of an editorial or authorial marking or instruction.

<caesura> → `model.controlEventLike` → `model.editTransPart.music` → `model.editTransPart` → <restore>

**<sic>** Contains apparently incorrect or inaccurate material.

<caesura> → `model.controlEventLike` → `model.editTransPart.music` → `model.editTransPart` → <sic>

**<staff>** A group of equidistant horizontal lines on which notes are placed in order to represent pitch or a grouping element for individual 'strands' of notes, rests, etc. that may or may not actually be rendered on staff lines; that is, both diastematic and non-diastematic signs.

<caesura> → model.controlEventLike → model.staffPart.mensural → model.staffPart.mensuralAndNeumes → model.staffPart → <staff>

**<supplied>** Contains material supplied by the transcriber or editor for any reason.

<caesura> → model.controlEventLike → model.editTransPart.music → model.editTransPart → <supplied>

**<syllable>** Neume notation can be thought of as "neumed text". Therefore, the syllable element provides high-level organization in this repertoire.

<caesura> → model.controlEventLike → model.syllablePart → <syllable>

**<unclear>** Contains material that cannot be transcribed with certainty because it is illegible or inaudible in the source.

<caesura> → model.controlEventLike → model.editTransPart.music → model.editTransPart → <unclear>

## May Contain

- (<caesura> *may not have child elements*)

## Remarks

The caesura often indicates an abrupt interruption in the performance followed by an equally sudden resumption. Its duration is typically shorter than a grand pause (G.P.) or long pause (L.P.), but longer than that indicated by a **<breath>** mark. When combined with a **<fermata>** a longer silence is usually implied. The starting point of the caesura may be indicated by either a startid, tstamp, tstamp.ges, or tstamp.real attribute. It is a semantic error not to specify a starting point attribute.

Unlike the **<breath>** mark, a caesura may have a performed duration. Also, while the default value for place on the breath mark is above, the default value for place for a caesura is within. Unless indicated by other attributes, a caesura will be rendered as a pair of slanted lines through the top line of the staff.

## Constraints

Must have one of the attributes: startid, tstamp, tstamp.ges or tstamp.real.

## Declaration

```
<elementSpec ident="caesura" module="MEI.shared">
  <desc xml:lang="en">Break, pause, or interruption in the normal tempo of a composition.
  Typically indicated by "railroad tracks",
    <abbr>i.e.</abbr>
    , two diagonal slashes.</desc>

### Module

[MEI.shared](#)

### Attributes

**@class** (*optional*) Contains one or more URIs which denote classification terms that apply to the entity bearing this attribute. One or more values from [data.URI](#), separated by spaces.

<caption> → [att.common](#) → [att.typed](#) → [att.classed](#) → @class

**@copyof** (*optional*) Points to an element of which the current element is a copy. Value conforms to [data.URI](#).

<caption> → [att.common](#) → [att.linkin](#) → @copyof

**@corresp** (*optional*) Used to point to other elements that correspond to this one in a generic fashion. One or more values from [data.URI](#), separated by spaces.

<caption> → [att.common](#) → [att.linkin](#) → @corresp

**@facs** (*optional*) Points to one or more images, portions of an image, or surfaces which correspond to the current element. One or more values from [data.URI](#), separated by spaces.

<caption> → [att.facsimile](#) → @facs

**@follows** (*optional*) points to one or more events in a user-defined collection that are known to be predecessors of the current element. One or more values from [data.URI](#), separated by spaces.

<caption> → [att.common](#) → [att.linkin](#) → @follows

**@label** (*optional*) Captures text to be used to generate a label for the element to which it's attached, a "tool tip" or prefatory text, for example. Should not be used to record document content. Value is plain text.

<caption> → [att.common](#) → [att.labell](#) → @label

**@n** (*optional*) Provides a number-like designation that indicates an element's position in a sequence of similar elements. May not contain space characters. Value conforms to [data.WORD](#).

<caption> → [att.common](#) → [att.nNumberLike](#) → @n

**@next** (*optional*) Used to point to the next event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<caption> → [att.common](#) → [att.linkin](#) → @next

**@precedes** (*optional*) Points to one or more events in a user-defined collection that are known to be successors of the current element. One or more values from [data.URI](#), separated by spaces.

<caption> → [att.common](#) → [att.linkin](#) → @precedes

**@prev** (*optional*) Points to the previous event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<caption> → [att.common](#) → [att.linkin](#) → @prev

**@resp** (*optional*) Indicates the agent(s) responsible for some aspect of the text's transcription, editing, or encoding. Its value must point to one or more identifiers declared in the document header. One or more values from [data.URI](#), separated by spaces.

<caption> → [att.common](#) → [att.responsibility](#) → @resp

**@sameas** (*optional*) Points to an element that is the same as the current element but is not a literal copy of the current element. One or more values from [data.URI](#), separated by spaces.

<caption> → [att.common](#) → [att.linking](#) → @sameas

**@synch** (*optional*) Points to elements that are synchronous with the current element. One or more values from [data.URI](#), separated by spaces.

<caption> → [att.common](#) → [att.linking](#) → @synch

**@translit** (*optional*) Specifies the transliteration technique used. Value is a [NMOKEN](#).

<caption> → [att.common](#) → [att.lang](#) → @translit

**@type** (*optional*) Designation which characterizes the element in some sense, using any convenient classification scheme or typology that employs single-token labels. One or more values of datatype [NMOKEN](#), separated by spaces.

<caption> → [att.common](#) → [att.typed](#) → @type

**@xml:base** (*optional*) Provides a base URI reference with which applications can resolve relative URI references into absolute URI references. Value conforms to [data.URI](#).

<caption> → [att.common](#) → [att.basic](#) → @xml:base

**@xml:id** (*optional*) Regularizes the naming of an element and thus facilitates building links between it and other resources. Each id attribute within a document must have a unique value. Value is a valid [xml:id](#).

<caption> → [att.common](#) → [att.basic](#) → [att.id](#) → @xml:id

**@xml:lang** (*optional*) Identifies the language of the element's content. The values for this attribute are language 'tags' as defined in BCP 47. All language tags that make use of private use sub-tags must be documented in a corresponding language element in the MEI header whose id attribute is the same as the language tag's value. Value is a [language](#).

<caption> → [att.lang](#) → @xml:lang

## Member of

[model.captionLike](#) Groups elements that contain the text of a caption or other text displayed along with a figure.

## Contained By

**<fig>** Groups elements representing or containing graphic information such as an illustration or figure.

<caption> → [model.captionLike](#) → <fig>

**<table>** Contains text displayed in tabular form.

<caption> → [model.captionLike](#) → <table>

## May Contain

**<abbr>** A generic element for 1) a shortened form of a word, including an acronym or 2) a shorthand notation.

<caption> → [model.textPhraseLike](#) → [model.textPhraseLike.limited](#) → [model.editorialLike](#) → <abbr>

**<add>** Marks an addition to the text.

<caption> → model.transcriptionLike → <add>

**<address>** Contains a postal address, for example of a publisher, an organization, or an individual.

<caption> → model.textPhraseLike → model.textPhraseLike.limited → model.addressLike → <address>

**<annot>** Provides a statement explaining the text or indicating the basis for an assertion.

<caption> → model.textPhraseLike → model.textPhraseLike.limited → model.annotLike → <annot>

**<bibl>** Provides a loosely-structured bibliographic citation in which the sub-components may or may not be explicitly marked.

<caption> → model.textPhraseLike → model.textPhraseLike.limited → model.biblLike → <bibl>

**<biblStruct>** Contains a bibliographic citation in which bibliographic sub-elements must appear in a specified order.

<caption> → model.textPhraseLike → model.textPhraseLike.limited → model.biblLike → <biblStruct>

**<bloc>** Contains the name of a geopolitical unit consisting of two or more nation states or countries.

<caption> → model.textPhraseLike → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <bloc>

**<catchwords>** Describes the system used to ensure correct ordering of the quires making up an item, typically by means of annotations at the foot of the page.

<caption> → model.textPhraseLike → model.textPhraseLike.limited → model.mslnline → <catchwords>

**<choice>** Groups a number of alternative encodings for the same point in a text.

<caption> → model.editLike → <choice>

**<corpName>** Identifies an organization or group of people that acts as a single entity.

<caption> → model.textPhraseLike → model.textPhraseLike.limited → model.nameLike → model.nameLike.agent → <corpName>

**<corr>** Contains the correct form of an apparent erroneous passage.

<caption> → model.transcriptionLike → <corr>

**<country>** Contains the name of a geopolitical unit, such as a nation, country, colony, or commonwealth, larger than or administratively superior to a region and smaller than a bloc.

<caption> → model.textPhraseLike → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <country>

**<damage>** Contains an area of damage to the physical medium.

<caption> → model.transcriptionLike → <damage>

**<date>** A string identifying a point in time or the time period between two such points.

<caption> → model.textPhraseLike → model.textPhraseLike.limited → model.dateLike → <date>

**<dedic平ee>** Entity to whom a creative work is formally offered.

<caption> → model.textPhraseLike → model.textPhraseLike.limited → <dedic平ee>

**<del>** Contains information deleted, marked as deleted, or otherwise indicated as superfluous or spurious in the copy text by an author, scribe, annotator, or corrector.

<caption> → model.transcriptionLike → <del>

**<depth>** Description of a measurement taken through a three-dimensional object.

<caption> → model.textPhraseLike → model.textPhraseLike.limited → model.dimLike → <depth>

**<dim>** Any single dimensional specification.

<caption> → model.textPhraseLike → model.textPhraseLike.limited → model.dimLike → <dim>

**<dimensions>** Information about the physical size of an entity; usually includes numerical data.

<caption> → model.textPhraseLike → model.textPhraseLike.limited → <dimensions>

**<district>** Contains the name of any kind of subdivision of a settlement, such as a parish, ward, or other administrative or geographic unit.

<caption> → model.textPhraseLike → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <district>

**<expan>** Contains the expansion of an abbreviation.

<caption> → model.textPhraseLike → model.textPhraseLike.limited → model.editorialLike → <expan>

**<extent>** Used to express size in terms other than physical dimensions, such as number of pages, records, bytes, physical components, etc.

<caption> → model.textPhraseLike → model.textPhraseLike.limited → <extent>

**<fig>** Groups elements representing or containing graphic information such as an illustration or figure.

<caption> → model.textPhraseLike → model.textPhraseLike.limited → model.figureLike → <fig>

**<gap>** Indicates a point where material has been omitted in a transcription, whether as part of sampling practice or for editorial reasons described in the MEI header.

<caption> → model.transcriptionLike → <gap>

**<geogFeat>** Contains a common noun identifying a geographical feature.

<caption> → model.textPhraseLike → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <geogFeat>

**<geogName>** The proper noun designation for a place, natural feature, or political jurisdiction.

<caption> → model.textPhraseLike → model.textPhraseLike.limited → model.nameLike → model.nameLike.place → model.nameLike.geogName → <geogName>

**<handShift>** Marks the beginning of a passage written in a new hand, or of a change in the scribe, writing style, ink or character of the document hand.

<caption> → model.transcriptionLike → <handShift>

**<height>** Description of the vertical size of an object.

<caption> → model.textPhraseLike → model.textPhraseLike.limited → model.dimLike → <height>

**<heraldry>** Contains a heraldic formula or phrase, typically found as part of a blazon, coat of arms, etc.

<caption> → model.textPhraseLike → model.textPhraseLike.limited → model.msInline → <heraldry>

**<identifier>** An alpha-numeric string that establishes the identity of the described material.

<caption> → model.textPhraseLike → model.textPhraseLike.limited → model.identifierLike → <identifier>

**<lb>** An empty formatting element that forces text to begin on a new line.

<caption> → model.textPhraseLike → model.textPhraseLike.limited → model.lbLike → <lb>

**<locus>** Defines a location within a manuscript or manuscript component, usually as a (possibly discontinuous) sequence of folio references.

<caption> → model.textPhraseLike → model.textPhraseLike.limited → model.msInline → <locus>

**<locusGrp>** Groups locations which together form a distinct but discontinuous item within a manuscript or manuscript part, according to a specific foliation.

<caption> → model.textPhraseLike → model.textPhraseLike.limited → model.msInline → <locusGrp>

**<name>** Proper noun or noun phrase.

<caption> → model.textPhraseLike → model.textPhraseLike.limited → model.nameLike → <name>

**<num>** Numeric information in any form.

<caption> → model.textPhraseLike → model.textPhraseLike.limited → model.measurementLike → model.numLike → <num>

**<orig>** Contains material which is marked as following the original, rather than being normalized or corrected.

<caption> → model.transcriptionLike → <orig>

**<pb>** An empty formatting element that forces text to begin on a new page.

<caption> → model.textPhraseLike → model.pbLike → <pb>

**<periodName>** A label that describes a period of time, such as 'Baroque' or '3rd Style period'.

<caption> → model.textPhraseLike → model.textPhraseLike.limited → model.nameLike.label → <periodName>

**<persName>** Designation for an individual, including any or all of that individual's forenames, surnames, honorific titles, and added names.

<caption> → model.textPhraseLike → model.textPhraseLike.limited → model.nameLike → model.nameLike.agent → <persName>

**<postBox>** (postal box or post office box) contains a number or other identifier for some postal delivery point other than a street address.

<caption> → model.textPhraseLike → model.textPhraseLike.limited → model.addressPart → <postBox>

**<postCode>** (postal code) contains a numerical or alphanumeric code used as part of a postal address to simplify sorting or delivery of mail.

<caption> → model.textPhraseLike → model.textPhraseLike.limited → model.addressPart → <postCode>

**<ptr>** Defines a traversible pointer to another location, using only attributes to describe the destination.

<caption> → model.textPhraseLike → model.textPhraseLike.limited → model.locrefLike → <ptr>

**<q>** Contains material which is distinguished from the surrounding phrase-level text using quotation marks or a similar method. Use <quote> for block-level quotations.

<caption> → model.textPhraseLike → model.textPhraseLike.limited → model.qLike → <q>

**<ref>** Defines a traversible reference to another location. May contain text and sub-elements that describe the destination.

<caption> → model.textPhraseLike → model.textPhraseLike.limited → model.locrefLike → <ref>

**<reg>** Contains material which has been regularized or normalized in some sense.

<caption> → model.transcriptionLike → <reg>

**<region>** Contains the name of an administrative unit such as a state, province, or county, larger than a settlement, but smaller than a country.

<caption> → model.textPhraseLike → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <region>

**<relation>** Describes a relationship or linkage amongst entities.

<caption> → model.textPhraseLike → model.textPhraseLike.limited → model.relationLike → <relation>

**<relationList>** Gathers relation elements.

<caption> → model.textPhraseLike → model.textPhraseLike.limited → model.relationLike → <relationList>

**<rend>** A formatting element indicating special visual rendering, e.g., bold or italicized, of a text word or phrase.

<caption> → model.textPhraseLike → model.textPhraseLike.limited → model.rendLike → <rend>

**<repository>** Institution, agency, or individual which holds a bibliographic item.

<caption> → model.textPhraseLike → model.textPhraseLike.limited → model.nameLike → model.nameLike.place → model.repositoryLike → <repository>

**<restore>** Indicates restoration of material to an earlier state by cancellation of an editorial or authorial marking or instruction.

<caption> → model.transcriptionLike → <restore>

**<secFolio>** Marks the word or words taken from a fixed point in a codex (typically the beginning of the second leaf) in order to provide a unique identifier for the item.

<caption> → model.textPhraseLike → model.textPhraseLike.limited → model.mslinline → <secFolio>

**<seg>** (arbitrary segment) represents any segmentation of text below the "text component" level.

<caption> → model.textPhraseLike → model.textPhraseLike.limited → <seg>

**<settlement>** Contains the name of a settlement such as a city, town, or village identified as a single geopolitical or administrative unit.

<caption> → model.textPhraseLike → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <settlement>

**<sic>** Contains apparently incorrect or inaccurate material.

<caption> → model.transcriptionLike → <sic>

**<signatures>** Provides a description of the leaf or quire signatures found within a codex.

<caption> → model.textPhraseLike → model.textPhraseLike.limited → model.msInline → <signatures>

**<stack>** An inline table with a single column.

<caption> → model.textPhraseLike → model.textPhraseLike.limited → model.rendLike → <stack>

**<stamp>** Contains a word or phrase describing an official mark indicating ownership, genuineness, validity, etc.

<caption> → model.textPhraseLike → model.textPhraseLike.limited → model.msInline → <stamp>

**<street>** full street address including any name or number identifying a building as well as the name of the street or route on which it is located.

<caption> → model.textPhraseLike → model.textPhraseLike.limited → model.addressPart → <street>

**<styleName>** A label for a characteristic style of writing or performance, such as 'bebop' or 'rock-n-roll'.

<caption> → model.textPhraseLike → model.textPhraseLike.limited → model.nameLike.label → <styleName>

**<subst>** Groups transcriptional elements when the combination is to be regarded as a single intervention in the text.

<caption> → model.editLike → <subst>

**<supplied>** Contains material supplied by the transcriber or editor for any reason.

<caption> → model.transcriptionLike → <supplied>

**<symbol>** A reference to a previously defined symbol.

<caption> → model.textPhraseLike → model.textPhraseLike.limited → <symbol>

**<term>** Keyword or phrase which describes a resource.

<caption> → model.textPhraseLike → model.textPhraseLike.limited → <term>

**<title>** Title of a bibliographic entity.

<caption> → model.textPhraseLike → model.textPhraseLike.limited → model.titleLike → <title>

**<unclear>** Contains material that cannot be transcribed with certainty because it is illegible or inaudible in the source.

<caption> → model.transcriptionLike → <unclear>

**<watermark>** Contains a description of a watermark or similar device.

<caption> → model.textPhraseLike → model.textPhraseLike.limited → model.msInline → <watermark>

**<width>** Description of the horizontal size of an object.

<caption> → model.textPhraseLike → model.textPhraseLike.limited → model.dimLike → <width>

## <captureMode>

(capture mode) – The means used to record notation, sound, or images in the production of a source/manifestation (e.g., analogue, acoustic, electric, digital, optical etc.).

### Module

[MEI.header](#)

### Attributes

**@analog** (*optional*) Contains a reference to a field or element in another descriptive encoding system to which this MEI element is comparable. Value is plain text.

<captureMode> → [att.bibl](#) → @analog

**@auth** (*optional*) A name or label associated with a controlled vocabulary or other authoritative source for this element or its content. Value is plain text.

<captureMode> → [att.authorized](#) → @auth

**@auth.uri** (*optional*) A web-accessible location of the controlled vocabulary or other authoritative source of identification or definition for this element or its content. This attribute may contain a complete URI or a partial URI which is completed by the value of the codedval attribute. Value conforms to [data.URI](#).  
<captureMode> → [att.authorized](#) → @auth.uri

**@class** (*optional*) Contains one or more URIs which denote classification terms that apply to the entity bearing this attribute. One or more values from [data.URI](#), separated by spaces.

<captureMode> → [att.common](#) → [att.typed](#) → [att.classed](#) → @class

**@codedval** (*optional*) A value that represents or identifies other data. Often, it is a primary key in the database or a unique value in the coded list identified by the auth or auth.uri attributes. One or more values of datatype **NMTOKEN**, separated by spaces.

<captureMode> → [att.authorized](#) → [att.canonical](#) → @codedval

**@copyof** (*optional*) Points to an element of which the current element is a copy. Value conforms to [data.URI](#).

<captureMode> → [att.common](#) → [att.linked](#) → @copyof

**@corresp** (*optional*) Used to point to other elements that correspond to this one in a generic fashion. One or more values from [data.URI](#), separated by spaces.

<captureMode> → [att.common](#) → [att.linked](#) → @corresp

**@follows** (*optional*) points to one or more events in a user-defined collection that are known to be predecessors of the current element. One or more values from [data.URI](#), separated by spaces.

<captureMode> → [att.common](#) → [att.linked](#) → @follows

**@label** (*optional*) Captures text to be used to generate a label for the element to which it's attached, a "tool tip" or prefatory text, for example. Should not be used to record document content. Value is plain text.

<captureMode> → [att.common](#) → [att.labelled](#) → @label

**@n** (*optional*) Provides a number-like designation that indicates an element's position in a sequence of similar elements. May not contain space characters. Value conforms to [data.WORD](#).

<captureMode> → [att.common](#) → [att.nNumberLike](#) → @n

**@next** (*optional*) Used to point to the next event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<captureMode> → att.common → att.linkin → @next

**@precedes** (*optional*) Points to one or more events in a user-defined collection that are known to be successors of the current element. One or more values from [data.URI](#), separated by spaces.

<captureMode> → att.common → att.linkin → @precedes

**@prev** (*optional*) Points to the previous event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<captureMode> → att.common → att.linkin → @prev

**@resp** (*optional*) Indicates the agent(s) responsible for some aspect of the text's transcription, editing, or encoding. Its value must point to one or more identifiers declared in the document header. One or more values from [data.URI](#), separated by spaces.

<captureMode> → att.common → att.responsibility → @resp

**@sameas** (*optional*) Points to an element that is the same as the current element but is not a literal copy of the current element. One or more values from [data.URI](#), separated by spaces.

<captureMode> → att.common → att.linkin → @sameas

**@synch** (*optional*) Points to elements that are synchronous with the current element. One or more values from [data.URI](#), separated by spaces.

<captureMode> → att.common → att.linkin → @synch

**@translit** (*optional*) Specifies the transliteration technique used. Value is a [NMTOKEN](#).

<captureMode> → att.lang → @translit

**@type** (*optional*) Designation which characterizes the element in some sense, using any convenient classification scheme or typology that employs single-token labels. One or more values of datatype [NMTOKEN](#), separated by spaces.

<captureMode> → att.common → att.typed → @type

**@xml:base** (*optional*) Provides a base URI reference with which applications can resolve relative URI references into absolute URI references. Value conforms to [data.URI](#).

<captureMode> → att.common → att.basic → @xml:base

**@xml:id** (*optional*) Regularizes the naming of an element and thus facilitates building links between it and other resources. Each id attribute within a document must have a unique value. Value is a valid [xml:id](#).

<captureMode> → att.common → att.basic → att.id → @xml:id

**@xml:lang** (*optional*) Identifies the language of the element's content. The values for this attribute are language 'tags' as defined in BCP 47. All language tags that make use of private use sub-tags must be documented in a corresponding language element in the MEI header whose id attribute is the same as the language tag's value. Value is a [language](#).

<captureMode> → att.lang → @xml:lang

## Member of

[model.physDescPart](#) Groups elements that may appear as part of the physical description of a bibliographic item.

## Contained By

**<physDesc>** Container for information about the appearance, construction, or handling of physical materials, such as their dimension, quantity, color, style, and technique of creation.

<captureMode> → [model.physDescPart](#) → <physDesc>

## May Contain

**<abbr>** A generic element for 1) a shortened form of a word, including an acronym or 2) a shorthand notation.

<captureMode> → [macro.struc-unstrucContent](#) → [model.textPhraseLike.limited](#) → [model.editorialLike](#) → <abbr>

**<address>** Contains a postal address, for example of a publisher, an organization, or an individual.

<captureMode> → [macro.struc-unstrucContent](#) → [model.textPhraseLike.limited](#) → [model.addressLike](#) → <address>

**<annot>** Provides a statement explaining the text or indicating the basis for an assertion.

<captureMode> → [macro.struc-unstrucContent](#) → [model.textPhraseLike.limited](#) → [model.annotLike](#) → <annot>

**<bibl>** Provides a loosely-structured bibliographic citation in which the sub-components may or may not be explicitly marked.

<captureMode> → [macro.struc-unstrucContent](#) → [model.textPhraseLike.limited](#) → [model.biblLike](#) → <bibl>

**<biblStruct>** Contains a bibliographic citation in which bibliographic sub-elements must appear in a specified order.

<captureMode> → [macro.struc-unstrucContent](#) → [model.textPhraseLike.limited](#) → [model.biblLike](#) → <biblStruct>

**<bloc>** Contains the name of a geopolitical unit consisting of two or more nation states or countries.

<captureMode> → [macro.struc-unstrucContent](#) → [model.textPhraseLike.limited](#) → [model.addressPart](#) → [model.geogNamePart](#) → <bloc>

**<catchwords>** Describes the system used to ensure correct ordering of the quires making up an item, typically by means of annotations at the foot of the page.

<captureMode> → [macro.struc-unstrucContent](#) → [model.textPhraseLike.limited](#) → [model.msInLine](#) → <catchwords>

**<corpName>** Identifies an organization or group of people that acts as a single entity.

<captureMode> → [macro.struc-unstrucContent](#) → [model.textPhraseLike.limited](#) → [model.nameLike](#) → [model.nameLike.agent](#) → <corpName>

**<country>** Contains the name of a geopolitical unit, such as a nation, country, colony, or commonwealth, larger than or administratively superior to a region and smaller than a bloc.

<captureMode> → [macro.struc-unstrucContent](#) → [model.textPhraseLike.limited](#) → [model.addressPart](#) → [model.geogNamePart](#) → <country>

**<date>** A string identifying a point in time or the time period between two such points.

<captureMode> → [macro.struc-unstrucContent](#) → [model.textPhraseLike.limited](#) → [model.dateLike](#) → <date>

**<dedictee>** Entity to whom a creative work is formally offered.

<captureMode> → [macro.struc-unstrucContent](#) → [model.textPhraseLike.limited](#) → <dedictee>

**<depth>** Description of a measurement taken through a three-dimensional object.

<captureMode> → [macro.struc-unstrucContent](#) → [model.textPhraseLike.limited](#) → [model.dimLike](#) → <depth>

**<dim>** Any single dimensional specification.

<captureMode> → [macro.struc-unstrucContent](#) → [model.textPhraseLike.limited](#) → [model.dimLike](#) → <dim>

**<dimensions>** Information about the physical size of an entity; usually includes numerical data.

<captureMode> → [macro.struc-unstrucContent](#) → [model.textPhraseLike.limited](#) → <dimensions>

**<district>** Contains the name of any kind of subdivision of a settlement, such as a parish, ward, or other administrative or geographic unit.

<captureMode> → [macro.struc-unstrucContent](#) → [model.textPhraseLike.limited](#) → [model.addressPart](#) → [model.geogNamePart](#) → <district>

**<expan>** Contains the expansion of an abbreviation.

<captureMode> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.editorialLike → <expan>

**<extent>** Used to express size in terms other than physical dimensions, such as number of pages, records, bytes, physical components, etc.

<captureMode> → macro.struc-unstrucContent → model.textPhraseLike.limited → <extent>

**<fig>** Groups elements representing or containing graphic information such as an illustration or figure.

<captureMode> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.figureLike → <fig>

**<geogFeat>** Contains a common noun identifying a geographical feature.

<captureMode> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <geogFeat>

**<geogName>** The proper noun designation for a place, natural feature, or political jurisdiction.

<captureMode> → macro.struc-

unstrucContent → model.textPhraseLike.limited → model.nameLike → model.nameLike.place → model.nameLike.geogName → <geogName>

**<head>** Contains any heading, for example, the title of a section of text, or the heading of a list.

<captureMode> → macro.struc-unstrucContent → model.headLike → <head>

**<height>** Description of the vertical size of an object.

<captureMode> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.dimLike → <height>

**<heraldry>** Contains a heraldic formula or phrase, typically found as part of a blazon, coat of arms, etc.

<captureMode> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.mslinline → <heraldry>

**<identifier>** An alpha-numeric string that establishes the identity of the described material.

<captureMode> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.identifierLike → <identifier>

**<lb>** An empty formatting element that forces text to begin on a new line.

<captureMode> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.lbLike → <lb>

**<locus>** Defines a location within a manuscript or manuscript component, usually as a (possibly discontinuous) sequence of folio references.

<captureMode> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.mslinline → <locus>

**<locusGrp>** Groups locations which together form a distinct but discontinuous item within a manuscript or manuscript part, according to a specific foliation.

<captureMode> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.mslinline → <locusGrp>

**<name>** Proper noun or noun phrase.

<captureMode> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.nameLike → <name>

**<num>** Numeric information in any form.

<captureMode> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.measurementLike → model.numLike → <num>

**<p>** One or more text phrases that form a logical prose passage.

<captureMode> → macro.struc-unstrucContent → model.pLike → <p>

**<periodName>** A label that describes a period of time, such as 'Baroque' or '3rd Style period'.

<captureMode> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.nameLike.label → <periodName>

**<persName>** Designation for an individual, including any or all of that individual's forenames, surnames, honorific titles, and added names.

<captureMode> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.nameLike → model.nameLike.agent → <persName>

**<postBox>** (postal box or post office box) contains a number or other identifier for some postal delivery point other than a street address.

<captureMode> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.addressPart → <postBox>

**<postCode>** (postal code) contains a numerical or alphanumeric code used as part of a postal address to simplify sorting or delivery of mail.

<captureMode> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.addressPart → <postCode>

**<ptr>** Defines a traversible pointer to another location, using only attributes to describe the destination.

<captureMode> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.locrefLike → <ptr>

**<q>** Contains material which is distinguished from the surrounding phrase-level text using quotation marks or a similar method. Use <quote> for block-level quotations.

<captureMode> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.qLike → <q>

**<ref>** Defines a traversible reference to another location. May contain text and sub-elements that describe the destination.

<captureMode> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.locrefLike → <ref>

**<region>** Contains the name of an administrative unit such as a state, province, or county, larger than a settlement, but smaller than a country.

<captureMode> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <region>

**<relation>** Describes a relationship or linkage amongst entities.

<captureMode> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.relationLike → <relation>

**<relationList>** Gathers relation elements.

<captureMode> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.relationLike → <relationList>

**<rend>** A formatting element indicating special visual rendering, e.g., bold or italicized, of a text word or phrase.

<captureMode> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.rendLike → <rend>

**<repository>** Institution, agency, or individual which holds a bibliographic item.

<captureMode> → macro.struc-

unstrucContent → model.textPhraseLike.limited → model.nameLike → model.nameLike.place → model.repositoryLike → <repository>

**<secFolio>** Marks the word or words taken from a fixed point in a codex (typically the beginning of the second leaf) in order to provide a unique identifier for the item.

<captureMode> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.msInLine → <secFolio>

**<seg>** (arbitrary segment) represents any segmentation of text below the "text component" level.

<captureMode> → macro.struc-unstrucContent → model.textPhraseLike.limited → <seg>

**<settlement>** Contains the name of a settlement such as a city, town, or village identified as a single geopolitical or administrative unit.

<captureMode> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <settlement>

**<signatures>** Provides a description of the leaf or quire signatures found within a codex.

<captureMode> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.msInLine → <signatures>

**<stack>** An inline table with a single column.

<captureMode> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.rendLike → <stack>

**<stamp>** Contains a word or phrase describing an official mark indicating ownership, genuineness, validity, etc.

<captureMode> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.msInLine → <stamp>

**<street>** full street address including any name or number identifying a building as well as the name of the street or route on which it is located.

<captureMode> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.addressPart → <street>

**<styleName>** A label for a characteristic style of writing or performance, such as 'bebop' or 'rock-n-roll'.

<captureMode> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.nameLike.label → <styleName>

**<symbol>** A reference to a previously defined symbol.

<captureMode> → macro.struc-unstrucContent → model.textPhraseLike.limited → <symbol>

**<term>** Keyword or phrase which describes a resource.

<captureMode> → macro.struc-unstrucContent → model.textPhraseLike.limited → <term>

**<title>** Title of a bibliographic entity.

<captureMode> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.titleLike → <title>

**<watermark>** Contains a description of a watermark or similar device.

<captureMode> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.msInline → <watermark>

**<width>** Description of the horizontal size of an object.

<captureMode> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.dimLike → <width>

## Declaration

```
<elementSpec ident="captureMode" module="MEI.header">
  <gloss versionDate="2022-05-18" xml:lang="en">capture mode</gloss>

## <carrierForm>

(carrier form) – The specific class of material to which the physical carrier of the source/manifestation belongs (e.g., sound cassette, videodisc, microfilm cartridge, transparency, etc.). The carrier for a manifestation comprising multiple physical components may include more than one form (e.g., a filmstrip with an accompanying booklet, a separate sound disc carrying the sound track for a film, etc.).

<carrierForm> → [att.common](#) → [att.linkin](#) → @copyof

**@corresp** (*optional*) Used to point to other elements that correspond to this one in a generic fashion. One or more values from [data.URI](#), separated by spaces.

<carrierForm> → [att.common](#) → [att.linkin](#) → @corresp

**@follows** (*optional*) points to one or more events in a user-defined collection that are known to be predecessors of the current element. One or more values from [data.URI](#), separated by spaces.

<carrierForm> → [att.common](#) → [att.linkin](#) → @follows

**@label** (*optional*) Captures text to be used to generate a label for the element to which it's attached, a "tool tip" or prefatory text, for example. Should not be used to record document content. Value is plain text.

<carrierForm> → [att.common](#) → [att.labelled](#) → @label

**@on** (*optional*) Provides a number-like designation that indicates an element's position in a sequence of similar elements. May not contain space characters. Value conforms to [data.WORD](#).

<carrierForm> → att.common → att.nNumberLike → @n

**@next** (*optional*) Used to point to the next event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<carrierForm> → att.common → att.linked → @next

**@precedes** (*optional*) Points to one or more events in a user-defined collection that are known to be successors of the current element. One or more values from [data.URI](#), separated by spaces.

<carrierForm> → att.common → att.linked → @precedes

**@prev** (*optional*) Points to the previous event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<carrierForm> → att.common → att.linked → @prev

**@resp** (*optional*) Indicates the agent(s) responsible for some aspect of the text's transcription, editing, or encoding. Its value must point to one or more identifiers declared in the document header. One or more values from [data.URI](#), separated by spaces.

<carrierForm> → att.common → att.responsibility → @resp

**@sameas** (*optional*) Points to an element that is the same as the current element but is not a literal copy of the current element. One or more values from [data.URI](#), separated by spaces.

<carrierForm> → att.common → att.linked → @sameas

**@synch** (*optional*) Points to elements that are synchronous with the current element. One or more values from [data.URI](#), separated by spaces.

<carrierForm> → att.common → att.linked → @synch

**@translit** (*optional*) Specifies the transliteration technique used. Value is a [NMTOKEN](#).

<carrierForm> → att.lang → @translit

**@type** (*optional*) Designation which characterizes the element in some sense, using any convenient classification scheme or typology that employs single-token labels. One or more values of datatype [NMTOKEN](#), separated by spaces.

<carrierForm> → att.common → att.typed → @type

**@xml:base** (*optional*) Provides a base URI reference with which applications can resolve relative URI references into absolute URI references. Value conforms to [data.URI](#).

<carrierForm> → att.common → att.basic → @xml:base

**@xml:id** (*optional*) Regularizes the naming of an element and thus facilitates building links between it and other resources. Each id attribute within a document must have a unique value. Value is a valid [xml:id](#).

<carrierForm> → att.common → att.basic → att.id → @xml:id

**@xml:lang** (*optional*) Identifies the language of the element's content. The values for this attribute are language 'tags' as defined in BCP 47. All language tags that make use of private use sub-tags must be documented in a corresponding language element in the MEI header whose id attribute is the same as the language tag's value. Value is a [language](#).

<carrierForm> → att.lang → @xml:lang

## Member of

[model.physDescPart](#) Groups elements that may appear as part of the physical description of a bibliographic item.

**Contained By**

**<physDesc>** Container for information about the appearance, construction, or handling of physical materials, such as their dimension, quantity, color, style, and technique of creation.  
 <carrierForm> → model.physDescPart → <physDesc>

**May Contain**

**<abbr>** A generic element for 1) a shortened form of a word, including an acronym or 2) a shorthand notation.

<carrierForm> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.editorialLike → <abbr>

**<address>** Contains a postal address, for example of a publisher, an organization, or an individual.

<carrierForm> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.addressLike → <address>

**<annot>** Provides a statement explaining the text or indicating the basis for an assertion.

<carrierForm> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.annotLike → <annot>

**<bibl>** Provides a loosely-structured bibliographic citation in which the sub-components may or may not be explicitly marked.

<carrierForm> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.biblLike → <bibl>

**<biblStruct>** Contains a bibliographic citation in which bibliographic sub-elements must appear in a specified order.

<carrierForm> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.biblLike → <biblStruct>

**<bloc>** Contains the name of a geopolitical unit consisting of two or more nation states or countries.

<carrierForm> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <bloc>

**<catchwords>** Describes the system used to ensure correct ordering of the quires making up an item, typically by means of annotations at the foot of the page.

<carrierForm> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.msInline → <catchwords>

**<corpName>** Identifies an organization or group of people that acts as a single entity.

<carrierForm> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.nameLike → model.nameLike.agent → <corpName>

**<country>** Contains the name of a geopolitical unit, such as a nation, country, colony, or commonwealth, larger than or administratively superior to a region and smaller than a bloc.

<carrierForm> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <country>

**<date>** A string identifying a point in time or the time period between two such points.

<carrierForm> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.dateLike → <date>

**<dedicatee>** Entity to whom a creative work is formally offered.

<carrierForm> → macro.struc-unstrucContent → model.textPhraseLike.limited → <dedicatee>

**<depth>** Description of a measurement taken through a three-dimensional object.

<carrierForm> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.dimLike → <depth>

**<dim>** Any single dimensional specification.

<carrierForm> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.dimLike → <dim>

**<dimensions>** Information about the physical size of an entity; usually includes numerical data.

<carrierForm> → macro.struc-unstrucContent → model.textPhraseLike.limited → <dimensions>

**<district>** Contains the name of any kind of subdivision of a settlement, such as a parish, ward, or other administrative or geographic unit.

<carrierForm> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <district>

**<expan>** Contains the expansion of an abbreviation.

<carrierForm> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.editorialLike → <expan>

**<extent>** Used to express size in terms other than physical dimensions, such as number of pages, records, bytes, physical components, etc.

<carrierForm> → macro.struc-unstrucContent → model.textPhraseLike.limited → <extent>

**<fig>** Groups elements representing or containing graphic information such as an illustration or figure.

<carrierForm> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.figureLike → <fig>

**<geogFeat>** Contains a common noun identifying a geographical feature.

<carrierForm> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <geogFeat>

**<geogName>** The proper noun designation for a place, natural feature, or political jurisdiction.

<carrierForm> → macro.struc-  
unstrucContent → model.textPhraseLike.limited → model.nameLike → model.nameLike.place → model.nameLike.geogName → <geogName>

**<head>** Contains any heading, for example, the title of a section of text, or the heading of a list.

<carrierForm> → macro.struc-unstrucContent → model.headLike → <head>

**<height>** Description of the vertical size of an object.

<carrierForm> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.dimLike → <height>

**<heraldry>** Contains a heraldic formula or phrase, typically found as part of a blazon, coat of arms, etc.

<carrierForm> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.msInline → <heraldry>

**<identifier>** An alpha-numeric string that establishes the identity of the described material.

<carrierForm> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.identifierLike → <identifier>

**<lb>** An empty formatting element that forces text to begin on a new line.

<carrierForm> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.lbLike → <lb>

**<locus>** Defines a location within a manuscript or manuscript component, usually as a (possibly discontinuous) sequence of folio references.

<carrierForm> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.msInline → <locus>

**<locusGrp>** Groups locations which together form a distinct but discontinuous item within a manuscript or manuscript part, according to a specific foliation.

<carrierForm> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.msInline → <locusGrp>

**<name>** Proper noun or noun phrase.

<carrierForm> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.nameLike → <name>

**<num>** Numeric information in any form.

<carrierForm> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.measurementLike → model.numLike → <num>

**<p>** One or more text phrases that form a logical prose passage.

<carrierForm> → macro.struc-unstrucContent → model.pLike → <p>

**<periodName>** A label that describes a period of time, such as 'Baroque' or '3rd Style period'.

<carrierForm> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.nameLike.label → <periodName>

**<persName>** Designation for an individual, including any or all of that individual's forenames, surnames, honorific titles, and added names.

<carrierForm> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.nameLike → model.nameLike.agent → <persName>

**<postBox>** (postal box or post office box) contains a number or other identifier for some postal delivery point other than a street address.

<carrierForm> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.addressPart → <postBox>

**<postCode>** (postal code) contains a numerical or alphanumeric code used as part of a postal address to simplify sorting or delivery of mail.

<carrierForm> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.addressPart → <postCode>

**<ptr>** Defines a traversible pointer to another location, using only attributes to describe the destination.

<carrierForm> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.locrefLike → <ptr>

**<q>** Contains material which is distinguished from the surrounding phrase-level text using quotation marks or a similar method. Use <quote> for block-level quotations.

<carrierForm> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.qLike → <q>

**<ref>** Defines a traversible reference to another location. May contain text and sub-elements that describe the destination.

<carrierForm> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.locrefLike → <ref>

**<region>** Contains the name of an administrative unit such as a state, province, or county, larger than a settlement, but smaller than a country.

<carrierForm> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <region>

**<relation>** Describes a relationship or linkage amongst entities.

<carrierForm> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.relationLike → <relation>

**<relationList>** Gathers relation elements.

<carrierForm> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.relationLike → <relationList>

**<rend>** A formatting element indicating special visual rendering, e.g., bold or italicized, of a text word or phrase.

<carrierForm> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.rendLike → <rend>

**<repository>** Institution, agency, or individual which holds a bibliographic item.

<carrierForm> → macro.struc-

unstrucContent → model.textPhraseLike.limited → model.nameLike → model.nameLike.place → model.repositoryLike → <repository>

**<secFolio>** Marks the word or words taken from a fixed point in a codex (typically the beginning of the second leaf) in order to provide a unique identifier for the item.

<carrierForm> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.msInline → <secFolio>

**<seg>** (arbitrary segment) represents any segmentation of text below the "text component" level.

<carrierForm> → macro.struc-unstrucContent → model.textPhraseLike.limited → <seg>

**<settlement>** Contains the name of a settlement such as a city, town, or village identified as a single geopolitical or administrative unit.

<carrierForm> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <settlement>

**<signatures>** Provides a description of the leaf or quire signatures found within a codex.

<carrierForm> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.msInline → <signatures>

**<stack>** An inline table with a single column.

<carrierForm> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.rendLike → <stack>

**<stamp>** Contains a word or phrase describing an official mark indicating ownership, genuineness, validity, etc.

<carrierForm> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.msInline → <stamp>

**<street>** full street address including any name or number identifying a building as well as the name of the street or route on which it is located.

<carrierForm> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.addressPart → <street>

**<styleName>** A label for a characteristic style of writing or performance, such as 'bebop' or 'rock-n-roll'.

<carrierForm> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.nameLike.label → <styleName>

**<symbol>** A reference to a previously defined symbol.

<carrierForm> → macro.struc-unstrucContent → model.textPhraseLike.limited → <symbol>

**<term>** Keyword or phrase which describes a resource.

<carrierForm> → macro.struc-unstrucContent → model.textPhraseLike.limited → <term>

**<title>** Title of a bibliographic entity.

<carrierForm> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.titleLike → <title>

**<watermark>** Contains a description of a watermark or similar device.

<carrierForm> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.msInline → <watermark>

**<width>** Description of the horizontal size of an object.

<carrierForm> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.dimLike → <width>

## <castGrp>

(cast group) – Groups one or more individual castItem elements within a cast list.

### Referenced in chapters

[3.6.7.1 Cast Lists](#)

### Module

[MEI.shared](#)

### Attributes

**@class** (*optional*) Contains one or more URIs which denote classification terms that apply to the entity bearing this attribute. One or more values from [data.URI](#), separated by spaces.

<castGrp> → att.common → att.typed → att.classed → @class

**@copyof** (*optional*) Points to an element of which the current element is a copy. Value conforms to [data.URI](#).

<castGrp> → att.common → att.linking → @copyof

**@corresp** (*optional*) Used to point to other elements that correspond to this one in a generic fashion. One or more values from [data.URI](#), separated by spaces.

<castGrp> → att.common → att.linking → @corresp

**@facs** (*optional*) Points to one or more images, portions of an image, or surfaces which correspond to the current element. One or more values from [data.URI](#), separated by spaces.

<castGrp> → att.facsimile → @facs

**@follows** (*optional*) points to one or more events in a user-defined collection that are known to be predecessors of the current element. One or more values from [data.URI](#), separated by spaces.

<castGrp> → att.common → att.linking → @follows

**@label** (*optional*) Captures text to be used to generate a label for the element to which it's attached, a "tool tip" or prefatory text, for example. Should not be used to record document content. Value is plain text.

<castGrp> → att.common → att.labelled → @label

**@n** (*optional*) Provides a number-like designation that indicates an element's position in a sequence of similar elements. May not contain space characters. Value conforms to [data.WORD](#).

<castGrp> → att.common → att.nNumberLike → @n

**@next** (*optional*) Used to point to the next event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<castGrp> → att.common → att.linking → @next

**@precedes** (*optional*) Points to one or more events in a user-defined collection that are known to be successors of the current element. One or more values from [data.URI](#), separated by spaces.

<castGrp> → att.common → att.linking → @precedes

**@prev** (*optional*) Points to the previous event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<castGrp> → att.common → att.linking → @prev

**@resp** (*optional*) Indicates the agent(s) responsible for some aspect of the text's transcription, editing, or encoding. Its value must point to one or more identifiers declared in the document header. One or more values from [data.URI](#), separated by spaces.

<castGrp> → att.common → att.responsibility → @resp

**@sameas** (*optional*) Points to an element that is the same as the current element but is not a literal copy of the current element. One or more values from [data.URI](#), separated by spaces.

<castGrp> → att.common → att.linked → @sameas

**@synch** (*optional*) Points to elements that are synchronous with the current element. One or more values from [data.URI](#), separated by spaces.

<castGrp> → att.common → att.linked → @synch

**@translit** (*optional*) Specifies the transliteration technique used. Value is a [NMOKEN](#).

<castGrp> → att.lang → @translit

**@type** (*optional*) Designation which characterizes the element in some sense, using any convenient classification scheme or typology that employs single-token labels. One or more values of datatype [NMOKEN](#), separated by spaces.

<castGrp> → att.common → att.typed → @type

**@xml:base** (*optional*) Provides a base URI reference with which applications can resolve relative URI references into absolute URI references. Value conforms to [data.URI](#).

<castGrp> → att.common → att.basic → @xml:base

**@xml:id** (*optional*) Regularizes the naming of an element and thus facilitates building links between it and other resources. Each id attribute within a document must have a unique value. Value is a valid [xml:id](#).

<castGrp> → att.common → att.basic → att.id → @xml:id

**@xml:lang** (*optional*) Identifies the language of the element's content. The values for this attribute are language 'tags' as defined in BCP 47. All language tags that make use of private use sub-tags must be documented in a corresponding language element in the MEI header whose id attribute is the same as the language tag's value. Value is a [language](#).

<castGrp> → att.lang → @xml:lang

## Member of

(castGrp isn't member of any model class)

## Contained By

**<castGrp>** Groups one or more individual castItem elements within a cast list.

<castGrp> → elements having castGrp as direct children → <castGrp>

**<castList>** Contains a single cast list or dramatis personae.

<castGrp> → elements having castGrp as direct children → <castList>

## May Contain

**<castGrp>** Groups one or more individual castItem elements within a cast list.

<castGrp> → direct children → <castGrp>

**<castItem>** Contains a single entry within a cast list, describing either a single role or a list of non-speaking roles.

<castGrp> → direct children → <castItem>

**<roleDesc>** Describes a character's role in a drama.

<castGrp> → direct children → <roleDesc>

## Remarks

The model of this element is based on the [castGroup](#) element of the Text Encoding Initiative (TEI).

## <castItem>

Contains a single entry within a cast list, describing either a single role or a list of non-speaking roles.

### Referenced in chapters

[3.6.7.1 Cast Lists](#)

### Module

[MEI.shared](#)

### Attributes

**@analog** (*optional*) Contains a reference to a field or element in another descriptive encoding system to which this MEI element is comparable. Value is plain text.

<castItem> → [att.bibl](#) → @analog

**@class** (*optional*) Contains one or more URIs which denote classification terms that apply to the entity bearing this attribute. One or more values from [data.URI](#), separated by spaces.

<castItem> → [att.common](#) → [att.typed](#) → [att.classed](#) → @class

**@copyof** (*optional*) Points to an element of which the current element is a copy. Value conforms to [data.URI](#).

<castItem> → [att.common](#) → [att.linking](#) → @copyof

**@corresp** (*optional*) Used to point to other elements that correspond to this one in a generic fashion. One or more values from [data.URI](#), separated by spaces.

<castItem> → [att.common](#) → [att.linking](#) → @corresp

**@facs** (*optional*) Points to one or more images, portions of an image, or surfaces which correspond to the current element. One or more values from [data.URI](#), separated by spaces.

<castItem> → [att.facsimile](#) → @facs

**@follows** (*optional*) points to one or more events in a user-defined collection that are known to be predecessors of the current element. One or more values from [data.URI](#), separated by spaces.

<castItem> → [att.common](#) → [att.linking](#) → @follows

**@label** (*optional*) Captures text to be used to generate a label for the element to which it's attached, a "tool tip" or prefatory text, for example. Should not be used to record document content. Value is plain text.

<castItem> → [att.common](#) → [att.labelled](#) → @label

**@n** (*optional*) Provides a number-like designation that indicates an element's position in a sequence of similar elements. May not contain space characters. Value conforms to [data.WORD](#).

<castItem> → [att.common](#) → [att.nNumberLike](#) → @n

**@next** (*optional*) Used to point to the next event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<castItem> → [att.common](#) → [att.linking](#) → @next

**@precedes** (*optional*) Points to one or more events in a user-defined collection that are known to be successors of the current element. One or more values from [data.URI](#), separated by spaces.

<castItem> → [att.common](#) → [att.linking](#) → @precedes

**@prev** (*optional*) Points to the previous event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<castItem> → [att.common](#) → [att.linking](#) → @prev

**@resp** (*optional*) Indicates the agent(s) responsible for some aspect of the text's transcription, editing, or encoding. Its value must point to one or more identifiers declared in the document header. One or more values from [data.URI](#), separated by spaces.

<castItem> → [att.common](#) → [att.responsibility](#) → @resp

**@sameas** (*optional*) Points to an element that is the same as the current element but is not a literal copy of the current element. One or more values from [data.URI](#), separated by spaces.

<castItem> → [att.common](#) → [att.linking](#) → @sameas

**@synch** (*optional*) Points to elements that are synchronous with the current element. One or more values from [data.URI](#), separated by spaces.

<castItem> → [att.common](#) → [att.linking](#) → @synch

**@translit** (*optional*) Specifies the transliteration technique used. Value is a [NMTOKEN](#).

<castItem> → [att.lang](#) → @translit

**@type** (*optional*) Designation which characterizes the element in some sense, using any convenient classification scheme or typology that employs single-token labels. One or more values of datatype [NMTOKEN](#), separated by spaces.

<castItem> → [att.common](#) → [att.typed](#) → @type

**@xml:base** (*optional*) Provides a base URI reference with which applications can resolve relative URI references into absolute URI references. Value conforms to [data.URI](#).

<castItem> → [att.common](#) → [att.basic](#) → @xml:base

**@xml:id** (*optional*) Regularizes the naming of an element and thus facilitates building links between it and other resources. Each id attribute within a document must have a unique value. Value is a valid [xml:id](#).

<castItem> → [att.common](#) → [att.basic](#) → [att.id](#) → @xml:id

**@xml:lang** (*optional*) Identifies the language of the element's content. The values for this attribute are language 'tags' as defined in BCP 47. All language tags that make use of private use sub-tags must be documented in a corresponding language element in the MEI header whose id attribute is the same as the language tag's value. Value is a [language](#).

<castItem> → [att.lang](#) → @xml:lang

## Member of

(castItem isn't member of any model class)

## Contained By

**<castGrp>** Groups one or more individual castItem elements within a cast list.

<castItem> → elements having castItem as direct children → <castGrp>

**<castList>** Contains a single cast list or dramatis personae.

<castItem> → elements having castItem as direct children → <castList>

## May Contain

**<actor>** Name of an actor appearing within a cast list.

<castItem> → direct children → <actor>

**<perfRes>** Name of an instrument on which a performer plays, a performer's voice range, or a standard performing ensemble designation.

<castItem> → direct children → <perfRes>

**<role>** Name of a dramatic role, as given in a cast list.

<castItem> → direct children → <role>

**<roleDesc>** Describes a character's role in a drama.

<castItem> → direct children → <roleDesc>

## Remarks

The model of this element is based on the [castItem](#) element of the Text Encoding Initiative (TEI).

## Declaration

## <castList>

Contains a single cast list or dramatis personae.

### Referenced in chapters

[3.6.7 Performance Medium](#), [3.6.7.1 Cast Lists](#)

### Module

[MEI.shared](#)

### Attributes

**@analog** (*optional*) Contains a reference to a field or element in another descriptive encoding system to which this MEI element is comparable. Value is plain text.

<castList> → [att.bibl](#) → @analog

**@class** (*optional*) Contains one or more URIs which denote classification terms that apply to the entity bearing this attribute. One or more values from [data.URI](#), separated by spaces.

<castList> → [att.common](#) → [att.typed](#) → [att.classed](#) → @class

**@copyof** (*optional*) Points to an element of which the current element is a copy. Value conforms to [data.URI](#).

<castList> → [att.common](#) → [att.linkin](#) → @copyof

**@corresp** (*optional*) Used to point to other elements that correspond to this one in a generic fashion. One or more values from [data.URI](#), separated by spaces.

<castList> → [att.common](#) → [att.linkin](#) → @corresp

**@facs** (*optional*) Points to one or more images, portions of an image, or surfaces which correspond to the current element. One or more values from [data.URI](#), separated by spaces.

<castList> → [att.facsimile](#) → @facs

**@follows** (*optional*) points to one or more events in a user-defined collection that are known to be predecessors of the current element. One or more values from [data.URI](#), separated by spaces.

<castList> → [att.common](#) → [att.linkin](#) → @follows

**@label** (*optional*) Captures text to be used to generate a label for the element to which it's attached, a "tool tip" or prefatory text, for example. Should not be used to record document content. Value is plain text.

<castList> → [att.common](#) → [att.labelled](#) → @label

**@n** (*optional*) Provides a number-like designation that indicates an element's position in a sequence of similar elements. May not contain space characters. Value conforms to [data.WORD](#).

<castList> → [att.common](#) → [att.nNumberLike](#) → @n

**@next** (*optional*) Used to point to the next event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<castList> → [att.common](#) → [att.linkin](#) → @next

**@precedes** (*optional*) Points to one or more events in a user-defined collection that are known to be successors of the current element. One or more values from [data.URI](#), separated by spaces.

<castList> → [att.common](#) → [att.linkin](#) → @precedes

**@prev** (*optional*) Points to the previous event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<castList> → [att.common](#) → [att.linking](#) → @prev

**@resp** (*optional*) Indicates the agent(s) responsible for some aspect of the text's transcription, editing, or encoding. Its value must point to one or more identifiers declared in the document header. One or more values from [data.URI](#), separated by spaces.

<castList> → [att.common](#) → [att.responsibility](#) → @resp

**@sameas** (*optional*) Points to an element that is the same as the current element but is not a literal copy of the current element. One or more values from [data.URI](#), separated by spaces.

<castList> → [att.common](#) → [att.linking](#) → @sameas

**@synch** (*optional*) Points to elements that are synchronous with the current element. One or more values from [data.URI](#), separated by spaces.

<castList> → [att.common](#) → [att.linking](#) → @synch

**@translit** (*optional*) Specifies the transliteration technique used. Value is a [NMTOKEN](#).

<castList> → [att.lang](#) → @translit

**@type** (*optional*) Designation which characterizes the element in some sense, using any convenient classification scheme or typology that employs single-token labels. One or more values of datatype [NMTOKEN](#), separated by spaces.

<castList> → [att.common](#) → [att.typed](#) → @type

**@xml:base** (*optional*) Provides a base URI reference with which applications can resolve relative URI references into absolute URI references. Value conforms to [data.URI](#).

<castList> → [att.common](#) → [att.basic](#) → @xml:base

**@xml:id** (*optional*) Regularizes the naming of an element and thus facilitates building links between it and other resources. Each id attribute within a document must have a unique value. Value is a valid [xml:id](#).

<castList> → [att.common](#) → [att.basic](#) → [att.id](#) → @xml:id

**@xml:lang** (*optional*) Identifies the language of the element's content. The values for this attribute are language 'tags' as defined in BCP 47. All language tags that make use of private use sub-tags must be documented in a corresponding language element in the MEI header whose id attribute is the same as the language tag's value. Value is a [language](#).

<castList> → [att.lang](#) → @xml:lang

## Member of

[model.listLike](#) Groups list-like elements.

## Contained By

**<abbr>** A generic element for 1) a shortened form of a word, including an acronym or 2) a shorthand notation.

<castList> → [model.listLike](#) → [model.textComponentLike](#) → [model.editTransPart.text](#) → [model.editTransPart](#) → <abbr>

**<add>** Marks an addition to the text.

<castList> → [model.listLike](#) → [model.textComponentLike](#) → [model.editTransPart.text](#) → [model.editTransPart](#) → <add>

**<annot>** Provides a statement explaining the text or indicating the basis for an assertion.

<castList> → [model.listLike](#) → [model.textComponentLike](#) → <annot>

**<argument>** Contains a formal list or prose description of topics addressed.

<castList> → model.listLike → model.textComponentLike → <argument>

**<corr>** Contains the correct form of an apparent erroneous passage.

<castList> → model.listLike → model.textComponentLike → model.editTransPart.text → model.editTransPart → <corr>

**<damage>** Contains an area of damage to the physical medium.

<castList> → model.listLike → model.textComponentLike → model.editTransPart.text → model.editTransPart → <damage>

**<dedication>** Contains a dedicatory statement.

<castList> → model.listLike → model.textComponentLike → <dedication>

**<del>** Contains information deleted, marked as deleted, or otherwise indicated as superfluous or spurious in the copy text by an author, scribe, annotator, or corrector.

<castList> → model.listLike → model.textComponentLike → model.editTransPart.text → model.editTransPart → <del>

**<div>** Major structural division of text, such as a preface, chapter or section.

<castList> → model.listLike → model.textComponentLike → <div>

**<epigraph>** Contains a quotation, anonymous or attributed, appearing on a title page.

<castList> → model.listLike → model.paracontentPart → <epigraph>

**<event>** Contains a free-text event description.

<castList> → elements having castList as direct children → <event>

**<expan>** Contains the expansion of an abbreviation.

<castList> → model.listLike → model.textComponentLike → model.editTransPart.text → model.editTransPart → <expan>

**<figDesc>** Contains a brief prose description of the appearance or content of a graphic figure, for use when documenting an image without displaying it.

<castList> → model.listLike → model.textComponentLike → <figDesc>

**<history>** Provides a container for information about the history of a resource other than the circumstances of its creation.

<castList> → model.listLike → model.textComponentLike → <history>

**<imprimatur>** Contains a formal statement authorizing the publication of a work, sometimes required to appear on a title page or its verso.

<castList> → model.listLike → model.paracontentPart → <imprimatur>

**<lem>** (lemma) – Contains the lemma, or base text, of a textual variation.

<castList> → model.listLike → model.textComponentLike → model.rdgPart.text → model.rdgPart → <lem>

**<li>** Single item in a <list>.

<castList> → model.listLike → model.textComponentLike → <li>

**<orig>** Contains material which is marked as following the original, rather than being normalized or corrected.

<castList> → model.listLike → model.textComponentLike → model.editTransPart.text → model.editTransPart → <orig>

**<p>** One or more text phrases that form a logical prose passage.

<castList> → model.listLike → model.paracontentPart → <p>

**<perfMedium>** Indicates the number and character of the performing forces used in a musical composition.

<castList> → elements having castList as direct children → <perfMedium>

**<pgDesc>** Contains a brief prose description of the appearance or description of the content of a physical page.

<castList> → model.listLike → model.textComponentLike → <pgDesc>

**<pgFoot>** A running footer.

<castList> → model.listLike → model.textComponentLike → <pgFoot>

**<pgHead>** A running header.

<castList> → model.listLike → model.textComponentLike → <pgHead>

**<quote>** Contains a paragraph-like block of text attributed to an external source, normally set off from the surrounding text by spacing or other typographic distinction.

<castList> → model.listLike → model.paracontentPart → <quote>

**<rdg>** (reading) – Contains a single reading within a textual variation.

<castList> → model.listLike → model.textComponentLike → model.rdgPart.text → model.rdgPart → <rdg>

**<reg>** Contains material which has been regularized or normalized in some sense.

<castList> → model.listLike → model.textComponentLike → model.editTransPart.text → model.editTransPart → <reg>

**<restore>** Indicates restoration of material to an earlier state by cancellation of an editorial or authorial marking or instruction.

<castList> → model.listLike → model.textComponentLike → model.editTransPart.text → model.editTransPart → <restore>

**<sic>** Contains apparently incorrect or inaccurate material.

<castList> → model.listLike → model.textComponentLike → model.editTransPart.text → model.editTransPart → <sic>

**<supplied>** Contains material supplied by the transcriber or editor for any reason.

<castList> → model.listLike → model.textComponentLike → model.editTransPart.text → model.editTransPart → <supplied>

**<td>** Designates a table cell that contains data as opposed to a cell that contains column or row heading information.

<castList> → model.listLike → model.textComponentLike → <td>

**<th>** Designates a table cell containing column or row heading information as opposed to one containing data.

<castList> → model.listLike → model.textComponentLike → <th>

**<titlePage>** Contains a transcription of the title page of a text.

<castList> → model.listLike → model.textComponentLike → <titlePage>

**<unclear>** Contains material that cannot be transcribed with certainty because it is illegible or inaudible in the source.

<castList> → model.listLike → model.textComponentLike → model.editTransPart.text → model.editTransPart → <unclear>

## May Contain

**<castGrp>** Groups one or more individual castItem elements within a cast list.

<castList> → direct children → <castGrp>

**<castItem>** Contains a single entry within a cast list, describing either a single role or a list of non-speaking roles.

<castList> → direct children → <castItem>

**<head>** Contains any heading, for example, the title of a section of text, or the heading of a list.

<castList> → model.headLike → <head>

## Remarks

The model of this element is based on the [castList](#) element of the Text Encoding Initiative (TEI).

## Declaration

```

## <catRel>

(category relationship) – Contains the name of a related category.

### Module

[MEI.header](#)

### Attributes

**@analog** (*optional*) Contains a reference to a field or element in another descriptive encoding system to which this MEI element is comparable. Value is plain text.

<catRel> → [att.bibl](#) → @analog

**@auth** (*optional*) A name or label associated with a controlled vocabulary or other authoritative source for this element or its content. Value is plain text.

<catRel> → [att.authorized](#) → @auth

**@auth.uri** (*optional*) A web-accessible location of the controlled vocabulary or other authoritative source of identification or definition for this element or its content. This attribute may contain a complete URI or a partial URI which is completed by the value of the codedval attribute. Value conforms to [data.URI](#).  
<catRel> → [att.authorized](#) → @auth.uri

**@codedval** (*optional*) A value that represents or identifies other data. Often, it is a primary key in the database or a unique value in the coded list identified by the auth or auth.uri attributes. One or more values of datatype **NMTOKEN**, separated by spaces.

<catRel> → [att.authorized](#) → [att.canonical](#) → @codedval

**@copyof** (*optional*) Points to an element of which the current element is a copy. Value conforms to [data.URI](#).

<catRel> → [att.linkin](#) → @copyof

**@corresp** (*optional*) Used to point to other elements that correspond to this one in a generic fashion. One or more values from [data.URI](#), separated by spaces.

<catRel> → [att.linkin](#) → @corresp

**@follows** (*optional*) points to one or more events in a user-defined collection that are known to be predecessors of the current element. One or more values from [data.URI](#), separated by spaces.

<catRel> → [att.linkin](#) → @follows

**@label** (*optional*) Captures text to be used to generate a label for the element to which it's attached, a "tool tip" or prefatory text, for example. Should not be used to record document content. Value is plain text.

<catRel> → [att.labelled](#) → @label

**@n** (*optional*) Provides a number-like designation that indicates an element's position in a sequence of similar elements. May not contain space characters. Value conforms to [data.WORD](#).

<catRel> → [att.nNumberLike](#) → @n

**@next** (*optional*) Used to point to the next event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<catRel> → [att.linkin](#) → @next

**@precedes** (*optional*) Points to one or more events in a user-defined collection that are known to be successors of the current element. One or more values from [data.URI](#), separated by spaces.

<catRel> → att.linkng → @precedes

**@prev** (optional) Points to the previous event(s) in a user-defined collection. One or more values from data.URI, separated by spaces.

<catRel> → att.linkng → @prev

**@resp** (optional) Indicates the agent(s) responsible for some aspect of the text's transcription, editing, or encoding. Its value must point to one or more identifiers declared in the document header. One or more values from data.URI, separated by spaces.

<catRel> → att.responsibility → @resp

**@sameas** (optional) Points to an element that is the same as the current element but is not a literal copy of the current element. One or more values from data.URI, separated by spaces.

<catRel> → att.linkng → @sameas

**@synch** (optional) Points to elements that are synchronous with the current element. One or more values from data.URI, separated by spaces.

<catRel> → att.linkng → @synch

**@type** (required) Provides a description of the relationship between the current and the target categories. Allowed values are: "**broader**" (*Category to which the current category is hierarchically subordinate.*), "**narrower**" (*Category which is hierarchically subordinate to the current category.*), "**related**" (*Category that is associatively but not hierarchically linked to the current category.*), "**usefor**" (*Non-preferred category; often a synonym or near-synonym for the preferred category label.*)

<catRel> → direct children → @type

**@xml:base** (optional) Provides a base URI reference with which applications can resolve relative URI references into absolute URI references. Value conforms to data.URI.

<catRel> → att.basic → @xml:base

**@xml:id** (optional) Regularizes the naming of an element and thus facilitates building links between it and other resources. Each id attribute within a document must have a unique value. Value is a valid xml:id.

<catRel> → att.basic → att.id → @xml:id

## Member of

(catRel isn't member of any model class)

## Contained By

**<category>** Contains an individual descriptive category in a user-defined taxonomy, possibly nested within a superordinate category.

<catRel> → elements having catRel as direct children → <category>

## May Contain

**<desc>** Container for text that briefly describes the feature to which it is attached, including its intended usage, purpose, or application as appropriate.

<catRel> → direct children → <desc>

**<label>** A container for document text that identifies the feature to which it is attached. For a "tool tip" or other generated label, use the label attribute.

<catRel> → direct children → <label>

## Declaration

```

<elementSpec ident="catRel" module="MEI.header">

DEVELOPMENT  
VERSION

## <catchwords>

Describes the system used to ensure correct ordering of the quires making up an item, typically by means of annotations at the foot of the page.

### Module

[MEI.msDesc](#)

### Attributes

**@analog** (*optional*) Contains a reference to a field or element in another descriptive encoding system to which this MEI element is comparable. Value is plain text.

<catchwords> → [att.bibl](#) → @analog

**@class** (*optional*) Contains one or more URIs which denote classification terms that apply to the entity bearing this attribute. One or more values from [data.URI](#), separated by spaces.

<catchwords> → [att.common](#) → [att.typed](#) → [att.classe](#) → @class

**@copyof** (*optional*) Points to an element of which the current element is a copy. Value conforms to [data.URI](#).

<catchwords> → [att.common](#) → [att.linking](#) → @copyof

**@corresp** (*optional*) Used to point to other elements that correspond to this one in a generic fashion. One or more values from [data.URI](#), separated by spaces.

<catchwords> → [att.common](#) → [att.linking](#) → @corresp

**@follows** (*optional*) points to one or more events in a user-defined collection that are known to be predecessors of the current element. One or more values from [data.URI](#), separated by spaces.

<catchwords> → [att.common](#) → [att.linking](#) → @follows

**@label** (*optional*) Captures text to be used to generate a label for the element to which it's attached, a "tool tip" or prefatory text, for example. Should not be used to record document content. Value is plain text.

<catchwords> → [att.common](#) → [att.labelled](#) → @label

**@n** (*optional*) Provides a number-like designation that indicates an element's position in a sequence of similar elements. May not contain space characters. Value conforms to [data.WORD](#).

<catchwords> → [att.common](#) → [att.nNumberLike](#) → @n

**@next** (*optional*) Used to point to the next event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<catchwords> → [att.common](#) → [att.linking](#) → @next

**@precedes** (*optional*) Points to one or more events in a user-defined collection that are known to be successors of the current element. One or more values from [data.URI](#), separated by spaces.

<catchwords> → [att.common](#) → [att.linking](#) → @precedes

**@prev** (*optional*) Points to the previous event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<catchwords> → [att.common](#) → [att.linking](#) → @prev

**@resp** (*optional*) Indicates the agent(s) responsible for some aspect of the text's transcription, editing, or encoding. Its value must point to one or more identifiers declared in the document header. One or more values from [data.URI](#), separated by spaces.

<catchwords> → att.common → att.responsibility → @resp

**@sameas** (*optional*) Points to an element that is the same as the current element but is not a literal copy of the current element. One or more values from [data.URI](#), separated by spaces.

<catchwords> → att.common → att.linking → @sameas

**@synch** (*optional*) Points to elements that are synchronous with the current element. One or more values from [data.URI](#), separated by spaces.

<catchwords> → att.common → att.linking → @synch

**@translit** (*optional*) Specifies the transliteration technique used. Value is a [NMOKEN](#).

<catchwords> → att.lang → @translit

**@type** (*optional*) Designation which characterizes the element in some sense, using any convenient classification scheme or typology that employs single-token labels. One or more values of datatype [NMOKEN](#), separated by spaces.

<catchwords> → att.common → att.typed → @type

**@xml:base** (*optional*) Provides a base URI reference with which applications can resolve relative URI references into absolute URI references. Value conforms to [data.URI](#).

<catchwords> → att.common → att.basic → @xml:base

**@xml:id** (*optional*) Regularizes the naming of an element and thus facilitates building links between it and other resources. Each id attribute within a document must have a unique value. Value is a valid [xml:id](#).

<catchwords> → att.common → att.basic → att.id → @xml:id

**@xml:lang** (*optional*) Identifies the language of the element's content. The values for this attribute are language 'tags' as defined in BCP 47. All language tags that make use of private use sub-tags must be documented in a corresponding language element in the MEI header whose id attribute is the same as the language tag's value. Value is a [language](#).

<catchwords> → att.lang → @xml:lang

## Member of

[model.msInline](#) Groups elements that may appear inline when the msdesc module is active.

[model.physDescPart](#) Groups elements that may appear as part of the physical description of a bibliographic item.

## Contained By

**<abbr>** A generic element for 1) a shortened form of a word, including an acronym or 2) a shorthand notation.

<catchwords> → model.msinline → model.textPhraseLike.limited → model.editTransPart.text → model.editTransPart → <abbr>

**<acquisition>** Records information concerning the process by which an item was acquired by the holding institution.

<catchwords> → model.msinline → model.textPhraseLike.limited → <acquisition>

**<actor>** Name of an actor appearing within a cast list.

<catchwords> → model.msinline → model.textPhraseLike.limited → <actor>

**<add>** Marks an addition to the text.

<catchwords> → model.msinline → model.textPhraseLike.limited → model.editTransPart.text → model.editTransPart → <add>

**<addName>** Contains an additional name component, such as a nickname, epithet, or alias, or any other descriptive phrase used within a personal name.

<catchwords> → model.msInline → model.textPhraseLike.limited → model.textPhraseLike → <addName>

**<addrLine>** Single line of a postal address.

<catchwords> → model.msInline → model.textPhraseLike.limited → model.textPhraseLike → <addrLine>

**<anchoredText>** Container for text that is fixed to a particular page location, regardless of changes made to the layout of the measures around it.

<catchwords> → model.msInline → model.textPhraseLike.limited → <anchoredText>

**<annot>** Provides a statement explaining the text or indicating the basis for an assertion.

<catchwords> → model.msInline → model.textPhraseLike.limited → model.textPhraseLike → <annot>

**<arranger>** A person or organization who transcribes a musical composition, usually for a different medium from that of the original; in an arrangement the musical substance remains essentially unchanged.

<catchwords> → model.msInline → model.textPhraseLike.limited → <arranger>

**<attacca>** An instruction to begin the next section or movement of a composition without pause.

<catchwords> → model.msInline → model.textPhraseLike.limited → <attacca>

**<author>** The name of the creator of the intellectual content of a non-musical, literary work.

<catchwords> → model.msInline → model.textPhraseLike.limited → <author>

**<bibl>** Provides a loosely-structured bibliographic citation in which the sub-components may or may not be explicitly marked.

<catchwords> → model.msInline → model.textPhraseLike.limited → model.textPhraseLike → <bibl>

**<biblScope>** Defines the scope of a bibliographic reference, for example as a list of page numbers, or a named subdivision of a larger work.

<catchwords> → model.msInline → model.textPhraseLike.limited → <biblScope>

**<bindingDesc>** Describes the present and former bindings of an item.

<catchwords> → model.msInline → model.textPhraseLike.limited → <bindingDesc>

**<bloc>** Contains the name of a geopolitical unit consisting of two or more nation states or countries.

<catchwords> → model.msInline → model.textPhraseLike.limited → model.textPhraseLike → <bloc>

**<bracketSpan>** Marks a sequence of notational events grouped by a bracket.

<catchwords> → model.msInline → model.textPhraseLike.limited → <bracketSpan>

**<byline>** Contains the primary statement of responsibility given for a work on its title page.

<catchwords> → model.msInline → model.textPhraseLike.limited → <byline>

**<caption>** A label which accompanies an illustration or a table.

<catchwords> → model.msInline → model.textPhraseLike.limited → model.textPhraseLike → <caption>

**<composer>** The name of the creator of the intellectual content of a musical work.

<catchwords> → model.msInline → model.textPhraseLike.limited → <composer>

**<contentItem>** Contains a single entry within a content description element.

<catchwords> → model.msInline → model.textPhraseLike.limited → model.textPhraseLike → <contentItem>

**<contributor>** Names of individuals, institutions, or organizations responsible for contributions to the intellectual content of a work, where the specialized elements for authors, editors, etc. do not suffice or do not apply.

<catchwords> → model.msInline → model.textPhraseLike.limited → <contributor>

**<corpName>** Identifies an organization or group of people that acts as a single entity.

<catchwords> → model.msInline → model.textPhraseLike.limited → model.textPhraseLike → <corpName>

**<corr>** Contains the correct form of an apparent erroneous passage.

<catchwords> → model.msInline → model.textPhraseLike.limited → model.editTransPart.text → model.editTransPart → <corr>

**<country>** Contains the name of a geopolitical unit, such as a nation, country, colony, or commonwealth, larger than or administratively superior to a region and smaller than a bloc.

<catchwords> → model.msInline → model.textPhraseLike.limited → model.textPhraseLike → <country>

**<cpMark>** A verbal or graphical indication to copy musical material written elsewhere.

<catchwords> → model.msInline → model.textPhraseLike.limited → <cpMark>

**<creation>** Non-bibliographic details of the creation of an intellectual entity, in narrative form, such as the date, place, and circumstances of its composition. More detailed information may be captured within the history element.

<catchwords> → model.msInline → model.textPhraseLike.limited → <creation>

**<damage>** Contains an area of damage to the physical medium.

<catchwords> → model.msInline → model.textPhraseLike.limited → model.editTransPart.text → model.editTransPart → <damage>

**<date>** A string identifying a point in time or the time period between two such points.

<catchwords> → model.msInline → model.textPhraseLike.limited → model.textPhraseLike → <date>

**<decoDesc>** Contains a description of the decoration of an item.

<catchwords> → model.msInline → model.textPhraseLike.limited → <decoDesc>

**<decoNote>** Contains a description of one or more decorative features of an item.

<catchwords> → model.msInline → model.textPhraseLike.limited → <decoNote>

**<dedicatee>** Entity to whom a creative work is formally offered.

<catchwords> → model.msInline → model.textPhraseLike.limited → <dedicatee>

**<dedication>** Contains a dedicatory statement.

<catchwords> → model.msInline → model.textPhraseLike.limited → <dedication>

**<del>** Contains information deleted, marked as deleted, or otherwise indicated as superfluous or spurious in the copy text by an author, scribe, annotator, or corrector.

<catchwords> → model.msInline → model.textPhraseLike.limited → model.editTransPart.text → model.editTransPart → <del>

**<depth>** Description of a measurement taken through a three-dimensional object.

<catchwords> → model.msInline → model.textPhraseLike.limited → <depth>

**<desc>** Container for text that briefly describes the feature to which it is attached, including its intended usage, purpose, or application as appropriate.

<catchwords> → model.msInline → model.textPhraseLike.limited → <desc>

**<dim>** Any single dimensional specification.

<catchwords> → model.msInline → model.textPhraseLike.limited → <dim>

**<dir>** An instruction expressed as a combination of text and symbols, typically above, below, or between staves, but not on the staff — that is not encoded elsewhere in more specific elements, like <tempo>, <dynam> or <repeatMark>.

<catchwords> → model.msInline → model.textPhraseLike.limited → <dir>

**<distributor>** Person or agency, other than a publisher, from which access (including electronic access) to a bibliographic entity may be obtained.

<catchwords> → model.msInline → model.textPhraseLike.limited → <distributor>

**<district>** Contains the name of any kind of subdivision of a settlement, such as a parish, ward, or other administrative or geographic unit.

<catchwords> → model.msinline → model.textPhraseLike.limited → model.textPhraseLike → <district>

**<dynam>** Indication of the volume of a note, phrase, or section of music.

<catchwords> → model.msinline → model.textPhraseLike.limited → <dynam>

**<edition>** A word or text phrase that indicates a difference in either content or form between the item being described and a related item previously issued by the same publisher/distributor (e.g., 2nd edition, version 2.0, etc.), or simultaneously issued by either the same publisher/distributor or another publisher/distributor (e.g., large print edition, British edition, etc.).

<catchwords> → model.msinline → model.textPhraseLike.limited → <edition>

**<editor>** The name of the individual(s), institution(s) or organization(s) acting in an editorial capacity.

<catchwords> → model.msinline → model.textPhraseLike.limited → <editor>

**<epigraph>** Contains a quotation, anonymous or attributed, appearing on a title page.

<catchwords> → model.msinline → model.textPhraseLike.limited → model.textPhraseLike → model.paracontentPart → <epigraph>

**<exhibHist>** A record of public exhibitions, including dates, venues, etc.

<catchwords> → model.msinline → model.textPhraseLike.limited → <exhibHist>

**<expan>** Contains the expansion of an abbreviation.

<catchwords> → model.msinline → model.textPhraseLike.limited → model.editTransPart.text → model.editTransPart → <expan>

**<extent>** Used to express size in terms other than physical dimensions, such as number of pages, records, bytes, physical components, etc.

<catchwords> → model.msinline → model.textPhraseLike.limited → <extent>

**<f>** Single element of a figured bass indication.

<catchwords> → model.msinline → model.textPhraseLike.limited → <f>

**<famName>** Contains a family (inherited) name, as opposed to a given, baptismal, or nick name.

<catchwords> → model.msinline → model.textPhraseLike.limited → model.textPhraseLike → <famName>

**<figDesc>** Contains a brief prose description of the appearance or content of a graphic figure, for use when documenting an image without displaying it.

<catchwords> → model.msinline → model.textPhraseLike.limited → <figDesc>

**<fing>** finger – An individual finger in a fingering indication.

<catchwords> → model.msinline → model.textPhraseLike.limited → <fing>

**<foreName>** Contains a forename, given or baptismal name.

<catchwords> → model.msinline → model.textPhraseLike.limited → model.textPhraseLike → <foreName>

**<funder>** Names of individuals, institutions, or organizations responsible for funding. Funders provide financial support for a project; they are distinct from sponsors, who provide intellectual support and authority.

<catchwords> → model.msinline → model.textPhraseLike.limited → <funder>

**<genName>** Contains a name component used to distinguish otherwise similar names on the basis of the relative ages or generations of the persons named.

<catchwords> → model.msinline → model.textPhraseLike.limited → model.textPhraseLike → <genName>

**<genre>** Term or terms that designate a category characterizing a particular style, form, or content.

<catchwords> → model.msinline → model.textPhraseLike.limited → <genre>

**<geogFeat>** Contains a common noun identifying a geographical feature.

<catchwords> → model.msinline → model.textPhraseLike.limited → model.textPhraseLike → <geogFeat>

**<geogName>** The proper noun designation for a place, natural feature, or political jurisdiction.

<catchwords> → model.msinline → model.textPhraseLike.limited → model.textPhraseLike → <geogName>

**<gliss>** A continuous or sliding movement from one pitch to another, usually indicated by a straight or wavy line.

<catchwords> → model.msinline → model.textPhraseLike.limited → <gliss>

**<hand>** Defines a distinct scribe or handwriting style.

<catchwords> → model.msinline → model.textPhraseLike.limited → <hand>

**<harm>** An indication of harmony, e.g., chord names, tablature grids, harmonic analysis, figured bass.

<catchwords> → model.msinline → model.textPhraseLike.limited → <harm>

**<head>** Contains any heading, for example, the title of a section of text, or the heading of a list.

<catchwords> → model.msinline → model.textPhraseLike.limited → model.textPhraseLike → <head>

**<height>** Description of the vertical size of an object.

<catchwords> → model.msinline → model.textPhraseLike.limited → <height>

**<identifier>** An alpha-numeric string that establishes the identity of the described material.

<catchwords> → model.msinline → model.textPhraseLike.limited → model.textPhraseLike → <identifier>

**<imprimatur>** Contains a formal statement authorizing the publication of a work, sometimes required to appear on a title page or its verso.

<catchwords> → model.msinline → model.textPhraseLike.limited → model.textPhraseLike → model.paracontentPart → <imprimatur>

**<imprint>** Information relating to the publication or distribution of a bibliographic item.

<catchwords> → model.msinline → model.textPhraseLike.limited → model.textPhraseLike → <imprint>

**<I>** Contains a single line of text within a line group.

<catchwords> → model.msinline → model.textPhraseLike.limited → model.textPhraseLike → <I>

**<label>** A container for document text that identifies the feature to which it is attached. For a "tool tip" or other generated label, use the label attribute.

<catchwords> → model.msinline → model.textPhraseLike.limited → <label>

**<labelAbbr>** A label on the pages following the first.

<catchwords> → model.msinline → model.textPhraseLike.limited → <labelAbbr>

**<language>** Description of a language used in the document.

<catchwords> → model.msinline → model.textPhraseLike.limited → <language>

**<layoutDesc>** Collects layout descriptions.

<catchwords> → model.msinline → model.textPhraseLike.limited → <layoutDesc>

**<lem>** (lemma) – Contains the lemma, or base text, of a textual variation.

<catchwords> → model.msinline → model.textPhraseLike.limited → model.rdgPart.text → model.rdgPart → <lem>

**<li>** Single item in a <list>.

<catchwords> → model.msinline → model.textPhraseLike.limited → model.textPhraseLike → <li>

**<librettist>** Person or organization who is a writer of the text of an opera, oratorio, etc.

<catchwords> → model.msinline → model.textPhraseLike.limited → <librettist>

**<line>** A visual line that cannot be represented by a more specific; i.e., semantic, element.

<catchwords> → model.msinline → model.textPhraseLike.limited → <line>

**<lyricist>** Person or organization who is a writer of the text of a song.

<catchwords> → model.msInline → model.textPhraseLike.limited → <lyricist>

**<metaMark>** A graphical or textual statement with additional / explanatory information about the musical text. The textual consequences of this intervention are encoded independently via other means; that is, with elements such as **<add>**, **<del>**, etc.

<catchwords> → model.msInline → model.textPhraseLike.limited → <metaMark>

**<name>** Proper noun or noun phrase.

<catchwords> → model.msInline → model.textPhraseLike.limited → model.textPhraseLike → <name>

**<nameLink>** Contains a connecting phrase or link used within a name but not regarded as part of it, such as "van der" or "of", "from", etc.

<catchwords> → model.msInline → model.textPhraseLike.limited → model.textPhraseLike → <nameLink>

**<num>** Numeric information in any form.

<catchwords> → model.msInline → model.textPhraseLike.limited → model.textPhraseLike → <num>

**<octave>** An indication that a passage should be performed one or more octaves above or below its written pitch.

<catchwords> → model.msInline → model.textPhraseLike.limited → <octave>

**<orig>** Contains material which is marked as following the original, rather than being normalized or corrected.

<catchwords> → model.msInline → model.textPhraseLike.limited → model.editTransPart.text → model.editTransPart → <orig>

**<ornam>** An element indicating an ornament that is not a mordent, turn, or trill.

<catchwords> → model.msInline → model.textPhraseLike.limited → <ornam>

**<p>** One or more text phrases that form a logical prose passage.

<catchwords> → model.msInline → model.textPhraseLike.limited → model.textPhraseLike → model.paracontentPart → <p>

**<perfRes>** Name of an instrument on which a performer plays, a performer's voice range, or a standard performing ensemble designation.

<catchwords> → model.msInline → model.textPhraseLike.limited → <perfRes>

**<periodName>** A label that describes a period of time, such as 'Baroque' or '3rd Style period'.

<catchwords> → model.msInline → model.textPhraseLike.limited → model.textPhraseLike → <periodName>

**<persName>** Designation for an individual, including any or all of that individual's forenames, surnames, honorific titles, and added names.

<catchwords> → model.msInline → model.textPhraseLike.limited → model.textPhraseLike → <persName>

**<pgFoot>** A running footer.

<catchwords> → model.msInline → model.textPhraseLike.limited → <pgFoot>

**<pgHead>** A running header.

<catchwords> → model.msInline → model.textPhraseLike.limited → <pgHead>

**<physDesc>** Container for information about the appearance, construction, or handling of physical materials, such as their dimension, quantity, color, style, and technique of creation.

<catchwords> → model.physDescPart → <physDesc>

**<price>** The cost of access to a bibliographic item.

<catchwords> → model.msInline → model.textPhraseLike.limited → <price>

**<provenance>** The record of ownership or custodianship of an item.

<catchwords> → model.msInline → model.textPhraseLike.limited → <provenance>

**<pubPlace>** Name of the place where a bibliographic item was published.

<catchwords> → model.msInLine → model.textPhraseLike.limited → <pubPlace>

**<publisher>** Name of the organization responsible for the publication of a bibliographic item.

<catchwords> → model.msInLine → model.textPhraseLike.limited → <publisher>

**<q>** Contains material which is distinguished from the surrounding phrase-level text using quotation marks or a similar method. Use <quote> for block-level quotations.

<catchwords> → model.msInLine → model.textPhraseLike.limited → model.textPhraseLike → <q>

**<quote>** Contains a paragraph-like block of text attributed to an external source, normally set off from the surrounding text by spacing or other typographic distinction.

<catchwords> → model.msInLine → model.textPhraseLike.limited → model.textPhraseLike → model.paraContentPart → <quote>

**<rdg>** (reading) – Contains a single reading within a textual variation.

<catchwords> → model.msInLine → model.textPhraseLike.limited → model.rdgPart.text → model.rdgPart → <rdg>

**<recipient>** The name of the individual(s), institution(s) or organization(s) receiving correspondence.

<catchwords> → model.msInLine → model.textPhraseLike.limited → <recipient>

**<ref>** Defines a traversible reference to another location. May contain text and sub-elements that describe the destination.

<catchwords> → model.msInLine → model.textPhraseLike.limited → model.textPhraseLike → <ref>

**<reg>** Contains material which has been regularized or normalized in some sense.

<catchwords> → model.msInLine → model.textPhraseLike.limited → model.editTransPart.text → model.editTransPart → <reg>

**<region>** Contains the name of an administrative unit such as a state, province, or county, larger than a settlement, but smaller than a country.

<catchwords> → model.msInLine → model.textPhraseLike.limited → model.textPhraseLike → <region>

**<rend>** A formatting element indicating special visual rendering, e.g., bold or italicized, of a text word or phrase.

<catchwords> → model.msInLine → model.textPhraseLike.limited → model.textPhraseLike → <rend>

**<repeatMark>** An instruction expressed as a combination of text and symbols – segno and coda – typically above, below, or between staves, but not on the staff.

<catchwords> → model.msInLine → model.textPhraseLike.limited → <repeatMark>

**<repository>** Institution, agency, or individual which holds a bibliographic item.

<catchwords> → model.msInLine → model.textPhraseLike.limited → <repository>

**<resp>** A phrase describing the nature of intellectual responsibility.

<catchwords> → model.msInLine → model.textPhraseLike.limited → <resp>

**<restore>** Indicates restoration of material to an earlier state by cancellation of an editorial or authorial marking or instruction.

<catchwords> → model.msInLine → model.textPhraseLike.limited → model.editTransPart.text → model.editTransPart → <restore>

**<role>** Name of a dramatic role, as given in a cast list.

<catchwords> → model.msInLine → model.textPhraseLike.limited → <role>

**<roleDesc>** Describes a character's role in a drama.

<catchwords> → model.msInLine → model.textPhraseLike.limited → <roleDesc>

**<roleName>** Contains a name component which indicates that the referent has a particular role or position in society, such as an official title or rank.

<catchwords> → model.msInLine → model.textPhraseLike.limited → model.textPhraseLike → <roleName>

**<scriptDesc>** Contains a description of the letters or characters used in an autographic item.

<catchwords> → model.msInline → model.textPhraseLike.limited → <scriptDesc>

**<seal>** A single seal or similar attachment.

<catchwords> → model.msInline → model.textPhraseLike.limited → <seal>

**<sealDesc>** Describes the seals or similar external attachments applied to an item.

<catchwords> → model.msInline → model.textPhraseLike.limited → <sealDesc>

**<seg>** (arbitrary segment) represents any segmentation of text below the "text component" level.

<catchwords> → model.msInline → model.textPhraseLike.limited → model.textPhraseLike → <seg>

**<settlement>** Contains the name of a settlement such as a city, town, or village identified as a single geopolitical or administrative unit.

<catchwords> → model.msInline → model.textPhraseLike.limited → model.textPhraseLike → <settlement>

**<sic>** Contains apparently incorrect or inaccurate material.

<catchwords> → model.msInline → model.textPhraseLike.limited → model.editTransPart.text → model.editTransPart → <sic>

**<signifLet>** Significantive letter(s).

<catchwords> → model.msInline → model.textPhraseLike.limited → <signifLet>

**<soundChan>** Reflects the number of apparent sound channels in the playback of a recording (monaural, stereophonic, quadraphonic, etc.).

<catchwords> → model.msInline → model.textPhraseLike.limited → <soundChan>

**<speaker>** Contains a specialized form of heading or label, giving the name of one or more speakers in a dramatic text or fragment.

<catchwords> → model.msInline → model.textPhraseLike.limited → <speaker>

**<sponsor>** Names of sponsoring individuals, organizations or institutions. Sponsors give their intellectual authority to a project; they are to be distinguished from funders, who provide the funding but do not necessarily take intellectual responsibility.

<catchwords> → model.msInline → model.textPhraseLike.limited → <sponsor>

**<stack>** An inline table with a single column.

<catchwords> → model.msInline → model.textPhraseLike.limited → <stack>

**<stageDir>** Contains any kind of stage direction within a dramatic text or fragment.

<catchwords> → model.msInline → model.textPhraseLike.limited → <stageDir>

**<street>** full street address including any name or number identifying a building as well as the name of the street or route on which it is located.

<catchwords> → model.msInline → model.textPhraseLike.limited → model.textPhraseLike → <street>

**<styleName>** A label for a characteristic style of writing or performance, such as 'bebop' or 'rock-n-roll'.

<catchwords> → model.msInline → model.textPhraseLike.limited → model.textPhraseLike → <styleName>

**<supplied>** Contains material supplied by the transcriber or editor for any reason.

<catchwords> → model.msInline → model.textPhraseLike.limited → model.editTransPart.text → model.editTransPart → <supplied>

**<supportDesc>** Groups elements describing the physical support material of an item.

<catchwords> → model.msInline → model.textPhraseLike.limited → <supportDesc>

**<syl>** Individual lyric syllable.

<catchwords> → model.msInline → model.textPhraseLike.limited → <syl>

**<td>** Designates a table cell that contains data as opposed to a cell that contains column or row heading information.

<catchwords> → model.msinline → model.textPhraseLike.limited → model.textPhraseLike → <td>

**<tempo>** Text and symbols descriptive of tempo, mood, or style, e.g., "allarg.", "a tempo", "cantabile", "Moderato", "J=60", "Moderato J =60").

<catchwords> → model.msinline → model.textPhraseLike.limited → <tempo>

**<term>** Keyword or phrase which describes a resource.

<catchwords> → model.msinline → model.textPhraseLike.limited → <term>

**<textLang>** Identifies the languages and writing systems within the work described by a bibliographic description, not the language of the description.

<catchwords> → model.msinline → model.textPhraseLike.limited → <textLang>

**<th>** Designates a table cell containing column or row heading information as opposed to one containing data.

<catchwords> → model.msinline → model.textPhraseLike.limited → model.textPhraseLike → <th>

**<treatHist>** A record of the treatment the item has undergone (e.g., de-acidification, restoration, etc.).

<catchwords> → model.msinline → model.textPhraseLike.limited → <treatHist>

**<treatSched>** Scheduled treatment, e.g., de-acidification, restoration, etc., for an item.

<catchwords> → model.msinline → model.textPhraseLike.limited → <treatSched>

**<typeDesc>** Contains a description of the typefaces or other aspects of the printing of a printed source.

<catchwords> → model.msinline → model.textPhraseLike.limited → <typeDesc>

**<unclear>** Contains material that cannot be transcribed with certainty because it is illegible or inaudible in the source.

<catchwords> → model.msinline → model.textPhraseLike.limited → model.editTransPart.text → model.editTransPart → <unclear>

**<width>** Description of the horizontal size of an object.

<catchwords> → model.msinline → model.textPhraseLike.limited → <width>

## May Contain

**<abbr>** A generic element for 1) a shortened form of a word, including an acronym or 2) a shorthand notation.

<catchwords> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.editorialLike → <abbr>

**<address>** Contains a postal address, for example of a publisher, an organization, or an individual.

<catchwords> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.addressLike → <address>

**<annot>** Provides a statement explaining the text or indicating the basis for an assertion.

<catchwords> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.annotLike → <annot>

**<bibl>** Provides a loosely-structured bibliographic citation in which the sub-components may or may not be explicitly marked.

<catchwords> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.biblLike → <bibl>

**<biblStruct>** Contains a bibliographic citation in which bibliographic sub-elements must appear in a specified order.

<catchwords> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.biblLike → <biblStruct>

**<bloc>** Contains the name of a geopolitical unit consisting of two or more nation states or countries.

<catchwords> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <bloc>

**<catchwords>** Describes the system used to ensure correct ordering of the quires making up an item, typically by means of annotations at the foot of the page.

<catchwords> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.msInLine → <catchwords>

**<corpName>** Identifies an organization or group of people that acts as a single entity.

<catchwords> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.nameLike → model.nameLike.agent → <corpName>

**<country>** Contains the name of a geopolitical unit, such as a nation, country, colony, or commonwealth, larger than or administratively superior to a region and smaller than a bloc.

<catchwords> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <country>

**<date>** A string identifying a point in time or the time period between two such points.

<catchwords> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.dateLike → <date>

**<dedictee>** Entity to whom a creative work is formally offered.

<catchwords> → macro.struc-unstrucContent → model.textPhraseLike.limited → <dedictee>

**<depth>** Description of a measurement taken through a three-dimensional object.

<catchwords> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.dimLike → <depth>

**<dim>** Any single dimensional specification.

<catchwords> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.dimLike → <dim>

**<dimensions>** Information about the physical size of an entity; usually includes numerical data.

<catchwords> → macro.struc-unstrucContent → model.textPhraseLike.limited → <dimensions>

**<district>** Contains the name of any kind of subdivision of a settlement, such as a parish, ward, or other administrative or geographic unit.

<catchwords> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <district>

**<expan>** Contains the expansion of an abbreviation.

<catchwords> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.editorialLike → <expan>

**<extent>** Used to express size in terms other than physical dimensions, such as number of pages, records, bytes, physical components, etc.

<catchwords> → macro.struc-unstrucContent → model.textPhraseLike.limited → <extent>

**<fig>** Groups elements representing or containing graphic information such as an illustration or figure.

<catchwords> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.figureLike → <fig>

**<geogFeat>** Contains a common noun identifying a geographical feature.

<catchwords> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <geogFeat>

**<geogName>** The proper noun designation for a place, natural feature, or political jurisdiction.

<catchwords> → macro.struc-

unstrucContent → model.textPhraseLike.limited → model.nameLike → model.nameLike.place → model.nameLike.geogName → <geogName>

**<head>** Contains any heading, for example, the title of a section of text, or the heading of a list.

<catchwords> → macro.struc-unstrucContent → model.headLike → <head>

**<height>** Description of the vertical size of an object.

<catchwords> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.dimLike → <height>

**<heraldry>** Contains a heraldic formula or phrase, typically found as part of a blazon, coat of arms, etc.

<catchwords> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.msInLine → <heraldry>

**<identifier>** An alpha-numeric string that establishes the identity of the described material.

<catchwords> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.identifierLike → <identifier>

**<lb>** An empty formatting element that forces text to begin on a new line.

<catchwords> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.lbLike → <lb>

**<locus>** Defines a location within a manuscript or manuscript component, usually as a (possibly discontinuous) sequence of folio references.

<catchwords> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.msInline → <locus>

**<locusGrp>** Groups locations which together form a distinct but discontinuous item within a manuscript or manuscript part, according to a specific foliation.

<catchwords> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.msInline → <locusGrp>

**<name>** Proper noun or noun phrase.

<catchwords> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.nameLike → <name>

**<num>** Numeric information in any form.

<catchwords> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.measurementLike → model.numLike → <num>

**<p>** One or more text phrases that form a logical prose passage.

<catchwords> → macro.struc-unstrucContent → model.pLike → <p>

**<periodName>** A label that describes a period of time, such as 'Baroque' or '3rd Style period'.

<catchwords> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.nameLike.label → <periodName>

**<persName>** Designation for an individual, including any or all of that individual's forenames, surnames, honorific titles, and added names.

<catchwords> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.nameLike → model.nameLike.agent → <persName>

**<postBox>** (postal box or post office box) contains a number or other identifier for some postal delivery point other than a street address.

<catchwords> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.addressPart → <postBox>

**<postCode>** (postal code) contains a numerical or alphanumeric code used as part of a postal address to simplify sorting or delivery of mail.

<catchwords> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.addressPart → <postCode>

**<ptr>** Defines a traversible pointer to another location, using only attributes to describe the destination.

<catchwords> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.locrefLike → <ptr>

**<q>** Contains material which is distinguished from the surrounding phrase-level text using quotation marks or a similar method. Use <quote> for block-level quotations.

<catchwords> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.qLike → <q>

**<ref>** Defines a traversible reference to another location. May contain text and sub-elements that describe the destination.

<catchwords> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.locrefLike → <ref>

**<region>** Contains the name of an administrative unit such as a state, province, or county, larger than a settlement, but smaller than a country.

<catchwords> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <region>

**<relation>** Describes a relationship or linkage amongst entities.

<catchwords> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.relationLike → <relation>

**<relationList>** Gathers relation elements.

<catchwords> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.relationLike → <relationList>

**<rend>** A formatting element indicating special visual rendering, e.g., bold or italicized, of a text word or phrase.

<catchwords> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.rendLike → <rend>

**<repository>** Institution, agency, or individual which holds a bibliographic item.

<catchwords> → macro.struc-

unstrucContent → model.textPhraseLike.limited → model.nameLike → model.nameLike.place → model.repositoryLike → <repository>

**<secFolio>** Marks the word or words taken from a fixed point in a codex (typically the beginning of the second leaf) in order to provide a unique identifier for the item.

<catchwords> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.mslinline → <secFolio>

**<seg>** (arbitrary segment) represents any segmentation of text below the "text component" level.

<catchwords> → macro.struc-unstrucContent → model.textPhraseLike.limited → <seg>

**<settlement>** Contains the name of a settlement such as a city, town, or village identified as a single geopolitical or administrative unit.

<catchwords> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <settlement>

**<signatures>** Provides a description of the leaf or quire signatures found within a codex.

<catchwords> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.mslinline → <signatures>

**<stack>** An inline table with a single column.

<catchwords> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.rendLike → <stack>

**<stamp>** Contains a word or phrase describing an official mark indicating ownership, genuineness, validity, etc.

<catchwords> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.mslinline → <stamp>

**<street>** full street address including any name or number identifying a building as well as the name of the street or route on which it is located.

<catchwords> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.addressPart → <street>

**<styleName>** A label for a characteristic style of writing or performance, such as 'bebop' or 'rock-n-roll'.

<catchwords> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.nameLike.label → <styleName>

**<symbol>** A reference to a previously defined symbol.

<catchwords> → macro.struc-unstrucContent → model.textPhraseLike.limited → <symbol>

**<term>** Keyword or phrase which describes a resource.

<catchwords> → macro.struc-unstrucContent → model.textPhraseLike.limited → <term>

**<title>** Title of a bibliographic entity.

<catchwords> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.titleLike → <title>

**<watermark>** Contains a description of a watermark or similar device.

<catchwords> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.mslinline → <watermark>

**<width>** Description of the horizontal size of an object.

<catchwords> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.dimLike → <width>

## Remarks

The model of this element is based on the **catchwords** element of the Text Encoding Initiative (TEI).

## Constraints

The catchwords element may only appear as a descendant of the physDesc element.

## Declaration

```
<elementSpec ident="catchwords" module="MEI.msDesc">

```

## <category>

Contains an individual descriptive category in a user-defined taxonomy, possibly nested within a superordinate category.

### Referenced in chapters

[3.4.2.5 Class Declarations](#)

### Module

[MEI.header](#)

### Attributes

**@analog** (*optional*) Contains a reference to a field or element in another descriptive encoding system to which this MEI element is comparable. Value is plain text.

<category> → [att.bibl](#) → @analog

**@auth** (*optional*) A name or label associated with a controlled vocabulary or other authoritative source for this element or its content. Value is plain text.

<category> → [att.authorized](#) → @auth

**@auth.uri** (*optional*) A web-accessible location of the controlled vocabulary or other authoritative source of identification or definition for this element or its content. This attribute may contain a complete URI or a partial URI which is completed by the value of the codedval attribute. Value conforms to [data.URI](#).  
<category> → [att.authorized](#) → @auth.uri

**@class** (*optional*) Contains one or more URIs which denote classification terms that apply to the entity bearing this attribute. One or more values from [data.URI](#), separated by spaces.

<category> → [att.common](#) → [att.typed](#) → [att.classed](#) → @class

**@codedval** (*optional*) A value that represents or identifies other data. Often, it is a primary key in the database or a unique value in the coded list identified by the auth or auth.uri attributes. One or more values of datatype **NMTOKEN**, separated by spaces.

<category> → [att.authorized](#) → [att.canonical](#) → @codedval

**@copyof** (*optional*) Points to an element of which the current element is a copy. Value conforms to [data.URI](#).

<category> → [att.common](#) → [att.linkin](#) → @copyof

**@corresp** (*optional*) Used to point to other elements that correspond to this one in a generic fashion. One or more values from [data.URI](#), separated by spaces.

<category> → [att.common](#) → [att.linkin](#) → @corresp

**@data** (*optional*) Used to link metadata elements to one or more data-containing elements. One or more values from [data.URI](#), separated by spaces.

<category> → [att.dataPointing](#) → @data

**@follows** (*optional*) points to one or more events in a user-defined collection that are known to be predecessors of the current element. One or more values from [data.URI](#), separated by spaces.

<category> → [att.common](#) → [att.linkin](#) → @follows

**@label** (*optional*) Captures text to be used to generate a label for the element to which it's attached, a "tool tip" or prefatory text, for example. Should not be used to record document content. Value is plain text.

<category> → att.common → att.labelled → @label

**@n** (*optional*) Provides a number-like designation that indicates an element's position in a sequence of similar elements. May not contain space characters. Value conforms to [data.WORD](#).

<category> → att.common → att.nNumberLike → @n

**@next** (*optional*) Used to point to the next event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<category> → att.common → att.linked → @next

**@precedes** (*optional*) Points to one or more events in a user-defined collection that are known to be successors of the current element. One or more values from [data.URI](#), separated by spaces.

<category> → att.common → att.linked → @precedes

**@prev** (*optional*) Points to the previous event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<category> → att.common → att.linked → @prev

**@resp** (*optional*) Indicates the agent(s) responsible for some aspect of the text's transcription, editing, or encoding. Its value must point to one or more identifiers declared in the document header. One or more values from [data.URI](#), separated by spaces.

<category> → att.common → att.responsibility → @resp

**@sameas** (*optional*) Points to an element that is the same as the current element but is not a literal copy of the current element. One or more values from [data.URI](#), separated by spaces.

<category> → att.common → att.linked → @sameas

**@synch** (*optional*) Points to elements that are synchronous with the current element. One or more values from [data.URI](#), separated by spaces.

<category> → att.common → att.linked → @synch

**@type** (*optional*) Designation which characterizes the element in some sense, using any convenient classification scheme or typology that employs single-token labels. One or more values of datatype **NMTOKEN**, separated by spaces.

<category> → att.common → att.typed → @type

**@xml:base** (*optional*) Provides a base URI reference with which applications can resolve relative URI references into absolute URI references. Value conforms to [data.URI](#).

<category> → att.common → att.basic → @xml:base

**@xml:id** (*optional*) Regularizes the naming of an element and thus facilitates building links between it and other resources. Each id attribute within a document must have a unique value. Value is a valid [xml:id](#).

<category> → att.common → att.basic → att.id → @xml:id

## Member of

(category isn't member of any model class)

## Contained By

**<category>** Contains an individual descriptive category in a user-defined taxonomy, possibly nested within a superordinate category.

<category> → elements having category as direct children → <category>

**<taxonomy>** Defines a typology either implicitly, by means of a bibliographic citation, or explicitly by a structured taxonomy.

<category> → elements having category as direct children → <taxonomy>

## May Contain

**<altId>** May contain a bibliographic identifier that does not fit within the meiHead element's id attribute, for example because the identifier does not fit the definition of an XML id or because multiple identifiers are needed.

<category> → direct children → <altId>

**<catRel>** Contains the name of a related category.

<category> → direct children → <catRel>

**<category>** Contains an individual descriptive category in a user-defined taxonomy, possibly nested within a superordinate category.

<category> → direct children → <category>

**<desc>** Container for text that briefly describes the feature to which it is attached, including its intended usage, purpose, or application as appropriate.

<category> → direct children → <desc>

**<label>** A container for document text that identifies the feature to which it is attached. For a "tool tip" or other generated label, use the label attribute.

<category> → direct children → <label>

## Constraints

To be addressable, the category element must have an xml:id attribute.

## Declaration

```
<elementSpec ident="category" module="MEI.header">
  <desc xml:lang="en">Contains an individual descriptive category in a user-defined taxonomy, possibly nested within a superordinate category.</desc>

</rng:zeroOrMore>
<rng:zeroOrMore>
  <rng:ref name="catRel"/>
</rng:zeroOrMore>
<rng:zeroOrMore>
  <rng:ref name="category"/>
</rng:zeroOrMore>
</content>
<constraintSpec ident="category_id" scheme="schematron">
  <constraint>
    <sch:rule context="mei:category">
      <sch:assert test="@xml:id" role="warning">To be addressable, the category element
        must have an xml:id attribute.</sch:assert>
    </sch:rule>
  </constraint>
</constraintSpec>
</elementSpec>
```

## <cb>

(column beginning) – An empty formatting element that forces text to begin in a new column.

### Referenced in chapters

[2.1.3 Document Layout Elements](#)

### Module

[MEI.shared](#)

### Attributes

**@class** (*optional*) Contains one or more URIs which denote classification terms that apply to the entity bearing this attribute. One or more values from [data.URI](#), separated by spaces.

<cb> → att.typed → att.classed → @class

**@copyof** (*optional*) Points to an element of which the current element is a copy. Value conforms to [data.URI](#).

<cb> → att.linked → @copyof

**@corresp** (*optional*) Used to point to other elements that correspond to this one in a generic fashion. One or more values from [data.URI](#), separated by spaces.

<cb> → att.linked → @corresp

**@facs** (*optional*) Points to one or more images, portions of an image, or surfaces which correspond to the current element. One or more values from [data.URI](#), separated by spaces.

<cb> → att.facsimile → @facs

**@follows** (*optional*) points to one or more events in a user-defined collection that are known to be predecessors of the current element. One or more values from [data.URI](#), separated by spaces.

<cb> → att.linked → @follows

**@label** (*optional*) Captures text to be used to generate a label for the element to which it's attached, a "tool tip" or prefatory text, for example. Should not be used to record document content. Value is plain text.

<cb> → att.labelled → @label

**@n** (*required*) Records the column number. Value is a positive integer.

<cb> → direct children → @n

**@next** (*optional*) Used to point to the next event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<cb> → att.linked → @next

**@precedes** (*optional*) Points to one or more events in a user-defined collection that are known to be successors of the current element. One or more values from [data.URI](#), separated by spaces.

<cb> → att.linked → @precedes

**@prev** (*optional*) Points to the previous event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<cb> → att.linked → @prev

**@resp** (*optional*) Indicates the agent(s) responsible for some aspect of the text's transcription, editing, or encoding. Its value must point to one or more identifiers declared in the document header. One or more values from [data.URI](#), separated by spaces.

<cb> → [att.responsibility](#) → @resp

**@sameas** (*optional*) Points to an element that is the same as the current element but is not a literal copy of the current element. One or more values from [data.URI](#), separated by spaces.

<cb> → [att.linkin](#) → @sameas

**@source** (*optional*) Contains a list of one or more pointers indicating the sources which attest to a given reading. Each value should correspond to the ID of a [<source>](#) or [<manifestation>](#) element located in the document header. One or more values from [data.URI](#), separated by spaces.

<cb> → [att.source](#) → @source

**@synch** (*optional*) Points to elements that are synchronous with the current element. One or more values from [data.URI](#), separated by spaces.

<cb> → [att.linkin](#) → @synch

**@type** (*optional*) Designation which characterizes the element in some sense, using any convenient classification scheme or typology that employs single-token labels. One or more values of datatype **NMTOKEN**, separated by spaces.

<cb> → [att.typed](#) → @type

**@xml:base** (*optional*) Provides a base URI reference with which applications can resolve relative URI references into absolute URI references. Value conforms to [data.URI](#).

<cb> → [att.basic](#) → @xml:base

**@xml:id** (*optional*) Regularizes the naming of an element and thus facilitates building links between it and other resources. Each id attribute within a document must have a unique value. Value is a valid [xml:id](#).

<cb> → [att.basic](#) → [att.id](#) → @xml:id

## Member of

[model.milestoneLike.music](#) Groups milestone-style elements found in music notation.

[model.milestoneLike.text](#) Groups milestone-style elements found in text.

## Contained By

**<abbr>** A generic element for 1) a shortened form of a word, including an acronym or 2) a shorthand notation.

<cb> → [model.milestoneLike.music](#) → <abbr>

**<add>** Marks an addition to the text.

<cb> → [model.milestoneLike.music](#) → <add>

**<argument>** Contains a formal list or prose description of topics addressed.

<cb> → [model.milestoneLike.text](#) → <argument>

**<back>** Contains any appendixes, advertisements, indexes, etc. following the main body of a musical text.

<cb> → [model.milestoneLike.text](#) → <back>

**<corr>** Contains the correct form of an apparent erroneous passage.

<cb> → [model.milestoneLike.music](#) → <corr>

**<damage>** Contains an area of damage to the physical medium.

<cb> → model.milestoneLike.music → <damage>

**<del>** Contains information deleted, marked as deleted, or otherwise indicated as superfluous or spurious in the copy text by an author, scribe, annotator, or corrector.

<cb> → model.milestoneLike.music → <del>

**<div>** Major structural division of text, such as a preface, chapter or section.

<cb> → model.milestoneLike.text → <div>

**<ending>** Alternative ending for a repeated passage of music; i.e., prima volta, seconda volta, etc.

<cb> → model.milestoneLike.music → <ending>

**<expan>** Contains the expansion of an abbreviation.

<cb> → model.milestoneLike.music → <expan>

**<front>** Bundles prefatory text found before the start of the musical text.

<cb> → model.milestoneLike.text → <front>

**<layer>** An independent stream of events on a staff.

<cb> → model.milestoneLike.music → <layer>

**<lem>** (lemma) – Contains the lemma, or base text, of a textual variation.

<cb> → model.milestoneLike.music → <lem>

**<measure>** Unit of musical time consisting of a fixed number of note values of a given type, as determined by the prevailing meter, and delimited in musical notation by bar lines.

<cb> → model.milestoneLike.music → <measure>

**<oLayer>** A layer that contains an alternative to material in another layer.

<cb> → model.milestoneLike.music → <oLayer>

**<oStaff>** A staff that holds an alternative passage which may be played instead of the original material.

<cb> → model.milestoneLike.music → <oStaff>

**<orig>** Contains material which is marked as following the original, rather than being normalized or corrected.

<cb> → model.milestoneLike.music → <orig>

**<part>** An alternative visual rendition of the score from the point of view of a particular performer (or group of performers).

<cb> → model.milestoneLike.music → <part>

**<rdg>** (reading) – Contains a single reading within a textual variation.

<cb> → model.milestoneLike.music → <rdg>

**<reg>** Contains material which has been regularized or normalized in some sense.

<cb> → model.milestoneLike.music → <reg>

**<restore>** Indicates restoration of material to an earlier state by cancellation of an editorial or authorial marking or instruction.

<cb> → model.milestoneLike.music → <restore>

**<score>** Full score view of the musical content.

<cb> → model.milestoneLike.music → <score>

**<section>** Segment of music data.

<cb> → model.milestoneLike.music → <section>

**<series>** Contains information about the serial publication in which a bibliographic item has appeared.

<cb> → model.milestoneLike.text → <series>

**<sic>** Contains apparently incorrect or inaccurate material.

<cb> → model.milestoneLike.music → <sic>

**<sp>** Contains an individual speech in a performance text.

<cb> → model.milestoneLike.text → <sp>

**<staff>** A group of equidistant horizontal lines on which notes are placed in order to represent pitch or a grouping element for individual 'strands' of notes, rests, etc. that may or may not actually be rendered on staff lines; that is, both diastematic and non-diastematic signs.

<cb> → model.milestoneLike.music → <staff>

**<supplied>** Contains material supplied by the transcriber or editor for any reason.

<cb> → model.milestoneLike.music → <supplied>

**<syllable>** Neume notation can be thought of as "neumed text". Therefore, the syllable element provides high-level organization in this repertoire.

<cb> → model.milestoneLike.music → <syllable>

**<titlePage>** Contains a transcription of the title page of a text.

<cb> → model.milestoneLike.text → <titlePage>

**<unclear>** Contains material that cannot be transcribed with certainty because it is illegible or inaudible in the source.

<cb> → model.milestoneLike.music → <unclear>

## May Contain

– (<cb> may not have child elements)

## Remarks

The model of this element is based on the **cb** element of the Text Encoding Initiative (TEI).

## Constraints

Column beginning must be preceded by a colLayout element.

The value of @n should be less than or equal to the value of @cols ( ) of the preceding colLayout element.

## Declaration

```
<elementSpec ident="cb" module="MEI.shared">
  <gloss versionDate="2022-05-18" xml:lang="en">column beginning</gloss>

## <cc>

(control change) – MIDI parameter/control change.

### Referenced in chapters

[14.5.3 Recording MIDI Event Data](#)

### Module

[MEI.midi](#)

### Attributes

**@class** (*optional*) Contains one or more URIs which denote classification terms that apply to the entity bearing this attribute. One or more values from [data.URI](#), separated by spaces.

<cc> → att.common → att.typed → att.classed → @class

**@copyof** (*optional*) Points to an element of which the current element is a copy. Value conforms to [data.URI](#).

<cc> → att.common → att.linked → @copyof

**@corresp** (*optional*) Used to point to other elements that correspond to this one in a generic fashion. One or more values from [data.URI](#), separated by spaces.

<cc> → att.common → att.linked → @corresp

**@follows** (*optional*) points to one or more events in a user-defined collection that are known to be predecessors of the current element. One or more values from [data.URI](#), separated by spaces.

<cc> → att.common → att.linked → @follows

**@label** (*optional*) Captures text to be used to generate a label for the element to which it's attached, a "tool tip" or prefatory text, for example. Should not be used to record document content. Value is plain text.

<cc> → att.common → att.labelled → @label

**@layer** (*optional*) Identifies the layer to which a feature applies. One or more values of datatype **positiveInteger**, separated by spaces.

<cc> → att.midi.event → att.layerIdent → @layer

**@n** (*optional*) Provides a number-like designation that indicates an element's position in a sequence of similar elements. May not contain space characters. Value conforms to [data.WORD](#).

<cc> → att.common → att.nNumberLike → @n

**@next** (*optional*) Used to point to the next event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<cc> → att.common → att.linked → @next

**@num** (*required*) MIDI number in the range set by [data.MIDIVALE](#). Value conforms to [data.MIDIVALE](#).

<cc> → att.midiNumber → @num

**@part** (*optional*) Indicates the part in which the current feature should appear. Use '%all' when the feature should occur in every part. One or more values of datatype **a string matching the following regular expression: "(%all|#[\w][\w]+)"**, separated by spaces.

<cc> → att.midi.event → att.partIdent → @part

**@partstaff** (*optional*) Signifies the part staff on which a notated feature occurs. Use '%all' when the feature should occur on every staff. One or more values of datatype **a string matching the following regular expression: "(%all|\d+(-\d+)?)"**, separated by spaces.

<cc> → att.midi.event → att.partIdent → @partstaff

**@precedes** (*optional*) Points to one or more events in a user-defined collection that are known to be successors of the current element. One or more values from [data.URI](#), separated by spaces.

<cc> → att.common → att.linked → @precedes

**@prev** (*optional*) Points to the previous event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<cc> → att.common → att.linked → @prev

**@resp** (*optional*) Indicates the agent(s) responsible for some aspect of the text's transcription, editing, or encoding. Its value must point to one or more identifiers declared in the document header. One or more values from [data.URI](#), separated by spaces.

<cc> → att.common → att.responsibility → @resp

**@sameas** (*optional*) Points to an element that is the same as the current element but is not a literal copy of the current element. One or more values from [data.URI](#), separated by spaces.

<cc> → att.common → att.linked → @sameas

**@staff** (*recommended*) Signifies the staff on which a notated event occurs or to which a control event applies. Mandatory when applicable. One or more values of datatype **positiveInteger**, separated by spaces.

<cc> → att.midi.event → att.staffIdent → @staff

**@synch** (*optional*) Points to elements that are synchronous with the current element. One or more values from [data.URI](#), separated by spaces.

<cc> → att.common → att.linked → @synch

**@tstamp** (*optional*) Encodes the onset time in terms of musical time, i.e., beats[.fractional beat part], as expressed in the written time signature. Value conforms to [data.BEAT](#).

<cc> → att.midi.event → att.timestamp.log → @tstamp

**@tstamp.ges** (*optional*) Encodes the onset time in terms of musical time, i.e., beats[.fractional beat part], as expressed in the written time signature. Value conforms to [data.BEAT](#).

<cc> → att.midi.event → att.timestamp.ges → @tstamp.ges

**@tstamp.real** (*optional*) Records the onset time in terms of ISO time. Value conforms to [data.ISOTIME](#).

<cc> → att.midi.event → att.timestamp.ges → @tstamp.real

**@type** (*optional*) Designation which characterizes the element in some sense, using any convenient classification scheme or typology that employs single-token labels. One or more values of datatype **NMTOKEN**, separated by spaces.

<cc> → att.common → att.typed → @type

**@val** (*optional*) MIDI number. Value conforms to [data.MIDIVALUE](#).

<cc> → att.midiValue → @val

**@xml:base** (*optional*) Provides a base URI reference with which applications can resolve relative URI references into absolute URI references. Value conforms to [data.URI](#).

<cc> → att.common → att.basic → @xml:base

**@xml:id** (*optional*) Regularizes the naming of an element and thus facilitates building links between it and other resources. Each id attribute within a document must have a unique value. Value is a valid `xml:id`.

<cc> → att.common → att.basic → att.id → @xml:id

### Member of

(cc isn't member of any model class)

### Contained By

**<midi>** Container for elements that contain information useful when generating MIDI output.  
 <cc> → elements having cc as direct children → <midi>

### May Contain

– (<cc> *may not have child elements*)

### Remarks

The num attribute specifies a MIDI parameter number, while val contains the parameter value. Each must fall in the range 0-127.

### Declaration

```

<elementSpec ident="cc" module="MEI.midi">
  <gloss versionDate="2022-05-18" xml:lang="en">control change</gloss>
  <desc xml:lang="en">MIDI parameter/control change.</desc>
  <classes>
    <memberOf key="att.common"/>
    <memberOf key="att.midi.event"/>
    <memberOf key="att.midiNumber"/>
    <memberOf key="att.midiValue"/>
  </classes>
  <content>
    <rng:empty/>
  </content>
  <remarks xml:lang="en">
    <p>The <att>num</att> attribute specifies a MIDI parameter number, while <att>val</att> contains the parameter value. Each must fall in the range 0-127.</p>
  </remarks>
</elementSpec>

```

## <chan>

(channel) – MIDI channel assignment.

### Module

MEI.midi

### Attributes

**@class** (*optional*) Contains one or more URIs which denote classification terms that apply to the entity bearing this attribute. One or more values from [data.URI](#), separated by spaces.

<chan> → att.common → att.typed → att.classed → @class

**@copyof** (*optional*) Points to an element of which the current element is a copy. Value conforms to [data.URI](#).

<chan> → att.common → att.linked → @copyof

**@corresp** (*optional*) Used to point to other elements that correspond to this one in a generic fashion. One or more values from [data.URI](#), separated by spaces.

<chan> → att.common → att.linked → @corresp

**@follows** (*optional*) points to one or more events in a user-defined collection that are known to be predecessors of the current element. One or more values from [data.URI](#), separated by spaces.

<chan> → att.common → att.linked → @follows

**@label** (*optional*) Captures text to be used to generate a label for the element to which it's attached, a "tool tip" or prefatory text, for example. Should not be used to record document content. Value is plain text.

<chan> → att.common → att.labelled → @label

**@layer** (*optional*) Identifies the layer to which a feature applies. One or more values of datatype **positiveInteger**, separated by spaces.

<chan> → att.midi.event → att.layerIdent → @layer

**@n** (*optional*) Provides a number-like designation that indicates an element's position in a sequence of similar elements. May not contain space characters. Value conforms to [data.WORD](#).

<chan> → att.common → att.nNumberLike → @n

**@next** (*optional*) Used to point to the next event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<chan> → att.common → att.linked → @next

**@num** (*required*) MIDI number in the range set by [data.MIDICHANNEL](#). Value conforms to [data.MIDICHANNEL](#).

<chan> → direct children → @num

**@part** (*optional*) Indicates the part in which the current feature should appear. Use '%all' when the feature should occur in every part. One or more values of datatype **a string matching the following regular expression: "(%all|#[\n][\c]+)"**, separated by spaces.

<chan> → att.midi.event → att.partIdent → @part

**@partstaff** (*optional*) Signifies the part staff on which a notated feature occurs. Use '%all' when the feature should occur on every staff. One or more values of datatype **a string matching the following regular expression: "(%all|\d+(-\d+)?)"**, separated by spaces.

<chan> → att.midi.event → att.partIdent → @partstaff

**@precedes** (*optional*) Points to one or more events in a user-defined collection that are known to be successors of the current element. One or more values from [data.URI](#), separated by spaces.

<chan> → att.common → att.linkin → @precedes

**@prev** (*optional*) Points to the previous event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<chan> → att.common → att.linkin → @prev

**@resp** (*optional*) Indicates the agent(s) responsible for some aspect of the text's transcription, editing, or encoding. Its value must point to one or more identifiers declared in the document header. One or more values from [data.URI](#), separated by spaces.

<chan> → att.common → att.responsibility → @resp

**@sameas** (*optional*) Points to an element that is the same as the current element but is not a literal copy of the current element. One or more values from [data.URI](#), separated by spaces.

<chan> → att.common → att.linkin → @sameas

**@staff** (*recommended*) Signifies the staff on which a notated event occurs or to which a control event applies. Mandatory when applicable. One or more values of datatype **positiveInteger**, separated by spaces.

<chan> → att.midi.event → att.staffIdent → @staff

**@synch** (*optional*) Points to elements that are synchronous with the current element. One or more values from [data.URI](#), separated by spaces.

<chan> → att.common → att.linkin → @synch

**@tstamp** (*optional*) Encodes the onset time in terms of musical time, i.e., beats[.fractional beat part], as expressed in the written time signature. Value conforms to [data.BEAT](#).

<chan> → att.midi.event → att.timestamp.log → @tstamp

**@tstamp.ges** (*optional*) Encodes the onset time in terms of musical time, i.e., beats[.fractional beat part], as expressed in the written time signature. Value conforms to [data.BEAT](#).

<chan> → att.midi.event → att.timestamp.ges → @tstamp.ges

**@tstamp.real** (*optional*) Records the onset time in terms of ISO time. Value conforms to [data.ISOTIME](#).

<chan> → att.midi.event → att.timestamp.ges → @tstamp.real

**@type** (*optional*) Designation which characterizes the element in some sense, using any convenient classification scheme or typology that employs single-token labels. One or more values of datatype **NMTOKEN**, separated by spaces.

<chan> → att.common → att.typed → @type

**@xml:base** (*optional*) Provides a base URI reference with which applications can resolve relative URI references into absolute URI references. Value conforms to [data.URI](#).

<chan> → att.common → att.basic → @xml:base

**@xml:id** (*optional*) Regularizes the naming of an element and thus facilitates building links between it and other resources. Each id attribute within a document must have a unique value. Value is a valid [xml:id](#).

<chan> → att.common → att.basic → att.id → @xml:id

## Member of

(chan isn't member of any model class)

**Contained By**

**<midi>** Container for elements that contain information useful when generating MIDI output.  
<chan> → elements having chan as direct children → <midi>

**May Contain**

- (<chan> may not have child elements)

**Declaration**

```

## <chanPr>

(channel pressure) – MIDI channel pressure/after touch.

### Module

[MEI.midi](#)

### Attributes

**@class** (*optional*) Contains one or more URIs which denote classification terms that apply to the entity bearing this attribute. One or more values from [data.URI](#), separated by spaces.

<chanPr> → [att.common](#) → [att.typed](#) → [att.classed](#) → @class

**@copyof** (*optional*) Points to an element of which the current element is a copy. Value conforms to [data.URI](#).

<chanPr> → [att.common](#) → [att.linkin](#) → @copyof

**@corresp** (*optional*) Used to point to other elements that correspond to this one in a generic fashion. One or more values from [data.URI](#), separated by spaces.

<chanPr> → [att.common](#) → [att.linkin](#) → @corresp

**@follows** (*optional*) points to one or more events in a user-defined collection that are known to be predecessors of the current element. One or more values from [data.URI](#), separated by spaces.

<chanPr> → [att.common](#) → [att.linkin](#) → @follows

**@label** (*optional*) Captures text to be used to generate a label for the element to which it's attached, a "tool tip" or prefatory text, for example. Should not be used to record document content. Value is plain text.

<chanPr> → [att.common](#) → [att.labellin](#) → @label

**@layer** (*optional*) Identifies the layer to which a feature applies. One or more values of datatype **positiveInteger**, separated by spaces.

<chanPr> → [att.midi.event](#) → [att.layerIdent](#) → @layer

**@n** (*optional*) Provides a number-like designation that indicates an element's position in a sequence of similar elements. May not contain space characters. Value conforms to [data.WORD](#).

<chanPr> → [att.common](#) → [att.nNumberLike](#) → @n

**@next** (*optional*) Used to point to the next event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<chanPr> → [att.common](#) → [att.linkin](#) → @next

**@num** (*required*) MIDI number in the range set by [data.MIDIVALUE](#). Value conforms to [data.MIDIVALUE](#).

<chanPr> → [att.midiNumber](#) → @num

**@part** (*optional*) Indicates the part in which the current feature should appear. Use '%all' when the feature should occur in every part. One or more values of datatype **a string matching the following regular expression: "(%all|#[\i][\c]+)"**, separated by spaces.

<chanPr> → [att.midi.event](#) → [att.partIdent](#) → @part

**@partstaff** (*optional*) Signifies the part staff on which a notated feature occurs. Use '%all' when the feature should occur on every staff. One or more values of datatype **a string matching the following regular expression: "(%all|\d+(-\d+)?)"**, separated by spaces.

<chanPr> → [att.midi.event](#) → [att.partIdent](#) → @partstaff

**@precedes** (*optional*) Points to one or more events in a user-defined collection that are known to be successors of the current element. One or more values from [data.URI](#), separated by spaces.

<chanPr> → [att.common](#) → [att.linking](#) → @precedes

**@prev** (*optional*) Points to the previous event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<chanPr> → [att.common](#) → [att.linking](#) → @prev

**@resp** (*optional*) Indicates the agent(s) responsible for some aspect of the text's transcription, editing, or encoding. Its value must point to one or more identifiers declared in the document header. One or more values from [data.URI](#), separated by spaces.

<chanPr> → [att.common](#) → [att.responsibility](#) → @resp

**@sameas** (*optional*) Points to an element that is the same as the current element but is not a literal copy of the current element. One or more values from [data.URI](#), separated by spaces.

<chanPr> → [att.common](#) → [att.linking](#) → @sameas

**@staff** (*recommended*) Signifies the staff on which a notated event occurs or to which a control event applies. Mandatory when applicable. One or more values of datatype **positiveInteger**, separated by spaces.

<chanPr> → [att.midi.event](#) → [att.staffId](#) → @staff

**@synch** (*optional*) Points to elements that are synchronous with the current element. One or more values from [data.URI](#), separated by spaces.

<chanPr> → [att.common](#) → [att.linking](#) → @synch

**@tstamp** (*optional*) Encodes the onset time in terms of musical time, i.e., beats[.fractional beat part], as expressed in the written time signature. Value conforms to [data.BEAT](#).

<chanPr> → [att.midi.event](#) → [att.timestamp.log](#) → @tstamp

**@tstamp.ges** (*optional*) Encodes the onset time in terms of musical time, i.e., beats[.fractional beat part], as expressed in the written time signature. Value conforms to [data.BEAT](#).

<chanPr> → [att.midi.event](#) → [att.timestamp.ges](#) → @tstamp.ges

**@tstamp.real** (*optional*) Records the onset time in terms of ISO time. Value conforms to [data.ISOTIME](#).

<chanPr> → [att.midi.event](#) → [att.timestamp.ges](#) → @tstamp.real

**@type** (*optional*) Designation which characterizes the element in some sense, using any convenient classification scheme or typology that employs single-token labels. One or more values of datatype **NMTOKEN**, separated by spaces.

<chanPr> → [att.common](#) → [att.typed](#) → @type

**@xml:base** (*optional*) Provides a base URI reference with which applications can resolve relative URI references into absolute URI references. Value conforms to [data.URI](#).

<chanPr> → [att.common](#) → [att.basic](#) → @xml:base

**@xml:id** (*optional*) Regularizes the naming of an element and thus facilitates building links between it and other resources. Each id attribute within a document must have a unique value. Value is a valid [xml:id](#).

<chanPr> → [att.common](#) → [att.basic](#) → [att.id](#) → @xml:id

## Member of

(chanPr isn't member of any model class)

**Contained By**

<midi> Container for elements that contain information useful when generating MIDI output.  
<chanPr> → elements having chanPr as direct children → <midi>

**May Contain**

– (<chanPr> may not have child elements)

**Remarks**

The value of the num attribute must be in the range 0-127.

**Declaration**

```
<elementSpec ident="chanPr" module="MEI.midi">
  <gloss versionDate="2022-05-18" xml:lang="en">channel pressure</gloss>
  <desc xml:lang="en">MIDI channel pressure/after touch.</desc>

  </remarks>
</elementSpec>
```

## <change>

Individual change within the revision description.

### Referenced in chapters

[3.3.2 Responsibility Attribution](#), [3.4.3 Revision Description](#)

### Module

[MEI.header](#)

### Attributes

**@analog** (*optional*) Contains a reference to a field or element in another descriptive encoding system to which this MEI element is comparable. Value is plain text.

<change> → [att.bibl](#) → @analog

**@class** (*optional*) Contains one or more URIs which denote classification terms that apply to the entity bearing this attribute. One or more values from [data.URI](#), separated by spaces.

<change> → [att.common](#) → [att.typed](#) → [att.classed](#) → @class

**@copyof** (*optional*) Points to an element of which the current element is a copy. Value conforms to [data.URI](#).

<change> → [att.common](#) → [att.linkin](#) → @copyof

**@corresp** (*optional*) Used to point to other elements that correspond to this one in a generic fashion. One or more values from [data.URI](#), separated by spaces.

<change> → [att.common](#) → [att.linkin](#) → @corresp

**@enddate** (*optional*) Contains the end point of a date range in standard ISO form. Value conforms to [data.ISODATE](#).

<change> → [att.datable](#) → @enddate

**@follows** (*optional*) points to one or more events in a user-defined collection that are known to be predecessors of the current element. One or more values from [data.URI](#), separated by spaces.

<change> → [att.common](#) → [att.linkin](#) → @follows

**@isodate** (*optional*) Provides the value of a textual date in standard ISO form. Value conforms to [data.ISODATE](#).

<change> → [att.datable](#) → @isodate

**@label** (*optional*) Captures text to be used to generate a label for the element to which it's attached, a "tool tip" or prefatory text, for example. Should not be used to record document content. Value is plain text.

<change> → [att.common](#) → [att.labelled](#) → @label

**@n** (*optional*) Provides a number-like designation that indicates an element's position in a sequence of similar elements. May not contain space characters. Value conforms to [data.WORD](#).

<change> → [att.common](#) → [att.nNumberLike](#) → @n

**@next** (*optional*) Used to point to the next event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<change> → [att.common](#) → [att.linkin](#) → @next

**@notafter** (*optional*) Contains an upper boundary for an uncertain date in standard ISO form. Value conforms to [data.ISODATE](#).

<change> → [att.datable](#) → @notafter

**@notbefore** (*optional*) Contains a lower boundary, in standard ISO form, for an uncertain date. Value conforms to [data.ISODATE](#).

<change> → [att.datable](#) → @notbefore

**@precedes** (*optional*) Points to one or more events in a user-defined collection that are known to be successors of the current element. One or more values from [data.URI](#), separated by spaces.

<change> → [att.common](#) → [att.linking](#) → @precedes

**@prev** (*optional*) Points to the previous event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<change> → [att.common](#) → [att.linking](#) → @prev

**@resp** (*optional*) Indicates the agent(s) responsible for some aspect of the text's transcription, editing, or encoding. Its value must point to one or more identifiers declared in the document header. One or more values from [data.URI](#), separated by spaces.

<change> → [att.common](#) → [att.responsibility](#) → @resp

**@sameas** (*optional*) Points to an element that is the same as the current element but is not a literal copy of the current element. One or more values from [data.URI](#), separated by spaces.

<change> → [att.common](#) → [att.linking](#) → @sameas

**@startdate** (*optional*) Contains the starting point of a date range in standard ISO form. Value conforms to [data.ISODATE](#).

<change> → [att.datable](#) → @startdate

**@synch** (*optional*) Points to elements that are synchronous with the current element. One or more values from [data.URI](#), separated by spaces.

<change> → [att.common](#) → [att.linking](#) → @synch

**@type** (*optional*) Designation which characterizes the element in some sense, using any convenient classification scheme or typology that employs single-token labels. One or more values of datatype

**NMTOKEN**, separated by spaces.

<change> → [att.common](#) → [att.typed](#) → @type

**@xml:base** (*optional*) Provides a base URI reference with which applications can resolve relative URI references into absolute URI references. Value conforms to [data.URI](#).

<change> → [att.common](#) → [att.basic](#) → @xml:base

**@xml:id** (*optional*) Regularizes the naming of an element and thus facilitates building links between it and other resources. Each id attribute within a document must have a unique value. Value is a valid [xml:id](#).

<change> → [att.common](#) → [att.basic](#) → [att.id](#) → @xml:id

## Member of

(change isn't member of any model class)

## Contained By

**<revisionDesc>** Container for information about alterations that have been made to an MEI file.

<change> → elements having change as direct children → <revisionDesc>

## May Contain

**<changeDesc>** Description of a revision of the MEI file.

<change> → direct children → <changeDesc>

**<date>** A string identifying a point in time or the time period between two such points.

<change> → model.dateLike → <date>

**<respStmt>** Transcription of text that names one or more individuals, groups, or in rare cases, mechanical processes, responsible for creation, realization, production, funding, or distribution of the intellectual or artistic content.

<change> → direct children → <respStmt>

## Remarks

Additions, deletions, and significant recoding should be noted, but not correction of minor typographical errors. It is recommended that revisions should be entered in reverse chronological order, with the most recent **<change>** first. The resp attribute contains a pointer to an element containing info about the person/entity responsible for change. The **<edition>** element can be used to designate an MEI encoding that has been so substantively changed that it constitutes a new version that supersedes earlier versions.

The model of this element is based on the respective element of the Encoded Archival Description (EAD).

## Constraints

The date of the change must be recorded in an isodate attribute or date element.

It is recommended that the agent responsible for the change be recorded in a resp attribute or in a name, corpName, or persName element in the respStmt element.

## Declaration

```
<elementSpec ident="change" module="MEI.header">

## <changeDesc>

(change description) – Description of a revision of the MEI file.

### Referenced in chapters

[3.4.3 Revision Description](#)

### Module

[MEI.header](#)

### Attributes

**@analog** (*optional*) Contains a reference to a field or element in another descriptive encoding system to which this MEI element is comparable. Value is plain text.

<changeDesc> → [att.bibl](#) → @analog

**@class** (*optional*) Contains one or more URIs which denote classification terms that apply to the entity bearing this attribute. One or more values from [data.URI](#), separated by spaces.

<changeDesc> → [att.common](#) → [att.typed](#) → [att.classed](#) → @class

**@copyof** (*optional*) Points to an element of which the current element is a copy. Value conforms to [data.URI](#).

<changeDesc> → [att.common](#) → [att.linkin](#) → @copyof

**@corresp** (*optional*) Used to point to other elements that correspond to this one in a generic fashion. One or more values from [data.URI](#), separated by spaces.

<changeDesc> → [att.common](#) → [att.linkin](#) → @corresp

**@follows** (*optional*) points to one or more events in a user-defined collection that are known to be predecessors of the current element. One or more values from [data.URI](#), separated by spaces.

<changeDesc> → [att.common](#) → [att.linkin](#) → @follows

**@label** (*optional*) Captures text to be used to generate a label for the element to which it's attached, a "tool tip" or prefatory text, for example. Should not be used to record document content. Value is plain text.

<changeDesc> → [att.common](#) → [att.labelled](#) → @label

**@n** (*optional*) Provides a number-like designation that indicates an element's position in a sequence of similar elements. May not contain space characters. Value conforms to [data.WORD](#).

<changeDesc> → [att.common](#) → [att.nNumberLike](#) → @n

**@next** (*optional*) Used to point to the next event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<changeDesc> → [att.common](#) → [att.linkin](#) → @next

**@precedes** (*optional*) Points to one or more events in a user-defined collection that are known to be successors of the current element. One or more values from [data.URI](#), separated by spaces.

<changeDesc> → [att.common](#) → [att.linkin](#) → @precedes

**@prev** (*optional*) Points to the previous event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<changeDesc> → [att.common](#) → [att.linkin](#) → @prev

**@resp** (*optional*) Indicates the agent(s) responsible for some aspect of the text's transcription, editing, or encoding. Its value must point to one or more identifiers declared in the document header. One or more values from [data.URI](#), separated by spaces.

<changeDesc> → att.common → att.responsibility → @resp

**@sameas** (*optional*) Points to an element that is the same as the current element but is not a literal copy of the current element. One or more values from [data.URI](#), separated by spaces.

<changeDesc> → att.common → att.linked → @sameas

**@synch** (*optional*) Points to elements that are synchronous with the current element. One or more values from [data.URI](#), separated by spaces.

<changeDesc> → att.common → att.linked → @synch

**@translit** (*optional*) Specifies the transliteration technique used. Value is a [NMOKEN](#).

<changeDesc> → att.lang → @translit

**@type** (*optional*) Designation which characterizes the element in some sense, using any convenient classification scheme or typology that employs single-token labels. One or more values of datatype [NMOKEN](#), separated by spaces.

<changeDesc> → att.common → att.typed → @type

**@xml:base** (*optional*) Provides a base URI reference with which applications can resolve relative URI references into absolute URI references. Value conforms to [data.URI](#).

<changeDesc> → att.common → att.basic → @xml:base

**@xml:id** (*optional*) Regularizes the naming of an element and thus facilitates building links between it and other resources. Each id attribute within a document must have a unique value. Value is a valid [xml:id](#).

<changeDesc> → att.common → att.basic → att.id → @xml:id

**@xml:lang** (*optional*) Identifies the language of the element's content. The values for this attribute are language 'tags' as defined in BCP 47. All language tags that make use of private use sub-tags must be documented in a corresponding language element in the MEI header whose id attribute is the same as the language tag's value. Value is a [language](#).

<changeDesc> → att.lang → @xml:lang

## Member of

(changeDesc isn't member of any model class)

## Contained By

**<change>** Individual change within the revision description.

<changeDesc> → elements having changeDesc as direct children → <change>

## May Contain

**<p>** One or more text phrases that form a logical prose passage.

<changeDesc> → model.pLike → <p>

## Declaration

```
<elementSpec ident="changeDesc" module="MEI.header">
  <gloss versionDate="2022-05-18" xml:lang="en">change description</gloss>
```

```
<desc xml:lang="en">Description of a revision of the MEI file.</desc>

### Module

[MEI.edittrans](#)

### Attributes

**@class** (*optional*) Contains one or more URIs which denote classification terms that apply to the entity bearing this attribute. One or more values from [data.URI](#), separated by spaces.

<choice> → att.common → att.typed → att.classed → @class

**@copyof** (*optional*) Points to an element of which the current element is a copy. Value conforms to [data.URI](#).

<choice> → att.common → att.linkin → @copyof

**@corresp** (*optional*) Used to point to other elements that correspond to this one in a generic fashion. One or more values from [data.URI](#), separated by spaces.

<choice> → att.common → att.linkin → @corresp

**@follows** (*optional*) points to one or more events in a user-defined collection that are known to be predecessors of the current element. One or more values from [data.URI](#), separated by spaces.

<choice> → att.common → att.linkin → @follows

**@label** (*optional*) Captures text to be used to generate a label for the element to which it's attached, a "tool tip" or prefatory text, for example. Should not be used to record document content. Value is plain text.

<choice> → att.common → att.labelled → @label

**@n** (*optional*) Provides a number-like designation that indicates an element's position in a sequence of similar elements. May not contain space characters. Value conforms to [data.WORD](#).

<choice> → att.common → att.nNumberLike → @n

**@next** (*optional*) Used to point to the next event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<choice> → att.common → att.linkin → @next

**@precedes** (*optional*) Points to one or more events in a user-defined collection that are known to be successors of the current element. One or more values from [data.URI](#), separated by spaces.

<choice> → att.common → att.linkin → @precedes

**@prev** (*optional*) Points to the previous event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<choice> → att.common → att.linkin → @prev

**@resp** (*optional*) Indicates the agent(s) responsible for some aspect of the text's transcription, editing, or encoding. Its value must point to one or more identifiers declared in the document header. One or more values from [data.URI](#), separated by spaces.

<choice> → [att.common](#) → [att.responsibility](#) → @resp

**@sameas** (*optional*) Points to an element that is the same as the current element but is not a literal copy of the current element. One or more values from [data.URI](#), separated by spaces.

<choice> → [att.common](#) → [att.linking](#) → @sameas

**@synch** (*optional*) Points to elements that are synchronous with the current element. One or more values from [data.URI](#), separated by spaces.

<choice> → [att.common](#) → [att.linking](#) → @synch

**@type** (*optional*) Designation which characterizes the element in some sense, using any convenient classification scheme or typology that employs single-token labels. One or more values of datatype **NMTOKEN**, separated by spaces.

<choice> → [att.common](#) → [att.typed](#) → @type

**@xml:base** (*optional*) Provides a base URI reference with which applications can resolve relative URI references into absolute URI references. Value conforms to [data.URI](#).

<choice> → [att.common](#) → [att.basic](#) → @xml:base

**@xml:id** (*optional*) Regularizes the naming of an element and thus facilitates building links between it and other resources. Each id attribute within a document must have a unique value. Value is a valid [xml:id](#).

<choice> → [att.common](#) → [att.basic](#) → [att.id](#) → @xml:id

## Member of

[model.editLike](#) Groups elements for editorial interventions that may be useful both in transcribing and in authoring processes.

## Contained By

**<abbr>** A generic element for 1) a shortened form of a word, including an acronym or 2) a shorthand notation.

<choice> → [model.editLike](#) → <abbr>

**<add>** Marks an addition to the text.

<choice> → [model.editLike](#) → <add>

**<addName>** Contains an additional name component, such as a nickname, epithet, or alias, or any other descriptive phrase used within a personal name.

<choice> → [model.editLike](#) → <addName>

**<addrLine>** Single line of a postal address.

<choice> → [model.editLike](#) → <addrLine>

**<anchoredText>** Container for text that is fixed to a particular page location, regardless of changes made to the layout of the measures around it.

<choice> → [model.editLike](#) → <anchoredText>

**<annot>** Provides a statement explaining the text or indicating the basis for an assertion.

<choice> → [model.editLike](#) → <annot>

**<attacca>** An instruction to begin the next section or movement of a composition without pause.

<choice> → model.editLike → <attacca>

**<beam>** A container for a series of explicitly beamed events that begins and ends entirely within a measure.

<choice> → model.editLike → <beam>

**<bloc>** Contains the name of a geopolitical unit consisting of two or more nation states or countries.

<choice> → model.editLike → <bloc>

**<caption>** A label which accompanies an illustration or a table.

<choice> → model.editLike → <caption>

**<choice>** Groups a number of alternative encodings for the same point in a text.

<choice> → model.editLike → model.choicePart → <choice>

**<chord>** A simultaneous sounding of two or more notes in the same layer \*with the same duration\*.

<choice> → model.editLike → <chord>

**<contentItem>** Contains a single entry within a content description element.

<choice> → model.editLike → <contentItem>

**<corpName>** Identifies an organization or group of people that acts as a single entity.

<choice> → model.editLike → <corpName>

**<corr>** Contains the correct form of an apparent erroneous passage.

<choice> → model.editLike → <corr>

**<country>** Contains the name of a geopolitical unit, such as a nation, country, colony, or commonwealth, larger than or administratively superior to a region and smaller than a bloc.

<choice> → model.editLike → <country>

**<cpMark>** A verbal or graphical indication to copy musical material written elsewhere.

<choice> → model.editLike → <cpMark>

**<damage>** Contains an area of damage to the physical medium.

<choice> → model.editLike → <damage>

**<del>** Contains information deleted, marked as deleted, or otherwise indicated as superfluous or spurious in the copy text by an author, scribe, annotator, or corrector.

<choice> → model.editLike → <del>

**<desc>** Container for text that briefly describes the feature to which it is attached, including its intended usage, purpose, or application as appropriate.

<choice> → model.editLike → <desc>

**<dir>** An instruction expressed as a combination of text and symbols, typically above, below, or between staves, but not on the staff — that is not encoded elsewhere in more specific elements, like <tempo>, <dynam> or <repeatMark>.

<choice> → model.editLike → <dir>

**<district>** Contains the name of any kind of subdivision of a settlement, such as a parish, ward, or other administrative or geographic unit.

<choice> → model.editLike → <district>

**<dynam>** Indication of the volume of a note, phrase, or section of music.

<choice> → model.editLike → <dynam>

**<ending>** Alternative ending for a repeated passage of music; i.e., prima volta, seconda volta, etc.

<choice> → model.editLike → <ending>

**<epigraph>** Contains a quotation, anonymous or attributed, appearing on a title page.

<choice> → model.editLike → model.paracontentPart → <epigraph>

**<expan>** Contains the expansion of an abbreviation.

<choice> → model.editLike → <expan>

**<f>** Single element of a figured bass indication.

<choice> → model.editLike → <f>

**<famName>** Contains a family (inherited) name, as opposed to a given, baptismal, or nick name.

<choice> → model.editLike → <famName>

**<fb>** Symbols added to a bass line that indicate harmony. Used to improvise a chordal accompaniment. Sometimes called Generalbass, thoroughbass, or basso continuo.

<choice> → model.editLike → <fb>

**<fing>** finger – An individual finger in a fingering indication.

<choice> → model.editLike → <fing>

**<fingGrp>** (finger group)– A group of individual fingers in a fingering indication.

<choice> → model.editLike → <fingGrp>

**<foreName>** Contains a forename, given or baptismal name.

<choice> → model.editLike → <foreName>

**<genName>** Contains a name component used to distinguish otherwise similar names on the basis of the relative ages or generations of the persons named.

<choice> → model.editLike → <genName>

**<geogFeat>** Contains a common noun identifying a geographical feature.

<choice> → model.editLike → <geogFeat>

**<geogName>** The proper noun designation for a place, natural feature, or political jurisdiction.

<choice> → model.editLike → <geogName>

**<graceGrp>** A container for a sequence of grace notes.

<choice> → model.editLike → <graceGrp>

**<harm>** An indication of harmony, e.g., chord names, tablature grids, harmonic analysis, figured bass.

<choice> → model.editLike → <harm>

**<head>** Contains any heading, for example, the title of a section of text, or the heading of a list.

<choice> → model.editLike → <head>

**<identifier>** An alpha-numeric string that establishes the identity of the described material.

<choice> → model.editLike → <identifier>

**<imprimatur>** Contains a formal statement authorizing the publication of a work, sometimes required to appear on a title page or its verso.

<choice> → model.editLike → model.paracontentPart → <imprimatur>

**<l>** Contains a single line of text within a line group.

<choice> → model.editLike → <l>

**<label>** A container for document text that identifies the feature to which it is attached. For a "tool tip" or other generated label, use the label attribute.

<choice> → model.editLike → <label>

**<labelAbbr>** A label on the pages following the first.

<choice> → model.editLike → <labelAbbr>

**<layer>** An independent stream of events on a staff.

<choice> → model.editLike → <layer>

**<lem>** (lemma) – Contains the lemma, or base text, of a textual variation.

<choice> → model.editLike → <lem>

**<li>** Single item in a <list>.

<choice> → model.editLike → <li>

**<ligature>** A mensural notation symbol that combines two or more notes into a single sign.

<choice> → model.editLike → <ligature>

**<measure>** Unit of musical time consisting of a fixed number of note values of a given type, as determined by the prevailing meter, and delimited in musical notation by bar lines.

<choice> → model.editLike → <measure>

**<metaMark>** A graphical or textual statement with additional / explanatory information about the musical text. The textual consequences of this intervention are encoded independently via other means; that is, with elements such as <add>, <del>, etc.

<choice> → model.editLike → <metaMark>

**<name>** Proper noun or noun phrase.

<choice> → model.editLike → <name>

**<nameLink>** Contains a connecting phrase or link used within a name but not regarded as part of it, such as "van der" or "of", "from", etc.

<choice> → model.editLike → <nameLink>

**<nc>** Sign representing a single pitched event, although the exact pitch may not be known.

<choice> → model.editLike → <nc>

**<ncGrp>** Collection of one or more neume components.

<choice> → model.editLike → <ncGrp>

**<neume>** Sign representing one or more musical pitches.

<choice> → model.editLike → <neume>

**<note>** A single pitched event.

<choice> → model.editLike → <note>

**<num>** Numeric information in any form.

<choice> → model.editLike → <num>

**<oLayer>** A layer that contains an alternative to material in another layer.

<choice> → model.editLike → <oLayer>

**<oStaff>** A staff that holds an alternative passage which may be played instead of the original material.

<choice> → model.editLike → <oStaff>

**<orig>** Contains material which is marked as following the original, rather than being normalized or corrected.

<choice> → model.editLike → <orig>

**<ornam>** An element indicating an ornament that is not a mordent, turn, or trill.

<choice> → model.editLike → <ornam>

**<p>** One or more text phrases that form a logical prose passage.

<choice> → model.editLike → model.paracontentPart → <p>

**<part>** An alternative visual rendition of the score from the point of view of a particular performer (or group of performers).

<choice> → model.editLike → <part>

**<periodName>** A label that describes a period of time, such as 'Baroque' or '3rd Style period'.

<choice> → model.editLike → <periodName>

**<persName>** Designation for an individual, including any or all of that individual's forenames, surnames, honorific titles, and added names.

<choice> → model.editLike → <persName>

**<pgFoot>** A running footer.

<choice> → model.editLike → <pgFoot>

**<pgHead>** A running header.

<choice> → model.editLike → <pgHead>

**<postBox>** (postal box or post office box) contains a number or other identifier for some postal delivery point other than a street address.

<choice> → model.editLike → <postBox>

**<postCode>** (postal code) contains a numerical or alphanumeric code used as part of a postal address to simplify sorting or delivery of mail.

<choice> → model.editLike → <postCode>

**<quote>** Contains a paragraph-like block of text attributed to an external source, normally set off from the surrounding text by spacing or other typographic distinction.

<choice> → model.editLike → model.paracontentPart → <quote>

**<rdg>** (reading) – Contains a single reading within a textual variation.

<choice> → model.editLike → <rdg>

**<refrain>** Recurring lyrics, especially at the end of each verse or stanza of a poem or song lyrics; a chorus.

<choice> → model.editLike → <refrain>

**<reg>** Contains material which has been regularized or normalized in some sense.

<choice> → model.editLike → <reg>

**<region>** Contains the name of an administrative unit such as a state, province, or county, larger than a settlement, but smaller than a country.

<choice> → model.editLike → <region>

**<rend>** A formatting element indicating special visual rendering, e.g., bold or italicized, of a text word or phrase.

<choice> → model.editLike → <rend>

**<repeatMark>** An instruction expressed as a combination of text and symbols – segno and coda – typically above, below, or between staves, but not on the staff.

<choice> → model.editLike → <repeatMark>

**<rest>** A non-sounding event found in the source being transcribed.

<choice> → model.editLike → <rest>

**<restore>** Indicates restoration of material to an earlier state by cancellation of an editorial or authorial marking or instruction.

<choice> → model.editLike → <restore>

**<roleName>** Contains a name component which indicates that the referent has a particular role or position in society, such as an official title or rank.

<choice> → model.editLike → <roleName>

**<score>** Full score view of the musical content.

<choice> → model.editLike → <score>

**<section>** Segment of music data.

<choice> → model.editLike → <section>

**<seg>** (arbitrary segment) represents any segmentation of text below the "text component" level.

<choice> → model.editLike → <seg>

**<settlement>** Contains the name of a settlement such as a city, town, or village identified as a single geopolitical or administrative unit.

<choice> → model.editLike → <settlement>

**<sic>** Contains apparently incorrect or inaccurate material.

<choice> → model.editLike → <sic>

**<signifLet>** Significantive letter(s).

<choice> → model.editLike → <signifLet>

**<speaker>** Contains a specialized form of heading or label, giving the name of one or more speakers in a dramatic text or fragment.

<choice> → model.editLike → <speaker>

**<staff>** A group of equidistant horizontal lines on which notes are placed in order to represent pitch or a grouping element for individual 'strands' of notes, rests, etc. that may or may not actually be rendered on staff lines; that is, both diastematic and non-diastematic signs.

<choice> → model.editLike → <staff>

**<stageDir>** Contains any kind of stage direction within a dramatic text or fragment.

<choice> → model.editLike → <stageDir>

**<street>** full street address including any name or number identifying a building as well as the name of the street or route on which it is located.

<choice> → model.editLike → <street>

**<styleName>** A label for a characteristic style of writing or performance, such as 'bebop' or 'rock-n-roll'.

<choice> → model.editLike → <styleName>

**<supplied>** Contains material supplied by the transcriber or editor for any reason.

<choice> → model.editLike → <supplied>

**<syl>** Individual lyric syllable.

<choice> → model.editLike → <syl>

**<syllable>** Neume notation can be thought of as "neumed text". Therefore, the syllable element provides high-level organization in this repertoire.

<choice> → model.editLike → <syllable>

**<td>** Designates a table cell that contains data as opposed to a cell that contains column or row heading information.

<choice> → model.editLike → <td>

**<tempo>** Text and symbols descriptive of tempo, mood, or style, e.g., "allarg.", "a tempo", "cantabile", "Moderato", "J=60", "Moderato J =60").

<choice> → model.editLike → <tempo>

**<th>** Designates a table cell containing column or row heading information as opposed to one containing data.

<choice> → model.editLike → <th>

**<title>** Title of a bibliographic entity.

<choice> → model.editLike → <title>

**<titlePart>** Contains a subsection or division of the title of a bibliographic entity.

<choice> → model.editLike → <titlePart>

**<tuplet>** A group of notes with "irregular" (sometimes called "irrational") rhythmic values, for example, three notes in the time normally occupied by two or nine in the time of five.

<choice> → model.editLike → <tuplet>

**<unclear>** Contains material that cannot be transcribed with certainty because it is illegible or inaudible in the source.

<choice> → model.editLike → <unclear>

**<verse>** Division of a poem or song lyrics, sometimes having a fixed length, meter or rhyme scheme; a stanza.

<choice> → model.editLike → <verse>

**<volta>** Sung text for a specific iteration of a repeated section of music.

<choice> → model.editLike → <volta>

## May Contain

**<abbr>** A generic element for 1) a shortened form of a word, including an acronym or 2) a shorthand notation.

<choice> → model.choicePart → model.editorialLike → <abbr>

**<choice>** Groups a number of alternative encodings for the same point in a text.

<choice> → model.choicePart → model.editLike → <choice>

**<corr>** Contains the correct form of an apparent erroneous passage.

<choice> → model.choicePart → <corr>

**<expan>** Contains the expansion of an abbreviation.

<choice> → model.choicePart → model.editorialLike → <expan>

**<orig>** Contains material which is marked as following the original, rather than being normalized or corrected.

<choice> → model.choicePart → <orig>

**<reg>** Contains material which has been regularized or normalized in some sense.

<choice> → model.choicePart → <reg>

**<sic>** Contains apparently incorrect or inaccurate material.

<choice> → model.choicePart → <sic>

**<subst>** Groups transcriptional elements when the combination is to be regarded as a single intervention in the text.

<choice> → model.choicePart → model.editLike → <subst>

**<unclear>** Contains material that cannot be transcribed with certainty because it is illegible or inaudible in the source.

<choice> → model.choicePart → <unclear>

## Remarks

Because the children of a <choice> element all represent alternative ways of encoding the same sequence, it is natural to think of them as mutually exclusive. However, there may be cases where a full representation of a text requires the alternative encodings to be considered as parallel. Note also that <choice> elements may be recursively nested.

The model of this element is based on the choice element of the Text Encoding Initiative (TEI).

```

## <chord>

A simultaneous sounding of two or more notes in the same layer \*with the same duration\*.

### Referenced in chapters

[1.2.2 Events and Controlevents](#), [2.2.3 Basic Music Events](#), [4.2.5.1.2 Grace Notes](#), [4.2.5.2.1 Chords in CMN](#), [4.2.5.2.2 Stem Modifications](#), [4.2.5.3 Rests](#), [4.3.1 Beams](#), [4.3.2 Ties, Slurs and Phrase Marks](#), [4.3.5.1 Arpeggio and Glissando](#), [4.3.5.3 Tremoland](#), [4.3.5.4 Fermata](#), [4.3.6.3 Piano Pedal](#), [10.1.2.3 Harmonic Intervals](#), [10.2.1 Indications of Harmony](#)

### Module

[MEI.shared](#)

### Attributes

**@altsym** (*optional*) Provides a way of pointing to a user-defined symbol. It must contain a reference to an ID of a [`<symbolDef>`](#) element elsewhere in the document. Value conforms to [data.URI](#).

`<chord> → att.chord.vis → att.altSym → @altsym`

**@artic** (*optional*) Encodes the written articulation(s). Articulations are normally encoded in order from the note head outward; that is, away from the stem. See additional notes at `att.vis.note`. Only articulations should be encoded in the `artic` attribute; for example, fingerings should be encoded using the [`<fing>`](#) element. One or more values from [data.ARTICULATION](#), separated by spaces.

`<chord> → att.chord.log → att.articulation → @artic`

**@artic.ges** (*optional*) Records performed articulation that differs from the written value. One or more values from [data.ARTICULATION](#), separated by spaces.

`<chord> → att.chord.ges → att.articulation.ges → @artic.ges`

**@beam** (*optional*) Indicates that this event is "under a beam". One or more values from [data.BEAM](#), separated by spaces.

`<chord> → att.chord.anl → att.chord.anl.cmn → att.beamPresent → @beam`

**@breaksec** (*optional*) Presence of this attribute indicates that the secondary beam should be broken following this note/chord. The value of the attribute records the number of beams which should remain unbroken. Value is a positive integer.

`<chord> → att.chord.vis → att.chord.vis.cmn → att.beamSecondary → @breaksec`

**@class** (*optional*) Contains one or more URIs which denote classification terms that apply to the entity bearing this attribute. One or more values from [data.URI](#), separated by spaces.

`<chord> → att.common → att.typed → att.classed → @class`

**@cluster** (*optional*) Indicates a single, alternative note head should be displayed instead of individual note heads. The highest and lowest notes of the chord usually indicate the upper and lower boundaries of the cluster note head. Value conforms to [data.CLUSTER](#).

`<chord> → att.chord.vis → @cluster`

**@color** (*optional*) Used to indicate visual appearance. Do not confuse this with the musical term 'color' as used in pre-CMN notation. Value conforms to [data.COLOR](#).

`<chord> → att.chord.vis → att.color → @color`

**@copyof** (*optional*) Points to an element of which the current element is a copy. Value conforms to [data.URI](#).

<chord> → att.common → att.linkin → @copyof

**@corresp** (*optional*) Used to point to other elements that correspond to this one in a generic fashion. One or more values from [data.URI](#), separated by spaces.

<chord> → att.common → att.linkin → @corresp

**@cue** (*optional*) Value conforms to [data.BOOLEAN](#).

<chord> → att.chord.log → att.cue → @cue

**@dots** (*optional*) Records the number of augmentation dots required by a written dotted duration. Value conforms to [data.AUGMENTDOT](#).

<chord> → att.chord.log → att.augmentDots → @dots

**@dots.ges** (*optional*) Number of dots required for a gestural duration when different from that of the written duration. Value conforms to [data.AUGMENTDOT](#).

<chord> → att.chord.ges → att.duration.ges → @dots.ges

**@dur** (*optional*) Records the duration of a feature using the relative durational values provided by the [data.DURATION](#) datatype. Value conforms to [data.DURATION](#).

<chord> → att.chord.log → att.duration.log → @dur

**@dur.ges** (*optional*) Records performed duration information that differs from the written duration. Value conforms to [data.DURATION.GESTURAL](#).

<chord> → att.chord.ges → att.duration.ges → @dur.ges

**@dur.metrical** (*optional*) Duration as a count of units provided in the time signature denominator. Value is a decimal number.

<chord> → att.chord.ges → att.duration.ges → @dur.metrical

**@dur.ppq** (*optional*) Duration recorded as pulses-per-quarter note, e.g., MIDI clicks or MusicXML divisions. Value is a positive integer, including 0.

<chord> → att.chord.ges → att.duration.ges → @dur.ppq

**@dur.real** (*optional*) Duration in seconds, e.g., 1.732. Value is a decimal number.

<chord> → att.chord.ges → att.duration.ges → @dur.real

**@dur.recip** (*optional*) Duration as an optionally dotted [Humdrum](#) **\*\*recip** value. Value is a [token](#).

<chord> → att.chord.ges → att.duration.ges → @dur.recip

**@enclose** (*optional*) Records the characters often used to mark accidentals, articulations, and sometimes notes as having a cautionary or editorial function. For an example of cautionary accidentals enclosed in parentheses, see Read, p. 131, ex. 9-14. Value conforms to [data.ENCLOSURE](#).

<chord> → att.chord.vis → att.enclosingChars → @enclose

**@facs** (*optional*) Points to one or more images, portions of an image, or surfaces which correspond to the current element. One or more values from [data.URI](#), separated by spaces.

<chord> → att.facsimile → @facs

**@fermata** (*optional*) Indicates the attachment of a fermata to this element. If visual information about the fermata needs to be recorded, then a [<fermata>](#) element should be employed instead. Value conforms to [data.STAFFREL.basic](#).

<chord> → att.chord.anl → att.chord.anl.cmn → att.fermataPresent → @fermata

**@follows** (*optional*) points to one or more events in a user-defined collection that are known to be predecessors of the current element. One or more values from [data.URI](#), separated by spaces.

<chord> → att.common → att.linkin → @follows

**@fontfam** (*optional*) Contains the name of a font-family. Value conforms to [data.FONTFAMILY](#).

<chord> → att.chord.vis → att.typography → @fontfam

**@fontname** (*optional*) Holds the name of a font. Value conforms to [data.FONTNAME](#).

<chord> → att.chord.vis → att.typography → @fontname

**@fontsize** (*optional*) Indicates the size of a font expressed in printers' points, i.e., 1/72nd of an inch, relative terms, e.g., small, larger, etc., or percentage values relative to normal size, e.g., 125%. Value conforms to [data.FONTSIZE](#).

<chord> → att.chord.vis → att.typography → @fontsize

**@fontstyle** (*optional*) Records the style of a font, i.e., italic, oblique, or normal. Value conforms to [data.FONTSTYLE](#).

<chord> → att.chord.vis → att.typography → @fontstyle

**@fontweight** (*optional*) Used to indicate bold type. Value conforms to [data.FONTWEIGHT](#).

<chord> → att.chord.vis → att.typography → @fontweight

**@glyph.auth** (*optional*) A name or label associated with the controlled vocabulary from which the value of `glyph.name` or `glyph.num` is taken, or the textual content of the element. Allowed values are: "**smufl**" (*Standard Music Font Layout*.)

<chord> → att.chord.vis → att.extSym → att.extSym.auth → @glyph.auth

**@glyph.name** (*optional*) Glyph name. Value is plain text.

<chord> → att.chord.vis → att.extSym → att.extSym.names → @glyph.name

**@glyph.num** (*optional*) Numeric glyph reference in hexadecimal notation, e.g., "#xE000" or "U+E000". N.B. SMuFL version 1.18 uses the range U+E000 - U+ECBF. Value conforms to [data.HEXNUM](#).

<chord> → att.chord.vis → att.extSym → att.extSym.names → @glyph.num

**@glyph.uri** (*optional*) The web-accessible location of the controlled vocabulary from which the value of `glyph.name` or `glyph.num` is taken, or the textual content of the element. Value conforms to [data.URI](#).

<chord> → att.chord.vis → att.extSym → att.extSym.auth → @glyph.uri

**@grace** (*optional*) Marks a note or chord as a "grace" (without a definite performed duration) and records from which other note/chord it should "steal" time. Value conforms to [data.GRACE](#).

<chord> → att.chord.log → att.chord.log.cmn → att.graced → @grace

**@grace.time** (*optional*) Records the amount of time to be "stolen" from a non-grace note/chord. Value conforms to [data.PERCENT](#).

<chord> → att.chord.log → att.chord.log.cmn → att.graced → @grace.time

**@ho** (*optional*) Records a horizontal adjustment to a feature's programmatically-determined location in terms of staff interline distance; that is, in units of 1/2 the distance between adjacent staff lines. Value conforms to [data.MEASUREMENTSIGNED](#).

<chord> → att.chord.vis → att.visualOffset.ho → @ho

**@instr** (*optional*) Provides a way of pointing to a MIDI instrument definition. It must contain the ID of an `<instrDef>` element elsewhere in the document. Value conforms to [data.URI](#).

<chord> → att.chord.ges → att.instrumentIdent → @instr

**@label** (*optional*) Captures text to be used to generate a label for the element to which it's attached, a "tool tip" or prefatory text, for example. Should not be used to record document content. Value is plain text.

<chord> → att.common → att.labelled → @label

**@layer** (*optional*) Identifies the layer to which a feature applies. One or more values of datatype **positiveInteger**, separated by spaces.

<chord> → att.chord.log → att.event → att.layerIdent → @layer

**@letterspacing** (*optional*) Indicates letter spacing (aka tracking) in analogy to the CSS letter-spacing property. Value conforms to [data.MEASUREMENTTYPOGRAPHYSIGNED](#).

<chord> → att.chord.vis → att.typography → @letterspacing

**@lineheight** (*optional*) Indicates line height in analogy to the CSS line-height property. Value conforms to either [data.MEASUREMENTTYPOGRAPHYUNSIGNED](#) or [data.PERCENT](#).

<chord> → att.chord.vis → att.typography → @lineheight

**@lv** (*optional*) Indicates the attachment of an l.v. (laissez vibrer) sign to this element. Value conforms to [data.BOOLEAN](#).

<chord> → att.chord.anl → att.chord.anl.cmn → att.lvPresent → @lv

**@n** (*optional*) Provides a number-like designation that indicates an element's position in a sequence of similar elements. May not contain space characters. Value conforms to [data.WORD](#).

<chord> → att.common → att.nNumberLike → @n

**@next** (*optional*) Used to point to the next event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<chord> → att.common → att.linked → @next

**@ornam** (*optional*) Indicates that this element has an attached ornament. If visual information about the ornament is needed, then one of the elements that represents an ornament (mordent, trill, or turn) should be employed. One or more values from [data.ORNAM.cmn](#), separated by spaces.

<chord> → att.chord.anl → att.chord.anl.cmn → att.ornamPresent → @ornam

**@precedes** (*optional*) Points to one or more events in a user-defined collection that are known to be successors of the current element. One or more values from [data.URI](#), separated by spaces.

<chord> → att.common → att.linked → @precedes

**@prev** (*optional*) Points to the previous event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<chord> → att.common → att.linked → @prev

**@resp** (*optional*) Indicates the agent(s) responsible for some aspect of the text's transcription, editing, or encoding. Its value must point to one or more identifiers declared in the document header. One or more values from [data.URI](#), separated by spaces.

<chord> → att.common → att.responsibility → @resp

**@sameas** (*optional*) Points to an element that is the same as the current element but is not a literal copy of the current element. One or more values from [data.URI](#), separated by spaces.

<chord> → att.common → att.linked → @sameas

**@slur** (*optional*) Indicates that this element participates in a slur. If visual information about the slur needs to be recorded, then a <slur> element should be employed. One or more values from [data.SLUR](#), separated by spaces.

<chord> → att.chord.anl → att.chord.anl.cmn → att.slurPresent → @slur

**@staff** (*recommended*) Signifies the staff on which a notated event occurs or to which a control event applies. Mandatory when applicable. One or more values of datatype **positiveInteger**, separated by spaces.

<chord> → att.chord.log → att.event → att.staffIdent → @staff

**@stem.dir** (*optional*) Describes the direction of a stem. Value conforms to [data.STEMDIRECTION](#).

<chord> → att.chord.vis → att.stems → @stem.dir

**@stem.form** (*optional*) Records the form of the stem. Value conforms to [data.STEMFORM.mensural](#).

<chord> → att.chord.vis → att.stems → att.stems.mensural → @stem.form

**@stem.len** (*optional*) Encodes the stem length. Value conforms to [data.MEASUREMENTUNSIGNED](#).

<chord> → att.chord.vis → att.stems → @stem.len

**@stem.mod** (*optional*) Encodes any stem "modifiers"; that is, symbols rendered on the stem, such as tremolo or Sprechstimme indicators. Value conforms to [data.STEMMODIFIER](#).

<chord> → att.chord.vis → att.stems → @stem.mod

**@stem.pos** (*optional*) Records the position of the stem in relation to the note head(s). Value conforms to [data.STEMPOSITION](#).

<chord> → att.chord.vis → att.stems → @stem.pos

**@stem.sameas** (*optional*) Points to a note element in a different layer whose stem is shared. The linked notes should be rendered like a chord though they are part of different layers. Value conforms to [data.URI](#).

<chord> → att.chord.vis → att.stems → @stem.sameas

**@stem.visible** (*optional*) Determines whether a stem should be displayed. Value conforms to [data.BOOLEAN](#).

<chord> → att.chord.vis → att.stems → @stem.visible

**@stem.with** (*optional*) Contains an indication of which staff a note or chord that logically belongs to the current staff should be visually placed on; that is, the one above or the one below. Value conforms to [data.NEIGHBORINGLAYER](#).

<chord> → att.chord.vis → att.stems → att.stems.cmn → @stem.with

**@stem.x** (*optional*) Records the output x coordinate of the stem's attachment point. Value is a decimal number.

<chord> → att.chord.vis → att.stems → @stem.x

**@stem.y** (*optional*) Records the output y coordinate of the stem's attachment point. Value is a decimal number.

<chord> → att.chord.vis → att.stems → @stem.y

**@syl** (*optional*) Holds an associated sung text syllable. Value is plain text.

<chord> → att.chord.log → att.sylText → @syl

**@synch** (*optional*) Points to elements that are synchronous with the current element. One or more values from [data.URI](#), separated by spaces.

<chord> → att.common → att.linking → @synch

**@tie** (*optional*) Indicates that this element participates in a tie. If visual information about the tie needs to be recorded, then a <tie> element should be employed. One or more values from [data.TIE](#), separated by spaces.

<chord> → att.chord.anl → att.chord.anl.cmn → att.tiePresent → @tie

**@to** (*optional*) Records a timestamp adjustment of a feature's programmatically-determined location in terms of musical time; that is, beats. Value conforms to [data.TSTAMPOFFSET](#).

<chord> → att.chord.vis → att.visualOffset.to → @to

**@tstamp** (*optional*) Encodes the onset time in terms of musical time, i.e., beats[.fractional beat part], as expressed in the written time signature. Value conforms to [data.BEAT](#).

<chord> → att.chord.log → att.event → att.timestamp.log → @tstamp

**@tstamp.ges** (*optional*) Encodes the onset time in terms of musical time, i.e., beats[.fractional beat part], as expressed in the written time signature. Value conforms to [data.BEAT](#).

<chord> → att.chord.log → att.event → att.timestamp.ges → @tstamp.ges

**@tstamp.real** (*optional*) Records the onset time in terms of ISO time. Value conforms to [data.ISOTIME](#).

<chord> → att.chord.log → att.event → att.timestamp.ges → @tstamp.real

**@tuplet** (*optional*) Indicates that this feature participates in a tuplet. If visual information about the tuplet needs to be recorded, then a <tuplet> element should be employed. One or more values from [data.TUPLET](#), separated by spaces.

<chord> → att.chord.anl → att.chord.anl.cmn → att.tupletPresent → @tuplet

**@type** (*optional*) Designation which characterizes the element in some sense, using any convenient classification scheme or typology that employs single-token labels. One or more values of datatype [NMOKEN](#), separated by spaces.

<chord> → att.common → att.typed → @type

**@visible** (*optional*) Indicates if a feature should be rendered when the notation is presented graphically or sounded when it is presented in an aural form. Value conforms to [data.BOOLEAN](#).

<chord> → att.chord.vis → att.visibility → @visible

**@when** (*optional*) Indicates the point of occurrence of this feature along a time line. Its value must be the ID of a <when> element elsewhere in the document. Value conforms to [data.URI](#).

<chord> → att.chord.log → att.event → att.alignment → @when

**@x** (*optional*) Encodes an x coordinate for a feature in an output coordinate system. When it is necessary to record the placement of a feature in a facsimile image, use the facets attribute. Value is a decimal number.

<chord> → att.chord.vis → att.xy → @x

**@xml:base** (*optional*) Provides a base URI reference with which applications can resolve relative URI references into absolute URI references. Value conforms to [data.URI](#).

<chord> → att.common → att.basic → @xml:base

**@xml:id** (*optional*) Regularizes the naming of an element and thus facilitates building links between it and other resources. Each id attribute within a document must have a unique value. Value is a valid [xml:id](#).

<chord> → att.common → att.basic → att.id → @xml:id

**@y** (*optional*) Encodes a y coordinate for a feature in an output coordinate system. When it is necessary to record the placement of a feature in a facsimile image, use the facets attribute. Value is a decimal number.

<chord> → att.chord.vis → att.xy → @y

## Member of

[model.eventLike](#) Groups event elements that occur in all notational repertoires.

### Contained By

**<abbr>** A generic element for 1) a shortened form of a word, including an acronym or 2) a shorthand notation.

<chord> → [model.eventLike](#) → [model.layerPart](#) → <abbr>

**<add>** Marks an addition to the text.

<chord> → [model.eventLike](#) → [model.layerPart](#) → <add>

**<bTrem>** A rapid alternation on a single pitch or chord.

<chord> → elements having chord as direct children → <bTrem>

**<beam>** A container for a series of explicitly beamed events that begins and ends entirely within a measure.

<chord> → [model.eventLike](#) → <beam>

**<corr>** Contains the correct form of an apparent erroneous passage.

<chord> → [model.eventLike](#) → [model.layerPart](#) → <corr>

**<damage>** Contains an area of damage to the physical medium.

<chord> → [model.eventLike](#) → [model.layerPart](#) → <damage>

**<del>** Contains information deleted, marked as deleted, or otherwise indicated as superfluous or spurious in the copy text by an author, scribe, annotator, or corrector.

<chord> → [model.eventLike](#) → [model.layerPart](#) → <del>

**<expan>** Contains the expansion of an abbreviation.

<chord> → [model.eventLike](#) → [model.layerPart](#) → <expan>

**<fTrem>** A rapid alternation between a pair of notes (or chords or perhaps between a note and a chord) that are (usually) farther apart than a major second.

<chord> → elements having chord as direct children → <fTrem>

**<graceGrp>** A container for a sequence of grace notes.

<chord> → [model.eventLike](#) → <graceGrp>

**<layer>** An independent stream of events on a staff.

<chord> → [model.eventLike](#) → [model.layerPart](#) → <layer>

**<lem>** (lemma) – Contains the lemma, or base text, of a textual variation.

<chord> → [model.eventLike](#) → [model.layerPart](#) → <lem>

**<ligature>** A mensural notation symbol that combines two or more notes into a single sign.

<chord> → [model.eventLike](#) → <ligature>

**<oLayer>** A layer that contains an alternative to material in another layer.

<chord> → [model.eventLike](#) → [model.layerPart](#) → <oLayer>

**<orig>** Contains material which is marked as following the original, rather than being normalized or corrected.

<chord> → [model.eventLike](#) → [model.layerPart](#) → <orig>

**<rdg>** (reading) – Contains a single reading within a textual variation.

<chord> → [model.eventLike](#) → [model.layerPart](#) → <rdg>

**<reg>** Contains material which has been regularized or normalized in some sense.

<chord> → [model.eventLike](#) → [model.layerPart](#) → <reg>

**<restore>** Indicates restoration of material to an earlier state by cancellation of an editorial or authorial marking or instruction.

<chord> → model.eventLike → model.layerPart → <restore>

**<sic>** Contains apparently incorrect or inaccurate material.

<chord> → model.eventLike → model.layerPart → <sic>

**<supplied>** Contains material supplied by the transcriber or editor for any reason.

<chord> → model.eventLike → model.layerPart → <supplied>

**<tuplet>** A group of notes with "irregular" (sometimes called "irrational") rhythmic values, for example, three notes in the time normally occupied by two or nine in the time of five.

<chord> → model.eventLike → <tuplet>

**<unclear>** Contains material that cannot be transcribed with certainty because it is illegible or inaudible in the source.

<chord> → model.eventLike → model.layerPart → <unclear>

## May Contain

**<add>** Marks an addition to the text.

<chord> → model.transcriptionLike → <add>

**<app>** (apparatus) – Contains one or more alternative encodings.

<chord> → model.appLike → <app>

**<artic>** An indication of how to play a note or chord.

<chord> → model.chordPart → <artic>

**<choice>** Groups a number of alternative encodings for the same point in a text.

<chord> → model.editLike → <choice>

**<corr>** Contains the correct form of an apparent erroneous passage.

<chord> → model.transcriptionLike → <corr>

**<damage>** Contains an area of damage to the physical medium.

<chord> → model.transcriptionLike → <damage>

**<del>** Contains information deleted, marked as deleted, or otherwise indicated as superfluous or spurious in the copy text by an author, scribe, annotator, or corrector.

<chord> → model.transcriptionLike → <del>

**<gap>** Indicates a point where material has been omitted in a transcription, whether as part of sampling practice or for editorial reasons described in the MEI header.

<chord> → model.transcriptionLike → <gap>

**<handShift>** Marks the beginning of a passage written in a new hand, or of a change in the scribe, writing style, ink or character of the document hand.

<chord> → model.transcriptionLike → <handShift>

**<note>** A single pitched event.

<chord> → model.chordPart → <note>

**<orig>** Contains material which is marked as following the original, rather than being normalized or corrected.

<chord> → model.transcriptionLike → <orig>

**<refrain>** Recurring lyrics, especially at the end of each verse or stanza of a poem or song lyrics; a chorus.

<chord> → model.verseLike → <refrain>

**<reg>** Contains material which has been regularized or normalized in some sense.

<chord> → model.transcriptionLike → <reg>

**<restore>** Indicates restoration of material to an earlier state by cancellation of an editorial or authorial marking or instruction.

<chord> → model.transcriptionLike → <restore>

**<sic>** Contains apparently incorrect or inaccurate material.

<chord> → model.transcriptionLike → <sic>

**<subst>** Groups transcriptional elements when the combination is to be regarded as a single intervention in the text.

<chord> → model.editLike → <subst>

**<supplied>** Contains material supplied by the transcriber or editor for any reason.

<chord> → model.transcriptionLike → <supplied>

**<syl>** Individual lyric syllable.

<chord> → model.sylLike → <syl>

**<unclear>** Contains material that cannot be transcribed with certainty because it is illegible or inaudible in the source.

<chord> → model.transcriptionLike → <unclear>

**<verse>** Division of a poem or song lyrics, sometimes having a fixed length, meter or rhyme scheme; a stanza.

<chord> → model.verseLike → <verse>

## <chordDef>

(chord definition) – Chord tablature definition.

### Referenced in chapters

[10.2.1.1 Interpreted Chord Data in scoreDef](#), [10.2.1.2 Chord Tablature Grids](#)

### Module

[MEI.harmony](#)

### Attributes

**@class** (*optional*) Contains one or more URIs which denote classification terms that apply to the entity bearing this attribute. One or more values from [data.URI](#), separated by spaces.

<chordDef> → att.common → att.typed → att.classest → @class

**@copyof** (*optional*) Points to an element of which the current element is a copy. Value conforms to [data.URI](#).

<chordDef> → att.common → att.linking → @copyof

**@corresp** (*optional*) Used to point to other elements that correspond to this one in a generic fashion. One or more values from [data.URI](#), separated by spaces.

<chordDef> → att.common → att.linking → @corresp

**@follows** (*optional*) points to one or more events in a user-defined collection that are known to be predecessors of the current element. One or more values from [data.URI](#), separated by spaces.

<chordDef> → att.common → att.linking → @follows

**@label** (*optional*) Captures text to be used to generate a label for the element to which it's attached, a "tool tip" or prefatory text, for example. Should not be used to record document content. Value is plain text.

<chordDef> → att.common → att.labelled → @label

**@n** (*optional*) Provides a number-like designation that indicates an element's position in a sequence of similar elements. May not contain space characters. Value conforms to [data.WORD](#).

<chordDef> → att.common → att.nNumberLike → @n

**@next** (*optional*) Used to point to the next event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<chordDef> → att.common → att.linking → @next

**@precedes** (*optional*) Points to one or more events in a user-defined collection that are known to be successors of the current element. One or more values from [data.URI](#), separated by spaces.

<chordDef> → att.common → att.linking → @precedes

**@prev** (*optional*) Points to the previous event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<chordDef> → att.common → att.linking → @prev

**@resp** (*optional*) Indicates the agent(s) responsible for some aspect of the text's transcription, editing, or encoding. Its value must point to one or more identifiers declared in the document header. One or more values from [data.URI](#), separated by spaces.

<chordDef> → att.common → att.responsibility → @resp

**@sameas** (*optional*) Points to an element that is the same as the current element but is not a literal copy of the current element. One or more values from [data.URI](#), separated by spaces.

<chordDef> → att.common → att.linkin → @sameas

**@synch** (*optional*) Points to elements that are synchronous with the current element. One or more values from [data.URI](#), separated by spaces.

<chordDef> → att.common → att.linkin → @synch

**@tab.pos** (*optional*) Records fret position. Value is a positive integer.

<chordDef> → att.chordDef.log → att.stringtab.position → @tab.pos

**@tab.strings** (*optional*) Provides a \*written\* pitch and octave for each open string or course of strings. One or more values conforming to the pattern "[a-

g][0-9](s|f|ss|x|ff|xs|sx|ts|tf|n|nf|ns|su|sd|fu|fd|nu|nd|1qf|3qf|1qs|3qs)?([a-g][0-9](s|f|ss|x|ff|xs|sx|ts|tf|n|nf|ns|su|sd|fu|fd|nu|nd|1qf|3qf|1qs|3qs)?)\*".

<chordDef> → att.chordDef.log → att.stringtab.tuning → @tab.strings

**@type** (*optional*) Designation which characterizes the element in some sense, using any convenient classification scheme or typology that employs single-token labels. One or more values of datatype **NMTOKEN**, separated by spaces.

<chordDef> → att.common → att.typed → @type

**@xml:base** (*optional*) Provides a base URI reference with which applications can resolve relative URI references into absolute URI references. Value conforms to [data.URI](#).

<chordDef> → att.common → att.basic → @xml:base

**@xml:id** (*optional*) Regularizes the naming of an element and thus facilitates building links between it and other resources. Each id attribute within a document must have a unique value. Value is a valid [xml:id](#).

<chordDef> → att.common → att.basic → att.id → @xml:id

## Member of

(chordDef isn't member of any model class)

## Contained By

**<chordTable>** Chord/tablature look-up table.

<chordDef> → elements having chordDef as direct children → <chordTable>

## May Contain

**<barre>** A barre in a chord tablature grid.

<chordDef> → direct children → <barre>

**<chordMember>** An individual pitch in a chord defined by a <chordDef> element.

<chordDef> → direct children → <chordMember>

## Remarks

An xml:id attribute, while not required by the schema, is needed so that <harm> elements can reference a particular chord definition. The pos (position) attribute is provided in order to create displayable chord tablature grids. <chordMember> sub-elements record the individual pitches of the chord. <barre> sub-elements may be used when a single finger is used to stop multiple strings.

## Declaration

```

## <chordMember>

An individual pitch in a chord defined by a <chordDef> element.

### Referenced in chapters

[10.2.1.1 Interpreted Chord Data in scoreDef](#), [10.2.1.2 Chord Tablature Grids](#)

### Module

[MEI.harmony](#)

### Attributes

**@accid.ges** (*optional*) Records the performed pitch inflection. Value conforms to [data.ACIDENTAL.GESTURAL](#).

<chordMember> → att.chordMember.ges → att.accidental.ges → @accid.ges

**@class** (*optional*) Contains one or more URIs which denote classification terms that apply to the entity bearing this attribute. One or more values from [data.URI](#), separated by spaces.

<chordMember> → att.common → att.typed → att.classed → @class

**@copyof** (*optional*) Points to an element of which the current element is a copy. Value conforms to [data.URI](#).

<chordMember> → att.common → att.linked → @copyof

**@corresp** (*optional*) Used to point to other elements that correspond to this one in a generic fashion. One or more values from [data.URI](#), separated by spaces.

<chordMember> → att.common → att.linked → @corresp

**@follows** (*optional*) points to one or more events in a user-defined collection that are known to be predecessors of the current element. One or more values from [data.URI](#), separated by spaces.

<chordMember> → att.common → att.linked → @follows

**@inth** (*optional*) Encodes the harmonic interval between pitches occurring at the same time. One or more values from [data.INTERVAL.HARMONIC](#), separated by spaces.

<chordMember> → att.chordMember.anl → att.intervalHarmonic → @inth

**@label** (*optional*) Captures text to be used to generate a label for the element to which it's attached, a "tool tip" or prefatory text, for example. Should not be used to record document content. Value is plain text.

<chordMember> → att.common → att.labelled → @label

**@n** (*optional*) Provides a number-like designation that indicates an element's position in a sequence of similar elements. May not contain space characters. Value conforms to [data.WORD](#).

<chordMember> → att.common → att.nNumberLike → @n

**@next** (*optional*) Used to point to the next event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<chordMember> → att.common → att.linked → @next

**@oct** (*optional*) Captures written octave information. Value conforms to [data.OCTAVE](#).

<chordMember> → att.chordMember.log → att.pitched → att.octave → @oct

**@pname** (*optional*) Contains a written pitch name. Value conforms to [data.PITCHNAME](#).

<chordMember> → att.chordMember.log → att.pitched → att.pitch → @pname

**@precedes** (*optional*) Points to one or more events in a user-defined collection that are known to be successors of the current element. One or more values from [data.URI](#), separated by spaces.

<chordMember> → att.common → att.linkin → @precedes

**@prev** (*optional*) Points to the previous event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<chordMember> → att.common → att.linkin → @prev

**@resp** (*optional*) Indicates the agent(s) responsible for some aspect of the text's transcription, editing, or encoding. Its value must point to one or more identifiers declared in the document header. One or more values from [data.URI](#), separated by spaces.

<chordMember> → att.common → att.responsibility → @resp

**@sameas** (*optional*) Points to an element that is the same as the current element but is not a literal copy of the current element. One or more values from [data.URI](#), separated by spaces.

<chordMember> → att.common → att.linkin → @sameas

**@synch** (*optional*) Points to elements that are synchronous with the current element. One or more values from [data.URI](#), separated by spaces.

<chordMember> → att.common → att.linkin → @synch

**@tab.fing** (*optional*) Indicates which finger, if any, should be used to play an individual string. The index, middle, ring, and little fingers are represented by the values 1-4, while t is for the thumb. The values x and o indicate muffled and open strings, respectively. Value conforms to [data.FINGER.FRET](#).

<chordMember> → att.chordMember.log → att.stringtab → @tab.fing

**@tab.fret** (*optional*) Records the location at which a string should be stopped against a fret. Value conforms to [data.FRETNUMBER](#).

<chordMember> → att.chordMember.log → att.stringtab → @tab.fret

**@tab.string** (*optional*) Records which string is to be played. Value conforms to [data.STRINGNUMBER](#).

<chordMember> → att.chordMember.log → att.stringtab → @tab.string

**@type** (*optional*) Designation which characterizes the element in some sense, using any convenient classification scheme or typology that employs single-token labels. One or more values of datatype **NMTOKEN**, separated by spaces.

<chordMember> → att.common → att.type → @type

**@xml:base** (*optional*) Provides a base URI reference with which applications can resolve relative URI references into absolute URI references. Value conforms to [data.URI](#).

<chordMember> → att.common → att.basic → @xml:base

**@xml:id** (*optional*) Regularizes the naming of an element and thus facilitates building links between it and other resources. Each id attribute within a document must have a unique value. Value is a valid [xml:id](#).

<chordMember> → att.common → att.basic → att.id → @xml:id

## Member of

(chordMember isn't member of any model class)

## Contained By

**<chordDef>** Chord tablature definition.

<chordMember> → elements having chordMember as direct children → <chordDef>

**May Contain**

– (<chordMember> may not have child elements)

**Remarks**

The string, fret, and fing attributes are provided in order to create displayable chord tablature grids. The inth (harmonic interval) attribute may be used to facilitate automated performance of a chord. It gives the number of 1/2 steps above the bass. Of course, for the bass note itself, inth should be set to 0.

**Declaration**

```
<elementSpec ident="chordMember" module="MEI.harmony">
  <desc xml:lang="en">An individual pitch in a chord defined by a
    <gi scheme="MEI">chordDef</gi>
  element.</desc>

## <chordTable>

Chord/tablature look-up table.

### Referenced in chapters

[10.2.1.1 Interpreted Chord Data in scoreDef](#)

### Module

[MEI.harmony](#)

### Attributes

**@class** (*optional*) Contains one or more URIs which denote classification terms that apply to the entity bearing this attribute. One or more values from [data.URI](#), separated by spaces.

<chordTable> → att.common → att.typed → att.classest → @class

**@copyof** (*optional*) Points to an element of which the current element is a copy. Value conforms to [data.URI](#).

<chordTable> → att.common → att.linking → @copyof

**@corresp** (*optional*) Used to point to other elements that correspond to this one in a generic fashion. One or more values from [data.URI](#), separated by spaces.

<chordTable> → att.common → att.linking → @corresp

**@follows** (*optional*) points to one or more events in a user-defined collection that are known to be predecessors of the current element. One or more values from [data.URI](#), separated by spaces.

<chordTable> → att.common → att.linking → @follows

**@label** (*optional*) Captures text to be used to generate a label for the element to which it's attached, a "tool tip" or prefatory text, for example. Should not be used to record document content. Value is plain text.

<chordTable> → att.common → att.labelled → @label

**@n** (*optional*) Provides a number-like designation that indicates an element's position in a sequence of similar elements. May not contain space characters. Value conforms to [data.WORD](#).

<chordTable> → att.common → att.nNumberLike → @n

**@next** (*optional*) Used to point to the next event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<chordTable> → att.common → att.linking → @next

**@precedes** (*optional*) Points to one or more events in a user-defined collection that are known to be successors of the current element. One or more values from [data.URI](#), separated by spaces.

<chordTable> → att.common → att.linking → @precedes

**@prev** (*optional*) Points to the previous event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<chordTable> → att.common → att.linking → @prev

**@resp** (*optional*) Indicates the agent(s) responsible for some aspect of the text's transcription, editing, or encoding. Its value must point to one or more identifiers declared in the document header. One or more values from [data.URI](#), separated by spaces.

<chordTable> → att.common → att.responsibility → @resp

**@sameas** (*optional*) Points to an element that is the same as the current element but is not a literal copy of the current element. One or more values from [data.URI](#), separated by spaces.

<chordTable> → att.common → att.linking → @sameas

**@synch** (*optional*) Points to elements that are synchronous with the current element. One or more values from [data.URI](#), separated by spaces.

<chordTable> → att.common → att.linking → @synch

**@type** (*optional*) Designation which characterizes the element in some sense, using any convenient classification scheme or typology that employs single-token labels. One or more values of datatype **NMTOKEN**, separated by spaces.

<chordTable> → att.common → att.typed → @type

**@xml:base** (*optional*) Provides a base URI reference with which applications can resolve relative URI references into absolute URI references. Value conforms to [data.URI](#).

<chordTable> → att.common → att.basic → @xml:base

**@xml:id** (*optional*) Regularizes the naming of an element and thus facilitates building links between it and other resources. Each id attribute within a document must have a unique value. Value is a valid [xml:id](#).

<chordTable> → att.common → att.basic → att.id → @xml:id

## Member of

[model.chordTableLike](#) Groups elements that group playable chord definitions.

## Contained By

**<scoreDef>** Container for score meta-information.

<chordTable> → [model.chordTableLike](#) → <scoreDef>

## May Contain

**<chordDef>** Chord tablature definition.

<chordTable> → direct children → <chordDef>

## Remarks

A chordTable may be shared between MEI instances through the use of an external parsed entity containing the look-up table to be shared.

## Declaration

```

DEVELOPMENT  
VERSION

## <classDecls>

Groups information which describes the nature or topic of an entity.

### Referenced in chapters

[3.4.2 Encoding Description](#), [3.4.2.5 Class Declarations](#), [3.6.12 Classification](#)

### Module

[MEI.header](#)

### Attributes

**@analog** (*optional*) Contains a reference to a field or element in another descriptive encoding system to which this MEI element is comparable. Value is plain text.

<classDecls> → [att.bibl](#) → @analog

**@class** (*optional*) Contains one or more URIs which denote classification terms that apply to the entity bearing this attribute. One or more values from [data.URI](#), separated by spaces.

<classDecls> → [att.common](#) → [att.typed](#) → [att.classed](#) → @class

**@copyof** (*optional*) Points to an element of which the current element is a copy. Value conforms to [data.URI](#).

<classDecls> → [att.common](#) → [att.linking](#) → @copyof

**@corresp** (*optional*) Used to point to other elements that correspond to this one in a generic fashion. One or more values from [data.URI](#), separated by spaces.

<classDecls> → [att.common](#) → [att.linking](#) → @corresp

**@follows** (*optional*) points to one or more events in a user-defined collection that are known to be predecessors of the current element. One or more values from [data.URI](#), separated by spaces.

<classDecls> → [att.common](#) → [att.linking](#) → @follows

**@label** (*optional*) Captures text to be used to generate a label for the element to which it's attached, a "tool tip" or prefatory text, for example. Should not be used to record document content. Value is plain text.

<classDecls> → [att.common](#) → [att.labelled](#) → @label

**@n** (*optional*) Provides a number-like designation that indicates an element's position in a sequence of similar elements. May not contain space characters. Value conforms to [data.WORD](#).

<classDecls> → [att.common](#) → [att.nNumberLike](#) → @n

**@next** (*optional*) Used to point to the next event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<classDecls> → [att.common](#) → [att.linking](#) → @next

**@precedes** (*optional*) Points to one or more events in a user-defined collection that are known to be successors of the current element. One or more values from [data.URI](#), separated by spaces.

<classDecls> → [att.common](#) → [att.linking](#) → @precedes

**@prev** (*optional*) Points to the previous event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<classDecls> → [att.common](#) → [att.linking](#) → @prev

**@resp** (*optional*) Indicates the agent(s) responsible for some aspect of the text's transcription, editing, or encoding. Its value must point to one or more identifiers declared in the document header. One or more values from [data.URI](#), separated by spaces.

<classDecls> → [att.common](#) → [att.responsibility](#) → @resp

**@sameas** (*optional*) Points to an element that is the same as the current element but is not a literal copy of the current element. One or more values from [data.URI](#), separated by spaces.

<classDecls> → [att.common](#) → [att.linked](#) → @sameas

**@synch** (*optional*) Points to elements that are synchronous with the current element. One or more values from [data.URI](#), separated by spaces.

<classDecls> → [att.common](#) → [att.linked](#) → @synch

**@type** (*optional*) Designation which characterizes the element in some sense, using any convenient classification scheme or typology that employs single-token labels. One or more values of datatype **NMTOKEN**, separated by spaces.

<classDecls> → [att.common](#) → [att.typed](#) → @type

**@xml:base** (*optional*) Provides a base URI reference with which applications can resolve relative URI references into absolute URI references. Value conforms to [data.URI](#).

<classDecls> → [att.common](#) → [att.basic](#) → @xml:base

**@xml:id** (*optional*) Regularizes the naming of an element and thus facilitates building links between it and other resources. Each id attribute within a document must have a unique value. Value is a valid [xml:id](#).

<classDecls> → [att.common](#) → [att.basic](#) → [att.id](#) → @xml:id

## Member of

(classDecls isn't member of any model class)

## Contained By

**<encodingDesc>** Documents the relationship between an electronic file and the source or sources from which it was derived as well as applications used in the encoding/editing process.

<classDecls> → elements having classDecls as direct children → <encodingDesc>

## May Contain

**<head>** Contains any heading, for example, the title of a section of text, or the heading of a list.

<classDecls> → [model.headLike](#) → <head>

**<taxonomy>** Defines a typology either implicitly, by means of a bibliographic citation, or explicitly by a structured taxonomy.

<classDecls> → direct children → <taxonomy>

## Remarks

Although the use of names and terms from locally controlled vocabularies is possible, best practice suggests that terms should come from standard national or international vocabularies whenever they are available in order to enable searches in systems that include multiple MEI documents, or MEI documents and bibliographic records from many institutions.

## Declaration

```
<elementSpec ident="classDecls" module="MEI.header">

```

## <classification>

Groups information which describes the nature or topic of an entity.

### Referenced in chapters

[3.4.2.5 Class Declarations](#), [3.6 Work Description](#), [3.6.12 Classification](#), [3.7 Encoding Sources in MEI](#), [3.8.3 Minimal and Recommended Header Information](#)

### Module

[MEI.header](#)

### Attributes

**@analog** (*optional*) Contains a reference to a field or element in another descriptive encoding system to which this MEI element is comparable. Value is plain text.

<classification> → [att.bibl](#) → @analog

**@class** (*optional*) Contains one or more URIs which denote classification terms that apply to the entity bearing this attribute. One or more values from [data.URI](#), separated by spaces.

<classification> → [att.common](#) → [att.typed](#) → [att.classed](#) → @class

**@copyof** (*optional*) Points to an element of which the current element is a copy. Value conforms to [data.URI](#).

<classification> → [att.common](#) → [att.linking](#) → @copyof

**@corresp** (*optional*) Used to point to other elements that correspond to this one in a generic fashion. One or more values from [data.URI](#), separated by spaces.

<classification> → [att.common](#) → [att.linking](#) → @corresp

**@data** (*optional*) Used to link metadata elements to one or more data-containing elements. One or more values from [data.URI](#), separated by spaces.

<classification> → [att.dataPointing](#) → @data

**@follows** (*optional*) points to one or more events in a user-defined collection that are known to be predecessors of the current element. One or more values from [data.URI](#), separated by spaces.

<classification> → [att.common](#) → [att.linking](#) → @follows

**@label** (*optional*) Captures text to be used to generate a label for the element to which it's attached, a "tool tip" or prefatory text, for example. Should not be used to record document content. Value is plain text.

<classification> → [att.common](#) → [att.labelled](#) → @label

**@n** (*optional*) Provides a number-like designation that indicates an element's position in a sequence of similar elements. May not contain space characters. Value conforms to [data.WORD](#).

<classification> → [att.common](#) → [att.nNumberLike](#) → @n

**@next** (*optional*) Used to point to the next event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<classification> → [att.common](#) → [att.linking](#) → @next

**@precedes** (*optional*) Points to one or more events in a user-defined collection that are known to be successors of the current element. One or more values from [data.URI](#), separated by spaces.

<classification> → [att.common](#) → [att.linking](#) → @precedes

**@prev** (*optional*) Points to the previous event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<classification> → [att.common](#) → [att.linking](#) → @prev

**@resp** (*optional*) Indicates the agent(s) responsible for some aspect of the text's transcription, editing, or encoding. Its value must point to one or more identifiers declared in the document header. One or more values from [data.URI](#), separated by spaces.

<classification> → [att.common](#) → [att.responsibility](#) → @resp

**@sameas** (*optional*) Points to an element that is the same as the current element but is not a literal copy of the current element. One or more values from [data.URI](#), separated by spaces.

<classification> → [att.common](#) → [att.linking](#) → @sameas

**@synch** (*optional*) Points to elements that are synchronous with the current element. One or more values from [data.URI](#), separated by spaces.

<classification> → [att.common](#) → [att.linking](#) → @synch

**@type** (*optional*) Designation which characterizes the element in some sense, using any convenient classification scheme or typology that employs single-token labels. One or more values of datatype **NMTOKEN**, separated by spaces.

<classification> → [att.common](#) → [att.typed](#) → @type

**@xml:base** (*optional*) Provides a base URI reference with which applications can resolve relative URI references into absolute URI references. Value conforms to [data.URI](#).

<classification> → [att.common](#) → [att.basic](#) → @xml:base

**@xml:id** (*optional*) Regularizes the naming of an element and thus facilitates building links between it and other resources. Each id attribute within a document must have a unique value. Value is a valid [xml:id](#).

<classification> → [att.common](#) → [att.basic](#) → [att.id](#) → @xml:id

## Member of

(classification isn't member of any model class)

## Contained By

**<expression>** Intellectual or artistic realization of a work.

<classification> → elements having classification as direct children → <expression>

**<item>** Single instance or exemplar of a source/manifestation.

<classification> → elements having classification as direct children → <item>

**<manifestation>** A bibliographic description of a physical embodiment of an expression of a work.

<classification> → elements having classification as direct children → <manifestation>

**<work>** Provides a detailed description of a work — a distinct intellectual or artistic creation — specifically its history, language use, and high-level musical attributes (e.g., key, tempo, meter, medium of performance, and intended duration).

<classification> → elements having classification as direct children → <work>

## May Contain

**<head>** Contains any heading, for example, the title of a section of text, or the heading of a list.

<classification> → [model.headLike](#) → <head>

**<termList>** Collection of text phrases which describe a resource.

<classification> → direct children → <termList>

## Remarks

Although the use of names and terms from locally controlled vocabularies is possible, best practice suggests that terms should come from standard national or international vocabularies whenever they are available in order to enable searches in systems that include multiple MEI documents, or MEI documents and bibliographic records from many institutions.

## Declaration

```
<elementSpec ident="classification" module="MEI.header">

  </remarks>
</elementSpec>
```

## <clef>

Indication of the exact location of a particular note on the staff and, therefore, the other notes as well.

### Referenced in chapters

[2.2.1 Score and Parts](#), [2.2.4 Other events](#), [2.2.4.1 Key Signatures and Clefs](#), [2.4.3.3 Positioning](#), [3.6.2 Incipits](#), [4.2.2 Defining Score Parameters for CMN](#), [4.2.3 Special cases in staff definitions](#)

### Module

[MEI.shared](#)

### Attributes

**@altsym** (*optional*) Provides a way of pointing to a user-defined symbol. It must contain a reference to an ID of a [<symbolDef>](#) element elsewhere in the document. Value conforms to [data.URI](#).

<clef> → [att.clef.vis](#) → [att.altSym](#) → @altsym

**@cautionary** (*optional*) Records the function of the clef. A "cautionary" clef does not change the following pitches. Value conforms to [data.BOOLEAN](#).

<clef> → [att.clef.log](#) → @cautionary

**@class** (*optional*) Contains one or more URIs which denote classification terms that apply to the entity bearing this attribute. One or more values from [data.URI](#), separated by spaces.

<clef> → [att.common](#) → [att.typed](#) → [att.classed](#) → @class

**@color** (*optional*) Used to indicate visual appearance. Do not confuse this with the musical term 'color' as used in pre-CMN notation. Value conforms to [data.COLOR](#).

<clef> → [att.clef.vis](#) → [att.color](#) → @color

**@copyof** (*optional*) Points to an element of which the current element is a copy. Value conforms to [data.URI](#).

<clef> → [att.common](#) → [att.linkin](#) → @copyof

**@corresp** (*optional*) Used to point to other elements that correspond to this one in a generic fashion. One or more values from [data.URI](#), separated by spaces.

<clef> → [att.common](#) → [att.linkin](#) → @corresp

**@dis** (*optional*) Records the amount of octave displacement. Value conforms to [data.OCTAVE.DIS](#).

<clef> → [att.clef.log](#) → [att.octaveDisplacement](#) → @dis

**@dis.place** (*optional*) Records the direction of octave displacement. Value conforms to [data.STAFFREL.basic](#).

<clef> → [att.clef.log](#) → [att.octaveDisplacement](#) → @dis.place

**@enclose** (*optional*) Records the characters often used to mark accidentals, articulations, and sometimes notes as having a cautionary or editorial function. For an example of cautionary accidentals enclosed in parentheses, see Read, p. 131, ex. 9-14. Value conforms to [data.ENCLOSURE](#).

<clef> → [att.clef.vis](#) → [att.enclosingChars](#) → @enclose

**@facs** (*optional*) Points to one or more images, portions of an image, or surfaces which correspond to the current element. One or more values from [data.URI](#), separated by spaces.

<clef> → [att.facsimile](#) → @facs

**@follows** (*optional*) points to one or more events in a user-defined collection that are known to be predecessors of the current element. One or more values from [data.URI](#), separated by spaces.

<clef> → [att.common](#) → [att.linking](#) → @follows

**@fontfam** (*optional*) Contains the name of a font-family. Value conforms to [data.FONTFAMILY](#).

<clef> → [att.clef.vis](#) → [att.typography](#) → @fontfam

**@fontname** (*optional*) Holds the name of a font. Value conforms to [data.FONTNAME](#).

<clef> → [att.clef.vis](#) → [att.typography](#) → @fontname

**@fontsize** (*optional*) Indicates the size of a font expressed in printers' points, i.e., 1/72nd of an inch, relative terms, e.g., small, larger, etc., or percentage values relative to normal size, e.g., 125%. Value conforms to [data.FONTSIZE](#).

<clef> → [att.clef.vis](#) → [att.typography](#) → @fontsize

**@fontstyle** (*optional*) Records the style of a font, i.e., italic, oblique, or normal. Value conforms to [data.FONTSTYLE](#).

<clef> → [att.clef.vis](#) → [att.typography](#) → @fontstyle

**@fontweight** (*optional*) Used to indicate bold type. Value conforms to [data.FONTWEIGHT](#).

<clef> → [att.clef.vis](#) → [att.typography](#) → @fontweight

**@glyph.auth** (*optional*) A name or label associated with the controlled vocabulary from which the value of `glyph.name` or `glyph.num` is taken, or the textual content of the element. Allowed values are: "**smufl**" (*Standard Music Font Layout*.)

<clef> → [att.clef.vis](#) → [att.extSym](#) → [att.extSym.auth](#) → @glyph.auth

**@glyph.name** (*optional*) Glyph name. Value is plain text.

<clef> → [att.clef.vis](#) → [att.extSym](#) → [att.extSym.names](#) → @glyph.name

**@glyph.num** (*optional*) Numeric glyph reference in hexadecimal notation, e.g., "#xE000" or "U+E000". N.B. SMuFL version 1.18 uses the range U+E000 - U+ECBF. Value conforms to [data.HEXNUM](#).

<clef> → [att.clef.vis](#) → [att.extSym](#) → [att.extSym.names](#) → @glyph.num

**@glyph.uri** (*optional*) The web-accessible location of the controlled vocabulary from which the value of `glyph.name` or `glyph.num` is taken, or the textual content of the element. Value conforms to [data.URI](#).

<clef> → [att.clef.vis](#) → [att.extSym](#) → [att.extSym.auth](#) → @glyph.uri

**@ho** (*optional*) Records a horizontal adjustment to a feature's programmatically-determined location in terms of staff interline distance; that is, in units of 1/2 the distance between adjacent staff lines. Value conforms to [data.MEASUREMENTSIGNED](#).

<clef> → [att.clef.vis](#) → [att.visualOffset](#) → [att.visualOffset.ho](#) → @ho

**@label** (*optional*) Captures text to be used to generate a label for the element to which it's attached, a "tool tip" or prefatory text, for example. Should not be used to record document content. Value is plain text.

<clef> → [att.common](#) → [att.labelled](#) → @label

**@layer** (*optional*) Identifies the layer to which a feature applies. One or more values of datatype **positiveInteger**, separated by spaces.

<clef> → [att.event](#) → [att.layerIdent](#) → @layer

**@letterspacing** (*optional*) Indicates letter spacing (aka tracking) in analogy to the CSS letter-spacing property. Value conforms to [data.MEASUREMENTTYPOGRAPHYSIGNED](#).

<clef> → [att.clef.vis](#) → [att.typography](#) → @letterspacing

**@line** (*optional*) Indicates the line upon which a feature stands. The value must be in the range between 1 and the number of lines on the staff. The numbering of lines starts with the lowest line of the staff. Value conforms to [data.CLEFLINE](#).

<clef> → att.clef.log → att.lineLoc → @line

**@lineheight** (*optional*) Indicates line height in analogy to the CSS line-height property. Value conforms to either [data.MEASUREMENTTYPOGRAPHYUNSIGNED](#) or [data.PERCENT](#).

<clef> → att.clef.vis → att.typography → @lineheight

**@n** (*optional*) Provides a number-like designation that indicates an element's position in a sequence of similar elements. May not contain space characters. Value conforms to [data.WORD](#).

<clef> → att.common → att.nNumberLike → @n

**@next** (*optional*) Used to point to the next event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<clef> → att.common → att.linking → @next

**@oct** (*optional*) Captures written octave information. Value conforms to [data.OCTAVE](#).

<clef> → att.clef.log → att.octave → @oct

**@precedes** (*optional*) Points to one or more events in a user-defined collection that are known to be successors of the current element. One or more values from [data.URI](#), separated by spaces.

<clef> → att.common → att.linking → @precedes

**@prev** (*optional*) Points to the previous event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<clef> → att.common → att.linking → @prev

**@resp** (*optional*) Indicates the agent(s) responsible for some aspect of the text's transcription, editing, or encoding. Its value must point to one or more identifiers declared in the document header. One or more values from [data.URI](#), separated by spaces.

<clef> → att.common → att.responsibility → @resp

**@sameas** (*optional*) Points to an element that is the same as the current element but is not a literal copy of the current element. One or more values from [data.URI](#), separated by spaces.

<clef> → att.common → att.linking → @sameas

**@shape** (*optional*) Describes a clef's shape. Value conforms to [data.CLEFSHAPE](#).

<clef> → att.clef.log → att.clefShape → @shape

**@staff** (*recommended*) Signifies the staff on which a notated event occurs or to which a control event applies. Mandatory when applicable. One or more values of datatype **positiveInteger**, separated by spaces.

<clef> → att.event → att.staffIdent → @staff

**@synch** (*optional*) Points to elements that are synchronous with the current element. One or more values from [data.URI](#), separated by spaces.

<clef> → att.common → att.linking → @synch

**@to** (*optional*) Records a timestamp adjustment of a feature's programmatically-determined location in terms of musical time; that is, beats. Value conforms to [data.TSTAMPOFFSET](#).

<clef> → att.clef.vis → att.visualOffset → att.visualOffset.to → @to

**@tstamp** (*optional*) Encodes the onset time in terms of musical time, i.e., beats[.fractional beat part], as expressed in the written time signature. Value conforms to [data.BEAT](#).

<clef> → att.event → att.timestamp.log → @tstamp

**@tstamp.ges** (*optional*) Encodes the onset time in terms of musical time, i.e., beats[.fractional beat part], as expressed in the written time signature. Value conforms to [data.BEAT](#).

<clef> → att.event → att.timestamp.ges → @tstamp.ges

**@tstamp.real** (*optional*) Records the onset time in terms of ISO time. Value conforms to [data.ISOTIME](#).

<clef> → att.event → att.timestamp.ges → @tstamp.real

**@type** (*optional*) Designation which characterizes the element in some sense, using any convenient classification scheme or typology that employs single-token labels. One or more values of datatype **NMTOKEN**, separated by spaces.

<clef> → att.common → att.typed → @type

**@visible** (*optional*) Indicates if a feature should be rendered when the notation is presented graphically or sounded when it is presented in an aural form. Value conforms to [data.BOOLEAN](#).

<clef> → att.clef.vis → att.visibility → @visible

**@vo** (*optional*) Records the vertical adjustment of a feature's programmatically-determined location in terms of staff interline distance; that is, in units of 1/2 the distance between adjacent staff lines. Value conforms to [data.MEASUREMENTSIGNED](#).

<clef> → att.clef.vis → att.visualOffset → att.visualOffset.vo → @vo

**@when** (*optional*) Indicates the point of occurrence of this feature along a time line. Its value must be the ID of a <when> element elsewhere in the document. Value conforms to [data.URI](#).

<clef> → att.event → att.alignment → @when

**@xml:base** (*optional*) Provides a base URI reference with which applications can resolve relative URI references into absolute URI references. Value conforms to [data.URI](#).

<clef> → att.common → att.basic → @xml:base

**@xml:id** (*optional*) Regularizes the naming of an element and thus facilitates building links between it and other resources. Each id attribute within a document must have a unique value. Value is a valid [xml:id](#).

<clef> → att.common → att.basic → att.id → @xml:id

## Member of

[model.eventLike](#) Groups event elements that occur in all notational repertoires.

[model.staffDefPart](#) Groups elements that may appear in the declaration of staff features.

[model.syllablePart](#) Groups elements that may appear as part of the content of a syllable.

## Contained By

**<abbr>** A generic element for 1) a shortened form of a word, including an acronym or 2) a shorthand notation.

<clef> → model.eventLike → model.layerPart → <abbr>

**<add>** Marks an addition to the text.

<clef> → model.eventLike → model.layerPart → <add>

**<beam>** A container for a series of explicitly beamed events that begins and ends entirely within a measure.

<clef> → model.eventLike → <beam>

**<clefGrp>** A set of simultaneously-occurring clefs.

<clef> → elements having clef as direct children → <clefGrp>

**<corr>** Contains the correct form of an apparent erroneous passage.

<clef> → model.eventLike → model.layerPart → <corr>

**<damage>** Contains an area of damage to the physical medium.

<clef> → model.eventLike → model.layerPart → <damage>

**<del>** Contains information deleted, marked as deleted, or otherwise indicated as superfluous or spurious in the copy text by an author, scribe, annotator, or corrector.

<clef> → model.eventLike → model.layerPart → <del>

**<expan>** Contains the expansion of an abbreviation.

<clef> → model.eventLike → model.layerPart → <expan>

**<fTrem>** A rapid alternation between a pair of notes (or chords or perhaps between a note and a chord) that are (usually) farther apart than a major second.

<clef> → elements having clef as direct children → <fTrem>

**<graceGrp>** A container for a sequence of grace notes.

<clef> → model.eventLike → <graceGrp>

**<incip>** The opening music and/or words of a musical or textual work.

<clef> → elements having clef as direct children → <incip>

**<layer>** An independent stream of events on a staff.

<clef> → model.eventLike → model.layerPart → <layer>

**<lem>** (lemma) – Contains the lemma, or base text, of a textual variation.

<clef> → model.eventLike → model.layerPart → <lem>

**<ligature>** A mensural notation symbol that combines two or more notes into a single sign.

<clef> → model.eventLike → <ligature>

**<oLayer>** A layer that contains an alternative to material in another layer.

<clef> → model.eventLike → model.layerPart → <oLayer>

**<orig>** Contains material which is marked as following the original, rather than being normalized or corrected.

<clef> → model.eventLike → model.layerPart → <orig>

**<rdg>** (reading) – Contains a single reading within a textual variation.

<clef> → model.eventLike → model.layerPart → <rdg>

**<reg>** Contains material which has been regularized or normalized in some sense.

<clef> → model.eventLike → model.layerPart → <reg>

**<restore>** Indicates restoration of material to an earlier state by cancellation of an editorial or authorial marking or instruction.

<clef> → model.eventLike → model.layerPart → <restore>

**<sic>** Contains apparently incorrect or inaccurate material.

<clef> → model.eventLike → model.layerPart → <sic>

**<staffDef>** Container for staff meta-information.

<clef> → model.staffDefPart → <staffDef>

**<supplied>** Contains material supplied by the transcriber or editor for any reason.

<clef> → model.eventLike → model.layerPart → <supplied>

**<syllable>** Neume notation can be thought of as "neumed text". Therefore, the syllable element provides high-level organization in this repertoire.

<clef> → model.syllablePart → <syllable>

**<tuplet>** A group of notes with "irregular" (sometimes called "irrational") rhythmic values, for example, three notes in the time normally occupied by two or nine in the time of five.

<clef> → model.eventLike → <tuplet>

**<unclear>** Contains material that cannot be transcribed with certainty because it is illegible or inaudible in the source.

<clef> → model.eventLike → model.layerPart → <unclear>

### May Contain

- (<clef> may not have child elements)

### Remarks

This element can be used as an alternative to the <staff> element's clef.\* attributes. It should be used when specific display info, such as size or color, needs to be recorded for the clef or when multiple, simultaneous clefs occur on a single staff. This element may also be used within the staff context to indicate changes of clef.

### Constraints

The clef position must be less than or equal to the number of lines of an ancestor staff.

The clef position must be less than or equal to the number of lines of a preceding staff.

### Declaration

### Attributes

**@class** (*optional*) Contains one or more URIs which denote classification terms that apply to the entity bearing this attribute. One or more values from [data.URI](#), separated by spaces.

<clefGrp> → [att.common](#) → [att.typed](#) → [att.classed](#) → @class

**@copyof** (*optional*) Points to an element of which the current element is a copy. Value conforms to [data.URI](#).

<clefGrp> → [att.common](#) → [att.linked](#) → @copyof

**@corresp** (*optional*) Used to point to other elements that correspond to this one in a generic fashion. One or more values from [data.URI](#), separated by spaces.

<clefGrp> → [att.common](#) → [att.linked](#) → @corresp

**@facs** (*optional*) Points to one or more images, portions of an image, or surfaces which correspond to the current element. One or more values from [data.URI](#), separated by spaces.

<clefGrp> → [att.facsimile](#) → @facs

**@follows** (*optional*) points to one or more events in a user-defined collection that are known to be predecessors of the current element. One or more values from [data.URI](#), separated by spaces.

<clefGrp> → [att.common](#) → [att.linked](#) → @follows

**@label** (*optional*) Captures text to be used to generate a label for the element to which it's attached, a "tool tip" or prefatory text, for example. Should not be used to record document content. Value is plain text.

<clefGrp> → [att.common](#) → [att.labelled](#) → @label

**@layer** (*optional*) Identifies the layer to which a feature applies. One or more values of datatype **positiveInteger**, separated by spaces.

<clefGrp> → [att.event](#) → [att.layerIdent](#) → @layer

**@n** (*optional*) Provides a number-like designation that indicates an element's position in a sequence of similar elements. May not contain space characters. Value conforms to [data.WORD](#).

<clefGrp> → [att.common](#) → [att.nNumberLike](#) → @n

**@next** (*optional*) Used to point to the next event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<clefGrp> → [att.common](#) → [att.linked](#) → @next

**@precedes** (*optional*) Points to one or more events in a user-defined collection that are known to be successors of the current element. One or more values from [data.URI](#), separated by spaces.

<clefGrp> → [att.common](#) → [att.linked](#) → @precedes

**@prev** (*optional*) Points to the previous event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<clefGrp> → att.common → att.linking → @prev

**@resp** (*optional*) Indicates the agent(s) responsible for some aspect of the text's transcription, editing, or encoding. Its value must point to one or more identifiers declared in the document header. One or more values from [data.URI](#), separated by spaces.

<clefGrp> → att.common → att.responsibility → @resp

**@sameas** (*optional*) Points to an element that is the same as the current element but is not a literal copy of the current element. One or more values from [data.URI](#), separated by spaces.

<clefGrp> → att.common → att.linking → @sameas

**@staff** (*recommended*) Signifies the staff on which a notated event occurs or to which a control event applies. Mandatory when applicable. One or more values of datatype **positiveInteger**, separated by spaces.

<clefGrp> → att.event → att.staffId → @staff

**@synch** (*optional*) Points to elements that are synchronous with the current element. One or more values from [data.URI](#), separated by spaces.

<clefGrp> → att.common → att.linking → @synch

**@tstamp** (*optional*) Encodes the onset time in terms of musical time, i.e., beats[.fractional beat part], as expressed in the written time signature. Value conforms to [data.BEAT](#).

<clefGrp> → att.event → att.timestamp.log → @tstamp

**@tstamp.ges** (*optional*) Encodes the onset time in terms of musical time, i.e., beats[.fractional beat part], as expressed in the written time signature. Value conforms to [data.BEAT](#).

<clefGrp> → att.event → att.timestamp.ges → @tstamp.ges

**@tstamp.real** (*optional*) Records the onset time in terms of ISO time. Value conforms to [data.ISOTIME](#).

<clefGrp> → att.event → att.timestamp.ges → @tstamp.real

**@type** (*optional*) Designation which characterizes the element in some sense, using any convenient classification scheme or typology that employs single-token labels. One or more values of datatype **NMTOKEN**, separated by spaces.

<clefGrp> → att.common → att.typed → @type

**@when** (*optional*) Indicates the point of occurrence of this feature along a time line. Its value must be the ID of a <when> element elsewhere in the document. Value conforms to [data.URI](#).

<clefGrp> → att.event → att.alignment → @when

**@xml:base** (*optional*) Provides a base URI reference with which applications can resolve relative URI references into absolute URI references. Value conforms to [data.URI](#).

<clefGrp> → att.common → att.basic → @xml:base

**@xml:id** (*optional*) Regularizes the naming of an element and thus facilitates building links between it and other resources. Each id attribute within a document must have a unique value. Value is a valid [xml:id](#).

<clefGrp> → att.common → att.basic → att.id → @xml:id

## Member of

[model.eventLike](#) Groups event elements that occur in all notational repertoires.

[model.staffDefPart](#) Groups elements that may appear in the declaration of staff features.

**Contained By**

**<abbr>** A generic element for 1) a shortened form of a word, including an acronym or 2) a shorthand notation.

<clefGrp> → model.eventLike → model.layerPart → <abbr>

**<add>** Marks an addition to the text.

<clefGrp> → model.eventLike → model.layerPart → <add>

**<beam>** A container for a series of explicitly beamed events that begins and ends entirely within a measure.

<clefGrp> → model.eventLike → <beam>

**<corr>** Contains the correct form of an apparent erroneous passage.

<clefGrp> → model.eventLike → model.layerPart → <corr>

**<damage>** Contains an area of damage to the physical medium.

<clefGrp> → model.eventLike → model.layerPart → <damage>

**<del>** Contains information deleted, marked as deleted, or otherwise indicated as superfluous or spurious in the copy text by an author, scribe, annotator, or corrector.

<clefGrp> → model.eventLike → model.layerPart → <del>

**<expan>** Contains the expansion of an abbreviation.

<clefGrp> → model.eventLike → model.layerPart → <expan>

**<graceGrp>** A container for a sequence of grace notes.

<clefGrp> → model.eventLike → <graceGrp>

**<incip>** The opening music and/or words of a musical or textual work.

<clefGrp> → elements having clefGrp as direct children → <incip>

**<layer>** An independent stream of events on a staff.

<clefGrp> → model.eventLike → model.layerPart → <layer>

**<lem>** (lemma) – Contains the lemma, or base text, of a textual variation.

<clefGrp> → model.eventLike → model.layerPart → <lem>

**<ligature>** A mensural notation symbol that combines two or more notes into a single sign.

<clefGrp> → model.eventLike → <ligature>

**<oLayer>** A layer that contains an alternative to material in another layer.

<clefGrp> → model.eventLike → model.layerPart → <oLayer>

**<orig>** Contains material which is marked as following the original, rather than being normalized or corrected.

<clefGrp> → model.eventLike → model.layerPart → <orig>

**<rdg>** (reading) – Contains a single reading within a textual variation.

<clefGrp> → model.eventLike → model.layerPart → <rdg>

**<reg>** Contains material which has been regularized or normalized in some sense.

<clefGrp> → model.eventLike → model.layerPart → <reg>

**<restore>** Indicates restoration of material to an earlier state by cancellation of an editorial or authorial marking or instruction.

<clefGrp> → model.eventLike → model.layerPart → <restore>

**<sic>** Contains apparently incorrect or inaccurate material.

<clefGrp> → model.eventLike → model.layerPart → <sic>

**<staffDef>** Container for staff meta-information.

<clefGrp> → model.staffDefPart → <staffDef>

**<supplied>** Contains material supplied by the transcriber or editor for any reason.

<clefGrp> → model.eventLike → model.layerPart → <supplied>

**<tuplet>** A group of notes with "irregular" (sometimes called "irrational") rhythmic values, for example, three notes in the time normally occupied by two or nine in the time of five.

<clefGrp> → model.eventLike → <tuplet>

**<unclear>** Contains material that cannot be transcribed with certainty because it is illegible or inaudible in the source.

<clefGrp> → model.eventLike → model.layerPart → <unclear>

## May Contain

**<clef>** Indication of the exact location of a particular note on the staff and, therefore, the other notes as well.

<clefGrp> → direct children → <clef>

## <clip>

Defines a time segment of interest within a recording or within a digital audio or video file.

### Referenced in chapters

[12.2.1 Overview](#)

### Module

[MEI.performance](#)

### Attributes

**@begin** (*optional*) Specifies a point where the relevant content begins. A numerical value must be less and a time value must be earlier than that given by the end attribute. Value is plain text.

<clip> → [att.mediaBounds](#) → @begin

**@betype** (*optional*) Type of values used in the begin/end attributes. The begin and end attributes can only be interpreted meaningfully in conjunction with this attribute. Value conforms to [data.BETYPE](#).

<clip> → [att.mediaBounds](#) → @betype

**@class** (*optional*) Contains one or more URIs which denote classification terms that apply to the entity bearing this attribute. One or more values from [data.URI](#), separated by spaces.

<clip> → [att.common](#) → [att.typed](#) → [att.classed](#) → @class

**@copyof** (*optional*) Points to an element of which the current element is a copy. Value conforms to [data.URI](#).

<clip> → [att.common](#) → [att.linkin](#) → @copyof

**@corresp** (*optional*) Used to point to other elements that correspond to this one in a generic fashion. One or more values from [data.URI](#), separated by spaces.

<clip> → [att.common](#) → [att.linkin](#) → @corresp

**@data** (*optional*) Used to link metadata elements to one or more data-containing elements. One or more values from [data.URI](#), separated by spaces.

<clip> → [att.dataPointing](#) → @data

**@decls** (*optional*) Identifies one or more metadata elements (other than classification terms) within the header, which are understood to apply to the element bearing this attribute and its content. One or more values from [data.URI](#), separated by spaces.

<clip> → [att.metadataPointing](#) → @decls

**@end** (*optional*) Specifies a point where the relevant content ends. If not specified, the end of the content is assumed to be the end point. A numerical value must be greater and a time value must be later than that given by the begin attribute. Value is plain text.

<clip> → [att.mediaBounds](#) → @end

**@follows** (*optional*) points to one or more events in a user-defined collection that are known to be predecessors of the current element. One or more values from [data.URI](#), separated by spaces.

<clip> → [att.common](#) → [att.linkin](#) → @follows

**@label** (*optional*) Captures text to be used to generate a label for the element to which it's attached, a "tool tip" or prefatory text, for example. Should not be used to record document content. Value is plain text.

<clip> → att.common → att.labelled → @label

**@n (optional)** Provides a number-like designation that indicates an element's position in a sequence of similar elements. May not contain space characters. Value conforms to [data.WORD](#).

<clip> → att.common → att.nNumberLike → @n

**@next (optional)** Used to point to the next event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<clip> → att.common → att.linked → @next

**@precedes (optional)** Points to one or more events in a user-defined collection that are known to be successors of the current element. One or more values from [data.URI](#), separated by spaces.

<clip> → att.common → att.linked → @precedes

**@prev (optional)** Points to the previous event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<clip> → att.common → att.linked → @prev

**@resp (optional)** Indicates the agent(s) responsible for some aspect of the text's transcription, editing, or encoding. Its value must point to one or more identifiers declared in the document header. One or more values from [data.URI](#), separated by spaces.

<clip> → att.common → att.responsibility → @resp

**@sameas (optional)** Points to an element that is the same as the current element but is not a literal copy of the current element. One or more values from [data.URI](#), separated by spaces.

<clip> → att.common → att.linked → @sameas

**@startid (optional)** Holds a reference to the first element in a sequence of events to which the feature applies. Value conforms to [data.URI](#).

<clip> → att.startId → @startid

**@synch (optional)** Points to elements that are synchronous with the current element. One or more values from [data.URI](#), separated by spaces.

<clip> → att.common → att.linked → @synch

**@type (optional)** Designation which characterizes the element in some sense, using any convenient classification scheme or typology that employs single-token labels. One or more values of datatype **NMTOKEN**, separated by spaces.

<clip> → att.common → att.typed → @type

**@xml:base (optional)** Provides a base URI reference with which applications can resolve relative URI references into absolute URI references. Value conforms to [data.URI](#).

<clip> → att.common → att.basic → @xml:base

**@xml:id (optional)** Regularizes the naming of an element and thus facilitates building links between it and other resources. Each id attribute within a document must have a unique value. Value is a valid [xml:id](#).

<clip> → att.common → att.basic → att.id → @xml:id

## Member of

(clip isn't member of any model class)

## Contained By

**<avFile>** References an external digital audio or video file.

<clip> → elements having clip as direct children → <avFile>

**<recording>** A recorded performance.

<clip> → elements having clip as direct children → <recording>

## May Contain

**<avFile>** References an external digital audio or video file.

<clip> → direct children → <avFile>

**<when>** Indicates a point in time either absolutely (using the absolute attribute), or relative to another when element (using the since, interval and inttype attributes).

<clip> → direct children → <when>

## Remarks

This element is analogous to the **<zone>** element in the facsimile module.

## Constraints

When @begin or @end is used, @betype should appear on clip or one of its ancestors.

## Declaration

```
<elementSpec ident="clip" module="MEI.performance">
  <desc xml:lang="en">Defines a time segment of interest within a recording or within a
  digital audio or video file.</desc>

## <colLayout>

(column layout) – An empty formatting element that signals the start of columnar layout.

### Referenced in chapters

[2.1.3 Document Layout Elements](#)

### Module

[MEI.shared](#)

### Attributes

**@class** (*optional*) Contains one or more URIs which denote classification terms that apply to the entity bearing this attribute. One or more values from [data.URI](#), separated by spaces.

<colLayout> → att.common → att.typed → att.classest → @class

**@cols** (*required*) Records the number of columns. Value is a positive integer.

<colLayout> → direct children → @cols

**@copyof** (*optional*) Points to an element of which the current element is a copy. Value conforms to [data.URI](#).

<colLayout> → att.common → att.linking → @copyof

**@corresp** (*optional*) Used to point to other elements that correspond to this one in a generic fashion. One or more values from [data.URI](#), separated by spaces.

<colLayout> → att.common → att.linking → @corresp

**@follows** (*optional*) points to one or more events in a user-defined collection that are known to be predecessors of the current element. One or more values from [data.URI](#), separated by spaces.

<colLayout> → att.common → att.linking → @follows

**@label** (*optional*) Captures text to be used to generate a label for the element to which it's attached, a "tool tip" or prefatory text, for example. Should not be used to record document content. Value is plain text.

<colLayout> → att.common → att.labelled → @label

**@n** (*optional*) Provides a number-like designation that indicates an element's position in a sequence of similar elements. May not contain space characters. Value conforms to [data.WORD](#).

<colLayout> → att.common → att.nNumberLike → @n

**@next** (*optional*) Used to point to the next event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<colLayout> → att.common → att.linking → @next

**@precedes** (*optional*) Points to one or more events in a user-defined collection that are known to be successors of the current element. One or more values from [data.URI](#), separated by spaces.

<colLayout> → att.common → att.linking → @precedes

**@prev** (*optional*) Points to the previous event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<colLayout> → att.common → att.linking → @prev

**@resp** (*optional*) Indicates the agent(s) responsible for some aspect of the text's transcription, editing, or encoding. Its value must point to one or more identifiers declared in the document header. One or more values from [data.URI](#), separated by spaces.

<colLayout> → att.common → att.responsibility → @resp

**@sameas** (*optional*) Points to an element that is the same as the current element but is not a literal copy of the current element. One or more values from [data.URI](#), separated by spaces.

<colLayout> → att.common → att.linking → @sameas

**@source** (*optional*) Contains a list of one or more pointers indicating the sources which attest to a given reading. Each value should correspond to the ID of a <source> or <manifestation> element located in the document header. One or more values from [data.URI](#), separated by spaces.

<colLayout> → att.source → @source

**@synch** (*optional*) Points to elements that are synchronous with the current element. One or more values from [data.URI](#), separated by spaces.

<colLayout> → att.common → att.linking → @synch

**@type** (*optional*) Designation which characterizes the element in some sense, using any convenient classification scheme or typology that employs single-token labels. One or more values of datatype **NMTOKEN**, separated by spaces.

<colLayout> → att.common → att.typed → @type

**@xml:base** (*optional*) Provides a base URI reference with which applications can resolve relative URI references into absolute URI references. Value conforms to [data.URI](#).

<colLayout> → att.common → att.basic → @xml:base

**@xml:id** (*optional*) Regularizes the naming of an element and thus facilitates building links between it and other resources. Each id attribute within a document must have a unique value. Value is a valid [xml:id](#).

<colLayout> → att.common → att.basic → att.id → @xml:id

## Member of

[model.milestoneLike.music](#) Groups milestone-style elements found in music notation.

[model.milestoneLike.text](#) Groups milestone-style elements found in text.

## Contained By

**<abbr>** A generic element for 1) a shortened form of a word, including an acronym or 2) a shorthand notation.

<colLayout> → [model.milestoneLike.music](#) → <abbr>

**<add>** Marks an addition to the text.

<colLayout> → [model.milestoneLike.music](#) → <add>

**<argument>** Contains a formal list or prose description of topics addressed.

<colLayout> → [model.milestoneLike.text](#) → <argument>

**<back>** Contains any appendixes, advertisements, indexes, etc. following the main body of a musical text.

<colLayout> → [model.milestoneLike.text](#) → <back>

**<corr>** Contains the correct form of an apparent erroneous passage.

<colLayout> → [model.milestoneLike.music](#) → <corr>

**<damage>** Contains an area of damage to the physical medium.

<colLayout> → model.milestoneLike.music → <damage>

**<del>** Contains information deleted, marked as deleted, or otherwise indicated as superfluous or spurious in the copy text by an author, scribe, annotator, or corrector.

<colLayout> → model.milestoneLike.music → <del>

**<div>** Major structural division of text, such as a preface, chapter or section.

<colLayout> → model.milestoneLike.text → <div>

**<ending>** Alternative ending for a repeated passage of music; i.e., prima volta, seconda volta, etc.

<colLayout> → model.milestoneLike.music → <ending>

**<expan>** Contains the expansion of an abbreviation.

<colLayout> → model.milestoneLike.music → <expan>

**<front>** Bundles prefatory text found before the start of the musical text.

<colLayout> → model.milestoneLike.text → <front>

**<layer>** An independent stream of events on a staff.

<colLayout> → model.milestoneLike.music → <layer>

**<lem>** (lemma) – Contains the lemma, or base text, of a textual variation.

<colLayout> → model.milestoneLike.music → <lem>

**<measure>** Unit of musical time consisting of a fixed number of note values of a given type, as determined by the prevailing meter, and delimited in musical notation by bar lines.

<colLayout> → model.milestoneLike.music → <measure>

**<oLayer>** A layer that contains an alternative to material in another layer.

<colLayout> → model.milestoneLike.music → <oLayer>

**<oStaff>** A staff that holds an alternative passage which may be played instead of the original material.

<colLayout> → model.milestoneLike.music → <oStaff>

**<orig>** Contains material which is marked as following the original, rather than being normalized or corrected.

<colLayout> → model.milestoneLike.music → <orig>

**<part>** An alternative visual rendition of the score from the point of view of a particular performer (or group of performers).

<colLayout> → model.milestoneLike.music → <part>

**<rdg>** (reading) – Contains a single reading within a textual variation.

<colLayout> → model.milestoneLike.music → <rdg>

**<reg>** Contains material which has been regularized or normalized in some sense.

<colLayout> → model.milestoneLike.music → <reg>

**<restore>** Indicates restoration of material to an earlier state by cancellation of an editorial or authorial marking or instruction.

<colLayout> → model.milestoneLike.music → <restore>

**<score>** Full score view of the musical content.

<colLayout> → model.milestoneLike.music → <score>

**<section>** Segment of music data.

<colLayout> → model.milestoneLike.music → <section>

**<series>** Contains information about the serial publication in which a bibliographic item has appeared.

<colLayout> → model.milestoneLike.text → <series>

**<sic>** Contains apparently incorrect or inaccurate material.

<colLayout> → model.milestoneLike.music → <sic>

**<sp>** Contains an individual speech in a performance text.

<colLayout> → model.milestoneLike.text → <sp>

**<staff>** A group of equidistant horizontal lines on which notes are placed in order to represent pitch or a grouping element for individual 'strands' of notes, rests, etc. that may or may not actually be rendered on staff lines; that is, both diastematic and non-diastematic signs.

<colLayout> → model.milestoneLike.music → <staff>

**<supplied>** Contains material supplied by the transcriber or editor for any reason.

<colLayout> → model.milestoneLike.music → <supplied>

**<syllable>** Neume notation can be thought of as "neumed text". Therefore, the syllable element provides high-level organization in this repertoire.

<colLayout> → model.milestoneLike.music → <syllable>

**<titlePage>** Contains a transcription of the title page of a text.

<colLayout> → model.milestoneLike.text → <titlePage>

**<unclear>** Contains material that cannot be transcribed with certainty because it is illegible or inaudible in the source.

<colLayout> → model.milestoneLike.music → <unclear>

## May Contain

– (<colLayout> may not have child elements)

## Declaration

```

## <collation>

Records a description of how the leaves or bifolia of an item are physically arranged.

### Module

[MEI.msDesc](#)

### Attributes

**@analog** (*optional*) Contains a reference to a field or element in another descriptive encoding system to which this MEI element is comparable. Value is plain text.

<collation> → [att.bibl](#) → @analog

**@class** (*optional*) Contains one or more URIs which denote classification terms that apply to the entity bearing this attribute. One or more values from [data.URI](#), separated by spaces.

<collation> → [att.common](#) → [att.typed](#) → [att.classed](#) → @class

**@copyof** (*optional*) Points to an element of which the current element is a copy. Value conforms to [data.URI](#).

<collation> → [att.common](#) → [att.linking](#) → @copyof

**@corresp** (*optional*) Used to point to other elements that correspond to this one in a generic fashion. One or more values from [data.URI](#), separated by spaces.

<collation> → [att.common](#) → [att.linking](#) → @corresp

**@follows** (*optional*) points to one or more events in a user-defined collection that are known to be predecessors of the current element. One or more values from [data.URI](#), separated by spaces.

<collation> → [att.common](#) → [att.linking](#) → @follows

**@label** (*optional*) Captures text to be used to generate a label for the element to which it's attached, a "tool tip" or prefatory text, for example. Should not be used to record document content. Value is plain text.

<collation> → [att.common](#) → [att.labelled](#) → @label

**@n** (*optional*) Provides a number-like designation that indicates an element's position in a sequence of similar elements. May not contain space characters. Value conforms to [data.WORD](#).

<collation> → [att.common](#) → [att.nNumberLike](#) → @n

**@next** (*optional*) Used to point to the next event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<collation> → [att.common](#) → [att.linking](#) → @next

**@precedes** (*optional*) Points to one or more events in a user-defined collection that are known to be successors of the current element. One or more values from [data.URI](#), separated by spaces.

<collation> → [att.common](#) → [att.linking](#) → @precedes

**@prev** (*optional*) Points to the previous event(s) in a user-defined collection. One or more values from [data.URI](#), separated by spaces.

<collation> → [att.common](#) → [att.linking](#) → @prev

**@resp** (*optional*) Indicates the agent(s) responsible for some aspect of the text's transcription, editing, or encoding. Its value must point to one or more identifiers declared in the document header. One or more values from [data.URI](#), separated by spaces.

<collation> → [att.common](#) → [att.responsibility](#) → @resp

**@sameas** (*optional*) Points to an element that is the same as the current element but is not a literal copy of the current element. One or more values from [data.URI](#), separated by spaces.

<collation> → [att.common](#) → [att.linking](#) → @sameas

**@synch** (*optional*) Points to elements that are synchronous with the current element. One or more values from [data.URI](#), separated by spaces.

<collation> → [att.common](#) → [att.linking](#) → @synch

**@translit** (*optional*) Specifies the transliteration technique used. Value is a [NMTOKEN](#).

<collation> → [att.lang](#) → @translit

**@type** (*optional*) Designation which characterizes the element in some sense, using any convenient classification scheme or typology that employs single-token labels. One or more values of datatype [NMTOKEN](#), separated by spaces.

<collation> → [att.common](#) → [att.typed](#) → @type

**@xml:base** (*optional*) Provides a base URI reference with which applications can resolve relative URI references into absolute URI references. Value conforms to [data.URI](#).

<collation> → [att.common](#) → [att.basic](#) → @xml:base

**@xml:id** (*optional*) Regularizes the naming of an element and thus facilitates building links between it and other resources. Each id attribute within a document must have a unique value. Value is a valid [xml:id](#).

<collation> → [att.common](#) → [att.basic](#) → [att.id](#) → @xml:id

**@xml:lang** (*optional*) Identifies the language of the element's content. The values for this attribute are language 'tags' as defined in BCP 47. All language tags that make use of private use sub-tags must be documented in a corresponding language element in the MEI header whose id attribute is the same as the language tag's value. Value is a [language](#).

<collation> → [att.lang](#) → @xml:lang

## Member of

(collation isn't member of any model class)

## Contained By

**<supportDesc>** Groups elements describing the physical support material of an item.

<collation> → elements having collation as direct children → <supportDesc>

## May Contain

**<abbr>** A generic element for 1) a shortened form of a word, including an acronym or 2) a shorthand notation.

<collation> → [macro.struc-unstrucContent](#) → [model.textPhraseLike.limited](#) → [model.editorialLike](#) → <abbr>

**<address>** Contains a postal address, for example of a publisher, an organization, or an individual.

<collation> → [macro.struc-unstrucContent](#) → [model.textPhraseLike.limited](#) → [model.addressLike](#) → <address>

**<annot>** Provides a statement explaining the text or indicating the basis for an assertion.

<collation> → [macro.struc-unstrucContent](#) → [model.textPhraseLike.limited](#) → [model.annotLike](#) → <annot>

**<bibl>** Provides a loosely-structured bibliographic citation in which the sub-components may or may not be explicitly marked.

<collation> → [macro.struc-unstrucContent](#) → [model.textPhraseLike.limited](#) → [model.biblLike](#) → <bibl>

**<biblStruct>** Contains a bibliographic citation in which bibliographic sub-elements must appear in a specified order.

<collation> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.biblLike → <biblStruct>

**<bloc>** Contains the name of a geopolitical unit consisting of two or more nation states or countries.

<collation> → macro.struc-unstrucContent → model.textPhraseLike.limited → model.addressPart → model.geogNamePart → <bloc>
